PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $5 million for individual doctors and $7.5 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

One Minute With Diabetes

The Diabetic Runner

Doctor, how can an insulin-dependent diabetic patient prepare for a 10K race?

In a race the symptoms of hypoglycemia may not be noticed because runners get a high that makes breakthrough of symptoms difficult to differentiate between hypoglycemia and normal response to exercise. Preparation should consist of running training races similar to a 10K race. Self-monitoring of blood glucose should be done before, at the halfway point, and at the end of the trial or trials.

One should consume extra carbohydrates before the race, for example, gatorade or the like, approximately 135 gm for one hour of strenuous exercise. If orange juice is used, the fluid volume to approximate 135 gm of carbohydrates would be 54 ounces. This amount would approach fluid overload if given all at one time. Therefore it should be divided between start, midpoint, and end of the race. When fruits are used instead of juices, utilization will be slower and probably the blood glucose level more easily managed.

An alternative method is to reduce prerace insulin dose, the amount to be determined by training run results: possibly 10 units. The injection site varies with type of exercise. In running, abdominal injection would be preferable. Injection in the thigh would result in an increased rate of utilization due to the exercise of the site. The blood glucose should be checked 10 to 30 minutes before race and aim for 120-150 mg/dl. (Blood glucose usually drops with exercise if initial test result is less than 350-400 mg/dl.)

Exercise Do and Don'ts

Don't exercise if diabetes is under poor control

Don't change insulin or carbohydrates without monitoring blood glucose

Don't exercise if you have complications that would contraindicate it (for example, heart disease, infected foot, etc.)

Do be careful in choosing carbohydrates to be used before the exercise; bread and fruit are more slowly absorbed than are juices

Exercise in NIDDM Patient

"Diet only" patients need no change from that of a normal individual.

Oral agents plus diet. You may need less carbohydrates to prevent exercise-related hypoglycemia.

TAX RELIEF

Have You Ever Earned Interest on Taxes You Paid to the IRS?

You can have Interest Bearing Savings and pay tax on the annual interest or defer the tax

For example:

		$100,000 Bank Deposit *Earning 9% (Taxable)*	vs	$100,000 Insurance Company *Earning 9% (Tax Deferred)*
Account Value *				
Year	10	$169,202		$ 236,735
	20	286,294		560,435
	30	484,416		1,326,745

Annual Income assuming 9% interest and no depletion of principal:

484,416 x 9% = 43,597 vs 1,326,745 x 9% = 119,407

It's a basic principle: The greater your principal, the greater your income. This is accomplished through tax deferral rather than current taxation.

* Tax Bracket Assumed = 40%

What is PDS?

PDS is a professional service company for physicians. PDS helps the physician obtain the best benefit for the disabled patient who is applying for Social Security Disability Insurance benefits or seeking vocational rehabilitation.

- **Team up with PDS** and help disabled patients get benefits sooner. You examine the patient, order tests, and furnish results to a nurse from our directory.
- **You receive a typed disability report,** reviewed by a professional, ready for your signature, with full supporting medical documentation.
- **PDS frees you from paperwork,** yet assures that you can file a thorough, timely disability report with Social Security.

Estrogen Replacement Therapy: Risk /Benefit Ratio for Treatment

Gerald A. Glowacki MD

Dr. Glowacki is Chairman, Department of Obstetrics and Gynecology, Franklin Square Hospital Center, and Assistant Professor, Department of Obstetrics and Gynecology, The Johns Hopkins Hospital, Baltimore.

With very few exceptions, the vast majority of post menopausal women are candidates for estrogen replacement therapy.

Although osteoporosis was first described in 1941, researchers have yet to adequately define the mechanisms responsible for this bone-depleting malady. At present, there are no known biochemical abnormalities associated with the development of osteoporosis. In fact, while most investigators agree that osteoporotic bone is reduced in quantity, the bone itself is essentially normal in chemical composition.

There are, however, a number of drugs as well as endocrine, dietary, and malabsorptive syndromes that are associated with osteoporosis. Corticosteroids, cytotoxic agents, and heparin have been demonstrated as causing bone mineral loss. Hyperthyroidism, primary hyperparathyroidism, and Cushing's syndrome are causative endocrine diseases, while alcoholism, smoking, vitamin C deficiency, and upper gastrointestinal tract surgery (gastric stapling) are among the dietary and malabsorptive factors associated with osteoporosis. In addition, chronic renal failure, vitamin D deficiency, rheumatoid arthritis, and immobilization and weightlessness are additional factors.

Prevalence of Osteoporosis and Related Fractures

In both sexes, peak bone mass is reached at about age 35, at which point either a plateau is maintained or a downward slope begins. The subsequent development of osteoporosis, however, is much more common in women than in men. For example, symptomatic spinal osteoporosis is about 4 times as common in women as in men, while hip fractures are about 2.4 times as common.

In a study of the prevalence rates of osteoporosis in Michigan women over the age of 45, investigators found that between the ages of 45 and 49 approximately 18 percent of these women had osteoporosis.[1] Between ages 50 and 75, there was an additional 15 to 20 percent incidence of osteoporosis detected per five-year period. Finally, by age 75, 90 percent of these women had significant osteoporosis.

This increasing rate of osteoporosis translates into a significant number of fractures among both men and women. That is, 80

percent of all hip fracture patients have preexisting osteoporosis. The risk of hip fracture is at least 20 percent by age 90. It is important to note that one-sixth of these patients will die within three months of the fracture. In the United States, it is estimated that over 120,000 hip fractures occur in elderly women each year. The cost of treating these fractures, which are thought to result in 50,000 deaths per year, exceeds $2 billion annually.

In addition to hip fracture, approximately 25 percent of all white women over age 60 have spinal compression fractures due to osteoporosis, and up to 50 percent of women will develop vertebral fractures by age 75. After age 45, there is a marked increase in the incidence of distal forearm fractures, and by age 60, there are 10 times more forearm fractures in women than in men of comparable age.

Diagnosis of Osteoporosis

Osteoporosis can be divided into two diagnostic categories, postmenopausal (type I) and senile (type II). The onset of postmenopausal or type I osteoporosis most often correlates with menopause or castration.[2,3] It affects trabecular bone more significantly than cortical bone and, therefore, the main site of fracture is often the vertebrae. The primary cause of fracture is related to estrogen deficiency as well as to the decreases in calcium absorption and parathyroid function.

In senile (type II) osteoporosis, the age of onset is generally 65 and older. Overall in senile osteoporosis there is a 2:1 female-to-male ratio of fractures and, as opposed to type I osteoporosis, trabecular and cortical bone are lost in equal amounts. The main sites of fracture are hips and other long bones, although causative factors other than aging have not yet been delineated. Calcium absorption, which is associated with an increase in parathyroid function, is decreased in senile osteoporosis. It should be noted that dietary calcium supplementation has been associated with decreased bone loss in this type of osteoporosis.

Diagnostic Techniques A variety of noninvasive techniques have been used for the measurement of bone mass.[4] These include plain radiographs, quantitative radiographs, single and dual photon absorptiometry, computed tomography, and neutron activation analysis:

1. Plain radiographs are not sufficiently sensitive to determine osteoporosis until at least 65 percent of bone mass is lost. Diagnostic applications, therefore, are limited.

2. Quantitative radiography was among the methods first used to quantify bone density. This technique uses a step wedge aluminum equivalent and measures the third metacarpal bone mass.

3. Newer techniques, including single and dual photon absorptiometry, are now being used. Both single and dual photon absorptiometers measure trabecular and cortical bone but are unable to differentiate the mineral loss of these two entities. Single photon absorptiometry is used to measure radius, ulna, patella, or os calcis for bone density. However, a reliable quantitative relationship between bone density of these structures and fracture risk rates has not yet been established. On the other hand, dual photon absorptiometry, measuring lumbar spine, femoral neck, and trochanter, has demonstrated an excellent quantitative relationship between bone mineral content and fracture rate in the structures measured. Both single and dual photon absorptiometry deliver less than 10 mrem of radiation. The average cost of a single photon absorptiometry study is about $125, while a dual photon study, including spine and femoral head, ranges in cost from $125 to $250.

4. Computed tomography with either single or dual energy sources affords excellent evaluation of bone mineral density of both cortical and trabecular bone, and the quantitative relationship between bone mineral density and risk ratio for fractures is excellent. Computed tomography does require higher levels of irradiation (between 250 and 500 mrem), and cost of the procedure is generally in the range of $250.

5. Neutron activation analysis affords excellent bone mineral density measurements in both cortical and trabecular bone of all skeletal sites. It requires high levels of irradiation, between 150 and 2000 mrem and, hence, is used primarily in research.

Estrogen Production and Replacement Therapy

Estrogen Production In the premenopausal woman, the ovary is the primary site of estrogen production in the form of estradiol, while in the postmenopausal woman, very little or no estradiol production occurs in the ovary. Estrogen is also produced via the adrenal, which manufactures adrenostenedione, the primary precursor of estrogen. The conversion of androstenedione to estrogen then occurs in many tissues including skin, fat, and muscle.

There is a significant correlation between postmenopausal estrogen production and body weight. Postmenopausal women who are 25 percent above ideal weight generally produce significant levels of estrogen. This reduces the risk of osteoporosis in these individuals, while it simultaneously increases their risk of endometrial cancer. Bone mineral studies on a biannual basis in the obese postmenopausal woman may obviate the necessity of exogenous estrogen replacement. If adequate endogenous estrogen production is confirmed by these studies, periodic progestational challenge therapy to the endometrium is warranted.[5]

Estrogen Replacement Therapy Almost since the discovery of osteoporosis, estrogen therapy has been used in its treatment. Some of the earliest published reports used the simple technique of measuring height in postmenopausal women. That is, the estrogen-treated group maintained height, while controls lost an average of 2.5 inches in height over a 15-year period.

Recent studies delineating the role of estrogen in osteoporosis have shown that women who become amenorrheic due to anorexia have significant bone mineral loss as a result of decreased estrogen production.

A number of important studies have clearly defined the role of estrogen replacement therapy in the treatment of osteoporosis. Nordin and colleagues published a linear study of postmenopausal women treated with various combinations of agents including estrogen alone, estrogen plus 1 alpha vitamin D, calcium, vitamin D plus calcium, 1 alpha vitamin D, and vitamin D alone.[6] Mean metacarpal cortical bone density was used as the determinant of therapeutic efficacy. Only estrogen and estrogen-containing regimens maintained or augmented the mean metacarpal cortical bone mass.

Lindsay and colleagues have been responsible for some of the most significant studies of the long-term prevention of postmenopausal osteoporosis by estrogen therapy. In the first study, they reported on the measurement of metacarpal mineral change on an annual basis in women receiving either mestranol (a 3-methyl ester of ethinyl estradiol) or placebo, starting two months, three years, or six years after oophorectomy.[7] In all three groups, a significant decrease in metacarpal mineral density was noted at the beginning of the study. In the mestranol-treated patients two months and three years post-oophorectomy, metacarpal density was either maintained or augmented. However, in those patients six years post-oophorectomy, bone mineral density was not significantly different in the mestranol-treated group than in the control group. This has lead to an important speculation: major biochemical and/or structural defects may occur in bone that are not reversed with estrogen therapy if postmenopausal osteoporosis is not treated within six years of menopause or castration. The investigators then withheld estrogen therapy in a group of these women and followed them over an additional four years.[8] In the women in whom the mestranol therapy was discounted, there was an abrupt and dramatic loss of metacarpal bone mineral content. By the end of the four-year period of mestranol densities equivalent to control patients who had never received estrogen replacement therapy. This has given considerable support to the concept of continual treatment with estrogen in postmenopausal and castrated women.

Combination Therapy Several regimens of estrogen alone, estrogen plus calcium, or estrogen plus calcium and sodium fluoride have been evaluated in relation to fracture rates in the postmenopausal woman.[9,10] Calcium supplementation at a level of 1500 mg of calcium carbonate daily decreased the fracture rate by 50 percent per 1,000 years observed. An additional 75 percent decrease in the fracture rate was noted with the addition of 40 mg of sodium fluoride daily to the treatment regimen. Unfortunately, the majority of individuals in the study were unable to tolerate the sodium fluoride therapy because of gastrointestinal irritation. In individuals with preexisting osteoporosis who either have a high-risk rate for fracture or have had fractures, an estrogen, calcium, and sodium fluoride regimen should be considered. In all women over the age of 35, supplementary calcium therapy in the range of 1000 to 1500 mg daily should be advocated. The average dietary intake of calcium is from 400 to 800 mg per day.

Recent studies on the chronic use of thiazide diuretics in relation to postmenopausal bone mineral content in both estrogen-treated and untreated groups have been reviewed.[11] Administration of thiazides over a period of years was associated with significantly higher bone mineral content. Long-bone fracture prevalence was decreased by 50 percent compared to a control group receiving no thiazide therapy. The thiazide apparently increased bone mineral content at both trabecular and cortical sites, while estrogen was associated with greater bone mineral content in sites containing trabecular bone only. This is of significant interest because the head of the femur, where hip fractures often occur, is cortical bone and therefore is relatively unaffected by estrogen therapy. Thiazides apparently work by causing decreased urinary calcium excretion, thus maintaining a lower rate of calcium resorption. Since hip fractures are the major factor contributing to the morbidity and mortality related to osteoporosis in the aging population, thiazides may be an additional tool in the prevention of nontraumatic hip fractures.

Estrogen Dosing Regimens Several studies have been conducted to clarify the threshold dose at which various estrogen products are effective in preserving bone mineral content. Conjugated estrogen at a daily dosage of 0.625 mg, ethinyl estradiol at 10 mcg daily, and a new transdermal estradiol product at 0.05 mcg daily have been shown to be effective at these dosing schedules.

Risks/Benefits of Estrogen Replacement

A number of clinically significant risks have been associated with the use of estrogen replacement therapy including endometrial and breast cancer. At the same time, however, a number of studies have indicated significant benefits in the reduction of coronary artery disease via protective effects of estrogen and associated improvements in the lipid profile. It is therefore important for the primary care physician to evaluate this mode of therapy in relation to this risk/benefit ratio.

Endometrial Cancer A positive correlation between estrogen therapy and endometrial cancer has been observed since the 1970s.[12] The risk of developing endometrial cancer in the postmenopausal population is approximately 1 woman per 1,000 per year. With the use of estrogen replacement therapy alone, the relative risk rate increases from the above stated figure to between 4 to 9 women per 1,000 per year.[13] But with the addition of progesterone therapy to the estrogen

regimen in postmenopausal women with a uterus *in situ*, several studies have shown that the relative risk for developing endometrial carcinoma is reduced to the control level or below.[14]

Breast Cancer To date, a number of case control studies on exogenous estrogen and breast cancer have been conducted.[15,16] The vast majority of these reports have substantiated the fact that exogenous estrogen is associated with an increased risk rate of developing breast cancer in the range of 1.1 to 1.2. This risk ratio, however, has only been demonstrated in long-term users (greater than 10 years) of estrogen replacement therapy.

Protection from Coronary Artery Disease For a significant period of time, there has been speculation within the medical community as to possible beneficial effects of estrogen therapy in the prevention of coronary artery disease. As early as 1968, Ferment published a graphic representation of the discrepancies in death rates from coronary artery disease between white males and females through age 85. This has led a number of observers to speculate about the protective mechanisms of estrogen in the premenopausal age group of women.

Henderson and colleagues recently published a report on long-term estrogen replacement therapy, cardiovascular disease, and acute myocardial infarction.[17,18] The longitudinal study included data gathered on 8,841 females between age 44 and 101 years. These case control and cohort studies demonstrated that long-term estrogen users (greater than 5 years) experienced a 25 to 40 percent reduction in acute myocardial infarctions (95 percent confidence intervals 0.1 to 0.8). Protection against acute myocardial infarction was conveyed, to a comparable degree, to women with cardiovascular disease risk factors including cigarette smoking, obesity, stroke, hypertension, diabetes, angina and, most importantly, previous myocardial infarction.

Gruchow and associates recently published data on coronary artery occlusion in estrogen and nonestrogen users.[19] Utilizing coronary angiography, their study demonstrated that estrogen users had significantly less frequent and less severe coronary artery occlusive disease. This protection was, again, independent of other risk factors, as enumerated above. The increased high-density lipoprotein (HDL) cholesterol levels among estrogen users was attributed as a probably biologic mechanism by which postmenopausal estrogen use lowers the risk of coronary occlusion.

Several studies on estrogen replacement therapy and lipid values have been conducted that correlate total cholesterol (TC), HDL, low-density lipoprotein cholesterol (LDL), and triglycerides with the incidence of coronary artery disease. These studies clearly show that oral estrogen replacement therapy in postmenopausal women decreases TC, LDL, and triglycerides, while increasing HDL. The mechanism postulated for these changes in lipid profile is through the gastric absorption and first passage of this drug through the liver, that is, via the gastrohepatic circulatory pathway. Hepatolipase A activation with oral estrogen is believed to be the mechanism of action. Studies to date with transcutaneous estrogen replacement do not demonstrate similar lipid changes since the gastrohepatic pathway is bypassed, at least on the initial pass from the skin directly to the target organs. With the addition of medroxyprogesterone acetate to a monthly regimen of estrogen replacement, HDL levels are lowered. This adverse effect suggests that any oral progestational agent be kept at the lowest possible dose and be used for the least amount of time during the menstrual cycle.

Additional Benefits of Estrogen Further benefits of estrogen to the genitourinary and central nervous systems have been documented. These include the alleviation of hot flushes, which are secondary to vasomotor instability, the preservation of vaginal mucosal integrity, and the alleviation of vaginal dryness. The enhancement of REM sleep has been similarly documented with estrogen replacement therapy. Although case control studies have not shown that estrogen replacement therapy and its effect on the vaginal mucosa and other supporting structures have prevented vaginal prolapse, theoretically, it may play an alleviatory role.

Conclusions

From the liberal, poorly controlled use of estrogen replacement therapy in the postmenopausal female in the 1960s and early 1970s, wherein the annual sales of estrogen were the highest of all drugs, to the cancer scare period of the late 1970s and early 1980s when many physicians stopped advocating estrogen replacement for these patients, physicians have now settled on a more scientific and logical approach to the use of estrogen replacement therapy.

With very few exceptions (including patients with breast cancer, positive estrogen receptors, advanced endometrial carcinoma, and recurrent thrombophlebitis), the vast majority of postmenopausal women are candidates for estrogen replacement therapy.

For a patient with a uterus *in situ*, a therapeutic regimen that consists of estrogen on a daily basis with the addition of a progestational agent for the first 10 days of the month has proved to be most effective. In approximately 80 percent of individuals so treated, withdrawal bleeding will occur on a cyclic basis. Patients need to be counseled that this is a normal and expected phenomenon. Endometrial sampling should be reserved for those patients having withdrawal bleeding that is excessive or that occurs during the estrogen or early progesterone portion of the treatment cycle.

For patients without a uterus, estrogen replacement

ing that is excessive or that occurs during the estrogen or early progesterone portion of the treatment cycle.

For patients without a uterus, estrogen replacement should consist of daily estrogen alone. The addition of a progestational agent has not been shown to be of significant benefit, particularly in relation to the reduction in the incidence of breast cancer. Conversely, the addition of a progestational agent has been shown to diminish the favorable TC/HDL cholesterol ratio of estrogen alone.

There has been recent interest and research on the bioequivalence of the various conjugated estrogen products available. Premarin, a biologically prepared product from pregnant mares' urine, has a number of estrogen sulfate components. Equilin, one of these components, has been shown to be a potent estrogenic agent that may well distinguish this product more favorably as a substantial estrogenic hormone. The ethinyl estradiol as well as the micronized estradiol products are converted, in the main, to estrone through the enterohepatic pathway before reaching target organs.

With patients on adequate estrogen and calcium replacement therapy, routine evaluation of bone mineral density is unwarranted. Since dual photon absorptiometry is the most cost-effective and informative methodology for this determination, it should be used to follow the obese patient, who may not require estrogen replacement therapy, or the patient who must be convinced that preexisting and/or progressive osteoporosis is present. Since progestational agents alone have been documented to reduce bone mineral loss, this should be considered together with calcium supplementation for the breast and endometrial cancer patients who are not candidates for estrogen therapy.

Adverse Events Following DTP Immunization in Maryland, 1987

Mohammed A. Siddiqui MD; Feng-Y. Lin MD, MPH; Barry Trostel; Ebenezer Israel MD, MPH; and Diane M. Dwyer MD

Drs. Siddiqui, Dwyer, Israel and Mr. Trostel are at the Epidemiology and Disease Control Program, Maryland Department of Health and Mental Hygiene, 201 W. Preston St., Baltimore. Dr. Lin is with Agency for International Development, Washington, DC.

Between January 1, 1987 and December 31, 1987, a total of 184 adverse events were reported to have occurred within 28 days following diphtheria, tetanus, pertussis (DTP) immunization in Maryland. More than half the reports (54 percent) were of serious or major vaccine reactions. Screaming episodes were the most frequently reported serious reaction, having occurred in 64 (35 percent) of the reports.

The objective of immunization is to enhance an individual's immunity against an organism or an endotoxin while incurring minimal side effects. The DTP vaccine is a combination of diphtheria toxoid, tetanus toxoid, and whole cell inactivated *Bordetella pertussis*.[1] The pertussis component of the DTP vaccine may contain whole bacteria, bacterial antigen, or bacterial endotoxin.[2] Administration of any of these components can enhance the immunological response in an individual.

The Immunization Practice Advisory Committee (ACIP) recommends 0.5 ml intramuscular DTP vaccination of children at 2, 4, and 6 months of age, and a fourth dose at approximately 15 months of age.[3] A booster dose before a child enters school or before the seventh birthday is recommended. It has been estimated that the efficacy of DTP vaccine is about 80 percent for pertussis in recipients who have had at least three doses.[1]

Minor and febrile reactions associated with pertussis vaccine are common. Pertussis vaccine has been infrequently associated with serious or major adverse events such as temperature of 105°F and greater, anaphylaxis, arthritis/arthralgia, seizures, encephalitis/encephalopathy, Guillian-Barré syndrome, Reye's syndrome, paralysis, screaming episodes, hypotonic hyporesponsive episodes, other neurological symptoms, and death.

As early as 1979, the Centers for Disease Control (CDC) recommended reporting of all vaccine reactions occurring within 28 days after immunization with vaccine purchased with public funds, if the reaction was more severe than a local reaction and if the patient was seen by a physician. Reactions were to be reported to the local health department or to the Maryland Department of Health and Mental Hygiene Monitoring System for Adverse Events Following Immunization (MSAEFI) Program. In May 1986 an additional state regulation on pertussis disease and pertussis vaccine became effective in Maryland.[4] This regulation required public and private health care providers to report major vaccine reactions occurring within seven days following pertussis immunization.

Although not required, some clinicians have reported minor vaccine reactions to the Maryland MSAEFI program.

We present the analysis of vaccine adverse event reports received by the Maryland MSAEFI program following administration of DTP vaccine between January 1, 1987 and December 31, 1987.

Methods

Within 24 hours of receiving an adverse event report, the local health department initiates an investigation and completes information on a Centers for Disease Control vaccine adverse event report form (CDC 71.19). The CDC report form contains information about the source of vaccine (public or private), type of vaccine given, vaccine manufacturer, vaccine lot number; a description of the clinical symptoms (including personal or family history of seizures), and any occurrence of reaction to the previous immunization. The information is obtained from either the reporting physician by telephone or from the parent/guardian by telephone or a home visit. Permission is obtained from the attending physician before contacting the parent. When the investigation is completed, the report is submitted to the MSAEFI program for review and analysis. If information is missing on the report form, the MSAEFI program coordinator contacts the local health department or the reporting physician to obtain complete information.

Reactions were defined by the occurrence of one or more symptoms occurring within 28 days of immunization, whether or not the child was seen by a doctor. A screaming episode was defined as high-pitched abnormal crying or unconsolable crying lasting at least 3 hours as reported by the physician or the parent. A hypotonic hyporesponsive episode (HHE) was defined as an unusual reaction characterized by paleness, hypotonia, and unresponsiveness occurring within 10 hours of vaccination and lasting 10 minutes to 36 hours.

Reaction rates were calculated for the public sector by using the total number of DTP vaccine doses administered at public clinics. Rates for private reports were calculated using the estimated number of doses administered by the private providers. The number of DTP immunizations given by private physicians was estimated by subtracting the number of doses of DTP vaccine administered by public clinics from the estimated total number of DTP doses given during 1987. The total number of DTP doses given in 1987 was approximated by using the number of children born in Maryland, the average number of DTP doses per child, and the estimated percentage of children immunized.

All MSAEFI reports were entered into a computerized data base for analysis. Probability values for two-by-two tables were calculated by the chi square test.

Results

A total of 184 children with adverse events following administration of DTP vaccine were reported among infants and children (ages 0 to 7 years) between January 1, 1987 and December 31, 1987. This was a 104 percent increase over the preceding four-year mean of 90 reports per year. Private providers reported 72 adverse events (as compared to 24 reports in 1986) and public providers reported 112 (Table 1). These adverse events occurred following administration of approximately 259,000 doses of DTP vaccine (41,000 doses administered by public health care providers and an estimated 218,000 doses administered by the private health care providers).

The rate of reporting by public provider was over eight times greater than by private providers (approximately 273.2/100,000 vs 33.02/100,000, respectively). The MSAEFI program received reports from 17 of the 23 Maryland counties and from Baltimore City. Reaction rates by county ranged from zero to 2206.6/100,000 doses, with a median rate of 120/100,000 doses administered in the public sector. The public clinic in county A with the highest rate reported 27.7 percent of all reactions reported in 1987. Privately administered vaccine reaction rates ranged from zero to 196.3/100,000 doses administered with a median rate of 4.1/100,000 doses. Although the overall rate of reported adverse events was higher for publicly administered vaccine, there was no difference between public and private reports in the percentage of reported events classified as serious events ($p = 0.25$) or in the percentage who saw a physician following the vaccine reaction ($p = 0.33$).

Table 1. Reported Reaction Rates and Percent of Children Examined by Physician Categorized by Source of Vaccine and Type of Reaction Maryland, January 1, 1987 - December 31, 1987

Reaction Type	Source of Vaccine								Total			
	Private				Public							
	Number	Seen by MD n	(%)	Rate*	Number	Seen by MD n	(%)	Rate**	Number	Seen by MD n	(%)	Rate*
Serious	43	12	(28)	19.7	56	20	(36)	136.6	99	32	(32)	38.2
Minor	29	11	(38)	13.3	56	25	(45)	136.6	85	36	(42)	32.8
Total	72	23	(32)	33.0	112	45	(40)	273.2	184	68	(37)	71.0

* rate per 100,000 doses DTP estimated to have been administered by private providers
** rate per 100,000 doses DTP administered in public clinics

Most children with adverse events had received DTP vaccine and other vaccines simultaneously. Of the 184 reports, 60 (33 percent) vaccine recipients received DTP vaccine alone; 109 (59 percent) had DTP and OPV; 12 (6 percent) had DTP, OPV and other vaccines (for example, Hib, MMR, etc.); and the remaining 3 (2 percent) cases had been given DTP and other vaccines.

Table 2 presents the frequency of adverse events following DTP vaccination. Reactions are categorized by the most severe reaction reported. Minor reactions were reported to have occurred in 85 (46 percent) children. Ninety-nine (54 percent) of the reports were classified as serious or major adverse events, with a rate of approximately 38.2 reports for every 100,000 doses of DTP vaccine administered. Screaming episodes were the most frequently occurring serious adverse event, occurring in 64 (65 percent) of the reported serious events. Ten (10 percent) seizures, 9 (9 percent) hypotonic hyporesponsive episodes (HHE), 7 (7 percent) other neurological symptoms, 8 (8 percent) fever cases of 105°F or greater, and one case of arthralgia/arthritis were reported as the most severe event.

Table 3 provides details of the three most severe reactions: screaming episodes, seizures, and hypotonic hyporesponsive episodes. Screaming episodes occurred in 64 children for a rate of approximately 24.7 cases/100,000 doses of DTP vaccine. The median age of a case was 4 months (range 1 month to 43 months). Most of the screaming episodes occurred within one day of vaccination. Only 15 (23 percent) saw a physician because of the reaction. Of the 64 screaming episodes, 20 (31.3 percent) were reported by one public clinic, county A, which administered 4.9 percent of the total publicly administered DTP vaccine.

Ten children had seizures following DTP vaccination, with a rate of approximately 3.9 cases/100,000 doses administered. These children ranged from 1 month to 28 months old, with a median age of 11.5 months. Seven cases had elevated temperature. None had a prior history of seizures or neurological illness. One case had a family history of seizures. Three cases had history of reactions to prior vaccination (one had a serious reaction, and two were minor reactions). In 8 of the 10 cases, onset of seizures took place within 24 hours of immunization, and two cases had onset seven days following immunization. Three cases had been given MMR vaccine simultaneously with DTP vaccine: two had seizures within 24 hours of immunization and one had seizures seven days following immunization. Nine of the ten children with seizures were seen by a physician. One child who developed seizures seven days after receiving DTP and OPV was later diagnosed as having cerebral infarcts and cerebral palsy; the seizures were temporally but probably not causally related to DTP immunization.

Nine cases of hypotonic hyporesponsive episodes (HHE) following DTP vaccination were reported, with a rate of approximately 3.5 cases/100,000 doses administered. These cases ranged in age from 1 month to 42 months, with a median age of 4 months. None of these children had any history of seizure activity or neurological illness prior to immunization. One child had a local reaction to a previous vaccination, and another had a family history of seizures. Seven of the 9 cases experienced elevated temperature (average temperature was 102.1°F). Hypotonic hyporesponsive episodes frequently occurred following the first dose of DTP vaccination. Two of the nine were seen by a physician because of the reaction.

We determined the outcome of the adverse events at 30 days following immunization for 180 (98 percent) of the reported events. Four cases could not be located for follow-up. One-hundred seventy-six children (98 percent) were fully recovered. The remaining four were partially recovered; one had cerebral palsy determined by the physician to be unrelated to immunization, one had a residual abscess, one had asthma, and one was described to have irritability.

The MSAEFI system identified no lots of vaccine that had to be recalled because of elevated reaction rates.

Table 2. Adverse Events Reported following DTP Immunization Categorized by Most Severe Event January 1, 1987 - December 31, 1987, Maryland

Type of Reaction	# of Reports	% of Total
Serious adverse events (N=99)		
Convulsions	10	4
HHE*	9	5
Screaming episodes	64	35
Other neurologic symptoms	7	4
Arthritis/arthralgia	1	1
Fever (=105°F)	8	4
Minor adverse events (N=85)		
Rash	6	3
Adenopathy	2	1
Allergy	3	2
Fever (100°F - 104.9°F)	45	24
Other minor events	21	12
Local reactions	8	4
Total	184	100

* HHE Hypotonic hyporesponsive episode

Discussion

In the first year following a Maryland law requiring reporting of major vaccine reactions following pertussis immunization, public and private sector health care providers reported 184 adverse events following DTP immunization. Although the 104 percent increase over the preceding four-year average was largely due to increased reporting by the private sector, private health care providers are still underreporting, compared to public providers. Marked variation also was seen among counties, with the public clinic in one county reporting 27.7 percent of all vaccine reactions in the state, a rate 18 times the public sector median.

The county that reported a significantly higher number of adverse events following immunization was investigated. The high rate of reactions was not due to different vaccine lots being administered in that county, and staff were found to be using standard vaccine administration techniques. The high rate of reactions may have been due to increased surveillance for vaccine adverse events or more active parent education about pertussis side effects and, thus, better reporting of adverse events by parents.

The Maryland law did not specifically define the reactions to be reported. Many reactions require subjective interpretations on the part of the parent or health care provider. Additionally, some providers may still be unaware of the requirement to report. Our data illustrate that parents, clinicians, and counties have different definitions for various vaccine reactions, and set different thresholds for reporting. These differences are reflected in the reported vaccine reaction rates. It must be emphasized that the occurrence of an adverse event within 28 days after administration of vaccine is not necessarily confirmation of a causative relationship and may, in fact, be only temporally associated.

Rates of screaming episodes, seizures, and HHE that are reported here were approximately ten times lower than those reported in prospective DTP vaccine studies,[5-9] but higher than the rate of 1:800,000 reported to one vaccine manufacturer.[10]

The Maryland reporting system is a passive surveillance system and, as such, all vaccine reactions are not reported. The calculated rates of reported reactions lack precision since the denominator is, by necessity, only an estimate of the total number of doses administered. However, passive reporting plays an important role in identifying types and relative frequencies of reactions, in monitoring trends, and possibly in identifying lots of vaccine associated with high rates of reactions. Our experience is particularly timely in light of the National Vaccine Injury Act passed in 1988.[11] The act makes major reactions following certain vaccines reportable. Other states can expect more than a doubling of reports, if our experience with DTP is repeated.

Diphtheria, tetanus, and pertussis vaccine continues to be a safe and effective vaccine. No cases of encephalitis or death due to DTP were reported in Maryland in 1987. Research on an acellular vaccine of greater efficacy and fewer side effects is under way.[12]

Table 3.
Characteristics of Total Adverse Event Reports and Selected Serious Adverse Event Reports January 1, 1987 - December 31, 1987, Maryland

Changes and Challenges for the Practitioner

James P.G. Flynn MD, MPH and Ebenezer Israel MD, MPH

Dr. Flynn is Director/CEO Montebello Rehabilitation Hospital, University of Maryland Medical System. Dr. Israel is Director of Epidemiology, State of Maryland Department of Mental Health and Hygiene.

We continue to advance our knowledge regarding susceptible hosts. As people live longer, society is faced with a new problem of dealing with ever-increasing numbers of elderly with inadequate immune defense. HIV infections, cancer drugs, and steroids continue to add more persons to this pool. As we prepare to move into the twenty-first century, historical perspectives on our past triumphs and failures allow us to feel confident to meet the challenges ahead in preventing life-threatening illnesses in persons with immune deficiency.

With the advent of chemotherapy, dramatic changes have occurred in the treatment and prevention of transmission of tuberculosis. Fortunately childhood tuberculosis is a rarity to the average practitioner in the community; however, if undetected and not treated adequately, disastrous results can ensue. One must remember that identification of the source of the mycobacterial organisms and rapid reporting of the identified case (so that appropriate epidemiological follow-up can occur) are as important as management of the case itself.[1] Although practitioners and the health care delivery system have anticipated the eradication of tuberculosis based on reports from erudite bodies, the downward trend anticipated over the past ten years was recently reversed.[2]

One also might reflect on the changing scene in the use of institutional resources to manage various pathophysiological entities or the challenges facing house staff years ago compared with those of today. The Sydenham Hospital described in the following article no longer meets the standards of licensure or accrediting bodies. It is, in fact, an office building currently housing the headquarters of a research project on osteoporosis, the Baltimore City Geriatric Evaluation Service, the Volunteer/Auxiliary of Montebello Rehabilitation Hospital, and the offices of various members of the health care delivery team of the rehabilitation hospital.

But our Commentary focuses on the major shifts that have occurred in the prevention of communicable diseases. Childhood immunization programs have been extremely successful in eradicating vaccine-preventable diseases. Past experiences in Britain and other countries have illustrated the need to maintain high immunization levels to prevent the reemergence of vaccine-preventable diseases.[3] Surveillance efforts should be sustained: reporting of measles and other vaccine-preventable diseases will assist in containing outbreaks quickly, tantamount to a medical emergency.

The practitioner in the community, official and voluntary agencies, and the city and state medical societies must be recognized for

their major roles in ensuring high levels of immunization in children. The number of rubella, measles, and mumps cases have declined dramatically. The public health emphasis has shifted to students in colleges and high schools who have inadequate immunization. *H.influenza* conjugate vaccine offers an improvement over the disappointing results observed with the old polysaccharide vaccine.[4] Hepatitis B vaccination for babies born to HB-carrier mothers along with hepatitis B immunoglobulin prophylaxis offers protection against neonatal hepatitis B infection.[5] Field trials of vaccines to prevent chickenpox and rotavirus infections are being carried out. Diseases such as meningococcal meningitis are so rare that routine immunization of all children is not considered to be cost effective.

The very successes of vaccines in preventing dreaded childhood diseases have created their own problems. Adverse vaccine reactions and compensations for them have emerged as major health issues.[6] Research efforts are under way to market safer DTP vaccines. Inactivated polio virus vaccine is administered in instances when oral polio vaccine might pose a threat.

Even as we applaud the major advances in the area of childhood immunizations, we recognize the work ahead for all members of the health care delivery team in the area of vaccine-preventable diseases for adults, especially the elderly and the immunocompromised. Over half a million cases and 40 thousand deaths due to pneumococcal disease occur each year in the United States.[7] Studies on pneumococcal vaccine have demonstrated the benefits of the pneumococcal vaccine given to the elderly before their immunological status deteriorates.

Vaccine efficacy studies on the presently available influenza vaccines have been disappointing.[8] Research on influenza vaccines hold promise. Vaccines against gonorrhea, herpes, immunodeficiency syndrome (AIDS), and tuberculosis continue to elude us. Given the rarity of diphtheria and tetanus, it is difficult to justify a large-scale program to vaccinate all adults against these diseases. Persons most at risk for hepatitis B (notably IV drug abusers and homosexual men) are also the hardest to reach before they become infected. Unfounded fears and myths continue to play a major role in the poor acceptance of hepatitis B vaccine for health care workers.[9]

Screening has played an important role in reducing the incidence of tuberculosis and gonorrhea. The tuberculosis mortality has declined so dramatically that the State Health Department no longer recommends routine tuberculin screening except under certain selected circumstances. Diagnostic tools such as plasmid profiles, DNA probes, and rapid test kits are becoming routine. Even as the microorganisms continue to develop resistance to existing chemotherapy, newer drugs are being discovered. History has taught us a painful lesson regarding the adaptability of the microorganism to all the chemotherapy we have to offer to the patient. We are afraid that ciprofloxacin, our latest wonder drug, will not prove to be an exception to the rule.

AIDS justifiably is called the epidemic disease of the twentieth century. With its protean manifestations HIV infection already has replaced syphilis as the great mimic. Our immediate hope in stemming this epidemic rests on inducing behavioral changes in the public. Issues of confidentiality, legal problems, and medical dilemmas are being hotly debated to determine the best way to curb the epidemic of AIDS.

The AIDS epidemic has overshadowed exciting discoveries in other areas of infectious disease epidemiology. Having been recognized as a common clinical syndrome in the northeast, Lyme disease is no longer considered a medical curiosity.[10] *E.coli* 0:157 has been identified as an important etiological agent for the hemolytic-uremic syndrome.[11] An association between parvovirus infection and fifth disease has been strengthened.[12] The role of cytomegalovirus in causing Kaposi's sarcoma has been studied. The role of hepatitis B in inducing liver cancer is firm enough to consider hepatitis B vaccine as the first vaccine against cancer. Also, the deadly interactions among the microorganisms causing delta hepatitis, heptatitis B, HIV, and tuberculosis have interested many researchers.

There is an explosion of information pertaining to health care delivery and the identification and management of infectious diseases. The State of Maryland Department of Health and Mental Hygiene, a resource available to all members of the health care delivery team, provides updated information in the realm of communicable and infectious diseases and may be reached by calling 301-225-6677.

IT HURTS TO BE NUMBER ONE.

Over 36 million Americans suffer from arthritis. That makes it the number one crippling disease in this country. It attacks in over one hundred different forms. Some forms disable. Some disfigure. All of them hurt. This year alone there will be over one million new cases.

The Arthritis Foundation is the only voluntary health organization fighting arthritis on every front.

If you need help, or want to help contact your local chapter or write: Arthritis Foundation, Department A, P.O. Box 19000, Atlanta, Georgia 30326.

IT'S TIME WE TOOK ARTHRITIS SERIOUSLY.

The Changing Scene in Health Care Delivery

Margaret H. D. Smith MD

On November 17, 1987 a symposium was held at the Johns Hopkins Children's Center to commemorate the founding 75 years earlier of the Harriet Lane Home (HLH), forerunner of the Children's Center. Among the talks was the following, which we present to underline the enormous differences in the infectious disease problems of today compared to those of fifty years ago and to point out how hospital buildings too can be recycled.

During 1945, when the Second World War was essentially over, the Hopkins Medical staff were trickling back from their wartime activities to resume their old jobs, and people like me, who had filled in for the regulars during their absence, were preparing to leave. One of my Harriet Lane colleagues asked me, "And what are you going to do with the rest of your life?" "Oh," I said, "I find infectious diseases so interesting that I am going to stay in this field." "What!" he said. "Meningococcal meningitis every winter; measles and mumps and whooping cough every spring; shigellosis and polio every summer; and then, when school starts up, diphtheria and scarlet fever in the fall; and that's the way it will be every single year for the rest of your life!" Today, one could be a very acceptable candidate for a chief resident in pediatrics in the United States without ever having seen a single case of any one of those diseases. And here I am in infectious diseases 40 years later.

Looking back, it is clear that a very large proportion of the cases in the Harriet Lane in the early years were due to or associated with infectious disease. Patients poured in from the Eastern Health District morning, noon, and night. The parents brought the children in on the North Wolfe Street side through the big entrance to the quadrangle and along to the door of the Harriet Lane. Just inside the door was the triage officer, usually a lowly intern, whose job it was to divide the patients into those who were direly ill or who had obvious contagious problems (diphtheria, meningitis, rash, acute otitis media, mastoiditis, pneumonia); all those went off toward the left to separate examining rooms whereas those who were returning by appointment or arriving with chronic problems went to the big waiting room on the right. It was basically a good system and excellent training for the house officer in instant evaluation of patients. Woe unto him or her who sent a patient with chickenpox out into the big waiting room on the right.

Before returning to the acute infectious problems on the left, I invite you to proceed with me to the right through the big waiting room to the Tuberculosis Clinic down one of the back wings.

The Harriet Lane Tuberculosis Clinic was a remarkable clinic. It was started in 1928 by Dr. Edwards Park, shortly after he became departmental chairman. Baltimore was an eminently appropriate city for such a clinic since it has always had a relatively high incidence of tuberculosis (up to the present time) and, therefore, a high death rate (Table 1). For the first four years Dr. Park worked in the Tuberculosis Clinic by himself with the help only of the social worker, Miss Georgie Walker, who worked in the clinic from the day it opened until the day it closed 22 years later in 1950. She

did have help in the intensive social work and in the follow-up from many others, among them Irene Ravitch. Miss Walker herself performed and read every single tuberculin test that was done throughout those years, using the same batch of concentrated old tuberculin. Dr. Park, soon realizing how very very little was known about the natural history and prognosis of childhood tuberculosis, enlisted the aid of Dr. Wade Hampton Frost, Professor of Epidemiology at the School of Hygiene. Together they set up records susceptible to statistical analysis. The clinic grew rapidly and more help was needed.

From 1932 on Dr. Miriam Brailey was in charge of the clinic. Born in Vermont in 1900, Dr. Brailey graduated from Mt. Holyoke, then from the Johns Hopkins Medical School in 1930. She received her DrPH in 1931, spent a year in pediatric training, and then headed the Tuberculosis Clinic until 1942, when she became director of the Bureau of Tuberculosis of the City of Baltimore and later director of the adult Tuberculosis Clinic of the Johns Hopkins Hospital. A tall, dynamic, devout Quaker, she made a strong impression on house officers (like myself) who worked with her. Whether we were assigned at our request or by chance, I do not remember. Some medical students also were assigned, mainly for x-ray reading, and Lydia Edwards recounts the fun she had whenever she slipped in the chest x-ray of a monkey with a chain around its neck!

The Tuberculosis Clinic admitted children under two years old who were either tuberculin-positive or likely to become so because of contact with a sputum-positive adult in the home. Out of the data accumulated on the 1,329 children in the study came the first systematic understanding of the natural history of primary infection with tuberculosis in human beings. Here were answers to questions such as: What is the likelihood of a young child dying of tuberculosis if he has a lesion on x-ray; and if he is going to die, when will it happen? What percentage of children with positive tuberculin tests actually will die (if not treated), and are there differences in different ethnic groups? How does primary tuberculosis evolve? What Wallgren later called the "timetable of tuberculosis" was first systematically studied and clarified in the HLH TB clinic.[1]

Dr. Lydia Edwards assumed the directorship briefly from 1942 to 1944, and was succeeded by Janet Hardy from 1944 to 1949 (Table 2).

A number of papers resulted from these years of intense clinical observation and public health work; Miriam Brailey and Janet Hardy analyzed and summed up their findings in two companion volumes, *Tuberculosis in White and Negro Children*, published in 1958.[2,3] Many others worked also in the Tuberculosis Clinic, including Dr. Edwin Kendig Jr. who has maintained a lifelong interest in the disease and published many articles on it, most recently his Jacobi Award address.[4] The clinic closed in 1950.

Return with me to the triage desk at the front door of the Harriet Lane Clinic on a busy afternoon and turn left to see what happened there. The majority of patients would be suffering from mundane things such as otitis media, pneumonia, and sore throats and would be treated as outpatients. Some few with severe pneumonia, empyema, mastoiditis, or osteomyelitis would be admitted to the HLH or possibly referred to Sinai Hospital (at that time just across Monument Street) or maybe to Baltimore City Hospitals. Patients with uncomplicated measles and chickenpox would be diagnosed and sent home.

But what about diphtheria, meningococcal meningitis, and complicated measles or chickenpox? Almost all had to be sent by special ambulance to Sydenham, the municipal communicable disease hospital. Not only were *patients* by the dozens shipped there, but also all Hopkins *students* were taught there for many years and all HLH *house officers* for a great many years worked there. It was an integral part of the Harriet Lane experience and, therefore, deserving of a very special look in conjunction with the history of the HLH.

Sydenham

Contagious disease hospitals began to develop in this country in the latter part of the nineteenth century as places to segregate patients with contagious diseases, but the demand for such a hospital in Baltimore really came from William Welch (seconded by Osler) just 100 years ago. Welch was appointed chairman of a commission to come up with a site for the hospital that, after years of delay, opened in 1909 on the grounds of Bay View (later Baltimore City Hospitals and now Francis Scott Key Medical Centre). Table 3 gives some indication of the infectious disease situation in Baltimore in 1920.

Table 1. Tuberculosis in Baltimore

Year	Cases	Deaths
1920	1,421	?
1930	1,532	812
1940	1,543	816
1945	1,925	773
1950	1,346	536
1970	493	91
1985	182	16

1928 - 1944
1329 Children admitted from 507 households
892 black from 326 households
437 white from 180 households
1950
Clinic closed

Sydenham immediately was filled to capacity and the Welch Commission had to resume its unpopular job of finding a location for a larger pest house. Said Harry Dowling, "The location of the new hospital was kept secret until it was completed. People who saw a building being constructed on the grounds of the reservoir at Montebello must have assumed it had something to do with the city's water system. Only when the building was almost completed was a sign put up that read *Sydenham Hospital.*"[5]

In 1924 the hospital opened and comprised a main building, a nurses home, and five auxiliary buildings. The main building included three stories and could accommodate up to 140 patients in a dire emergency, although the usual census was more like 50 (mostly in private rooms with private bath, some in larger wards). In 1930 most patients referred by the HLH and other clinics in the city and by private doctors were suffering from diphtheria and scarlet fever, but as confidence in the hospital increased, relatively larger numbers of patients were referred for admission (Table 4). It is noteworthy that smallpox disappeared in 1928 from Baltimore forever.

By 1931 Dr. Huntington Williams had become Commissioner of Health, and Sydenham was under his direct supervision. Thereafter, the number of admissions to Sydenham Hospital remained at a steady level (Table 5). Meanwhile Dr. Park had found the facilities at the HLH too meager for teaching and research in infectious diseases,[5] and with Williams, Park arranged for a new position at Sydenham, henceforth occupied by a member of Dr. Park's staff with responsibility for all teaching, patient care, and research. Francis Schwentker was Director from 1936 to 1938, and pediatric interns were regularly and continuously rotated from HLH, Duke, sometimes Vanderbilt, and medical interns from the University of Maryland, so that Sydenham became a bona fide university teaching service. The Director reported weekly to Dr. Park as well as to Dr. H. Williams. It also promptly became a research-oriented service dedicated to the trial of new anti-infective agents, at first sulfonamides, later streptomycin and penicillin.

Smallpox	34	(1928 Last case)	-	-

What an exciting time that was: I remember as a medical student in 1938 being shown a bright little black girl said to be the first patient ever to recover from pneumococcal meningitis, thanks to sulfa drugs.

Schwentker left in 1938, and Horace Hodes, his successor, maintained and increased the emphasis on excellent medical care, good teaching, and research. Hodes was director from 1938 to 1949 except for the three war years 1942 to 1945 when I replaced him as Medical Director while he was in the Service.

How competent and scientific could this hospital be way out there alone with the waterworks? Table 6, showing a partial list of bacteriologic procedures for 1940 gives the feeling that as far as bacterial infections were concerned, Sydenham was for its day a very up-to-date place. Diagnostic virology was essentially nonexistent at that time. The bacteriology lab was presided over by Helen Zepp (Zeppy), a real Tartar but with a soft heart, keen intelligence, and a great deal of patience for teaching house officers.

What kinds of patients were seen? Always patients with diphtheria and scarlet fever, but Table 7 shows how what might be called the disease-of-the-year varied enormously in the community, and that of

Note: figures supplied by H.F. Dowling[6]

varied enormously in the community, and that of course was reflected at Sydenham (Table 8). Some of us remember all too vividly the awful polio epidemic in the summer of 1944: terrible heat; no air-conditioning, not even a cross draft because the doors to the individual rooms were always kept strictly shut; the big old-fashioned respirators; patients crying and screaming with pain, especially the older ones; the Kenny hot-pack method of treatment; the drinking fountain flasks filled with normal saline instead of water because the staff members were constantly drenched in perspiration.

And then there was the diphtheria epidemic of 1945 with all the tracheotomies and the patients with mycocarditis who had to be kept flat on their backs for weeks on end; and the patients with ascending paralysis, which we could do nothing to stop. Busy we were, but bored never, and certainly the experience at Sydenham added many dimensions to the experience of the house officers and students from the HLH.

Into the Community

One dimension I always thought important was the opportunity to ride ambulance and see the patients in their own natural habitat, so to speak. As each new medical or nursing student or house officer came for a stint at Sydenham, one of the more senior people tried to go out with him or her for the first ambulance pick-up. I remember one early evening riding out with a student to a dreadful part of the city (now mercifully demolished) behind where the aquarium now is. It was such a bad area that even the police didn't dare go in, but the Sydenham ambulance was welcome, and with our white blouses on, emblazoned with Sydenham across the front, we were always safe. These slum houses were four or five stories high with two apartments on each floor and a very narrow winding staircase, so narrow that it was impossible to get a stretcher with patient down. The patient had to be lashed by the shoulders to the stretcher and lowered, moaning or screaming, down the center well.

On this particular day, we climbed to the top floor, and the student went into the back bedroom to talk to the mother while I waited out in the kitchen with the grandmother. "Hon, "she said to me, "you look tired." "Oh I am, "I said, I worked right through last night and never got to bed. "Hon,"she said, "You had dinner?" "No," I said, "but it will be waiting when I get back to the hospital." "Hon," she said, "When you're tired to the bone, there ain't nothing like food to keep you going. I know, and I gonna fix you a plate." Over my protests she took a dirty frying pan, fried up a mess of home fries, took a dirty plate off the table, cleaned it on her dirty apron and, put the home fries on top with a couple of fried eggs. I wolfed it all down gratefully and felt instantly better, just as she had prophesied. Here was I, from a very protected upper-middle-class home, and here was this woman, no doubt mother of thieves, murderers, and prostitutes, and very probably having herself engaged in each of those activities (depending on life's circumstances at the moment) mothering me very effectively at a time when I needed it. I have always felt that such experiences are invaluable for medical students (and for all of us) so that we become aquainted with at least a bit of the background of some of our patients.

Publications

Dozen of articles and papers resulted from the clinical experience and from the clinical studies carried out at Sydenham, often with house officers and sometimes medical students as co-authors: articles most often on antimicrobial therapy as it developed, but also on diphtheritic myocarditis. I remember one such article in 1944, "Combined Penicillin and Sulfonamide Therapy in Pneumococcic Meningitis." Tono Waring (Antonio J. Waring, Jr.) and I wrote it, and we dutifully took it to Dr. Park's office for him to pass judgment. In due

course, we were both summoned: he was sitting very tall behind his desk. After a long silence he said, "Dr. Smith and Dr. Waring (he was always very formal) I have read your paper. It is a perfectly terrible paper. I think it's the worst paper I ever read. It will be necessary for you to spend the entire day on Sunday out at our house reworking the paper. You will arrive promptly at 8 a.m." With that, we were dismissed. I was almost in tears, but Tono, who was already an habitué of the Park household, said "Oh, don't worry, he's only teasing."

At 8 a.m. on Sunday, we were there. First came bird watching out in the neighboring woods in the Green Spring Valley; then a delicious breakfast provided by Moo (Mrs. Edwards Park); then gardening under her cheery supervision followed by lunch with much conversation. Somewhere along the way we spent a few minutes on the paper, which Dr. Park had totally rewritten so that it was acceptable to the *JAMA*. For me that day was the start of a long and beautiful friendship that led to some lovely Sundays spent in the Green Spring Valley, trips to the Bethlehem Bach festival, and unforgettable holidays with the Parks in the Margaree Valley in Nova Scotia.

The history of Baltimore's Sydenham Hospital, to quote Harry Dowling again, illustrates the sequence of slow beginning, short flowering, and rapid decline of a typical contagious disease hospital in a typical American city. The story is also of interest because of the hospital's relationship to Johns Hopkins University. Sydenham, like all similar urban contagious disease hospitals, was put out of commission by improved sanitation; better housing; the development of immune sera, of parenteral fluid therapy, and especially vaccines; and dealt a final fatal blow by the very antimicrobials it helped introduce into medicine. By 1950 Sydenham was closed, and patients needing inpatient care for contagious diseases were sent back to Bay View (then Baltimore City Hospitals) as in the early years of the century.

The infectious disease situation in Baltimore has changed still further between 1950 and 1986, as shown in Table 9. The Montebello Sydenham Hospital building was recycled, to be a tuberculosis hospital, then a general chronic disease hospital. In its present incarnation, it has emerged as the Montebello Rehabilitation Hospital for patients following stroke and head injury, and once again residents in various specialties rotate there from university centers.

Current Outlook

What can be said about infectious diseases today and into the future? Today's infectious disease specialist is totally different from the Sydenham staff physicians. In the first place he or she is not needed so much because of personal experience with a particular disease. Laboratory tests, if properly used, permit recognition of most infectious diseases. With the disappearance of the earlier common childhood infectious diseases, individual cases occur due to extraordinary pathogens, often in immunocompromised individuals. One scampers then to the computer and Medline to see who has had experience with one or a few similar cases. Heavily endemic and epidemic diseases are not the current infectious disease specialist's big problem, although with the advent of AIDS that could change.

Over the history of infectious disease in the world, almost every century has seen striking and unexpected happenings in the picture: epidemics of influenza, like the 1918 pandemic, which could happen again; diseases introduced from somewhere else such as the plague, measles, smallpox, syphilis, and dengue. Most, perhaps all, infectious diseases that affect man started as zoonotic infections, that is, diseases of animals, before cozying up to humans, and this probably is true of AIDS. What will happen from here on with AIDS is at the moment quite unpredictable.

In closing, I would like to tender a distant wave of thanks to Harriet Lane, the lady herself, out of whose own personal sorrow was born the Harriet Lane Home. She may have imagined how much good her bequest would do for sick children and their families, although I sincerely doubt she conceived the magnitude of the scale on which it has happened. Never could she have imagined how many medical students, nurses, and doctors would be inspired and spurred on by what they learned here, to disperse to far away places, carrying their competence with them, there to start up the cycle of child care, teaching, and research with resulting satisfaction to themselves and their new environment. For those things and for the friendships that inevitably arose during those intense joint endeavors and that last a lifetime - Harriet Lane, thanks a million, now and always.

Religion and Medicine: An Ancient Relationship

Theodore E. Woodward MD

Dr. Woodward is Professor of Medicine Emeritus, University of Maryland School of Medicine. The following lightly edited talk was given at the Medicine and Religion Breakfast at Med Chi's 1988 Annual Meeting.

From the ancients came medical ethical codes, medical philosophies, and methods of treatment. There has been an evolution of religious belief and the philosophy and ethics of medicine in parallel with the art, science, and practice of our noble profession.

The civilizations of Mesopotamia and Egypt date back to the fourth century BC and were founded on mud and land enriched by floods. The people of Mesopotamia settled in the rich valley of the Euphrates and Tigris rivers. They were thought to be of Asian origin and, according to the writings, this was a land of plenty with food consisting of vegetables, barley, bread, cereals, milk, honey, and occasionally fish and meat. They were credited with having invented writing to help link the past with the present; they mined ores and engaged in metallurgy; they controlled rivers and founded their cities and political states on irrigated soils. Codes of law were written, and man was regarded as having a right to justice.

Babylon

King Hammurabi of Babylon was said to have lived about 2100 BC. Most of the learned men in his court were physicians and priests who were called on to serve the king's officials. The poor were treated without fee. The physician-priests were learned in reading, writing, knowledge of science, religion, and literature. Their medical treatments often were performed by ritual and magic. Divination was one of the techniques used, and their concepts often were based on astrology. Medicine was regarded as a sacred art, and its principles frequently were taught in the temple. The sick were treated with charms, drugs, and minor operations. Physicians made a point of not treating hopeless cases.

In this civilization, the liver was regarded as the seat of the soul and center of life. The technique of hepatoscopy, performed by divination, was a ritual performed before the statue of a god. Usually an animal was sacrificed and the liver of the animal was examined and compared with a clay model of the liver. Various changes, colors, and prominences of the fresh liver were then used to gauge diagnosis and prognosis for the patient.

Illnesses were treated with drugs, fumigation, medicated baths, and hot and cold water baths. At times, drugs were given in anal suppositories and even by blowing medications into the urethra

with a tube. Phlebotomy was often performed by cupping, a procedure dating back to old China. Popular drugs of the day were hellebore or colchicine, opium, and hemp.

Diseases thought to be prevalent during the Euphrates' epoch included rheumatism; tumors; heart trouble; abscesses; jaundice; respiratory ailments; disorders of the eyes, ears and skin; and venereal diseases.

Codified laws were formulated to preserve public health, and for the first time, the duties and responsibilities of physicians were recorded. Legal penalties were established if the physician's treatment caused injury or death, and the sentence was pronounced by the king in the presence of his advisors.

If an operation caused the loss of an eye, the physician might have his hand amputated; if a highborn person died as a result of treatment, the physician lost his life. Fees for service were paid by sheckles of silver, gold, or copper. Sometimes payment was in kind, for example, grain, sheep, salt, or even slave labor. Under King Hammurabi, one of the first medical ethical codes known to man was established.

During the reign of King Nebuchadnezzar (about 600 BC) the city of Babylon was rebuilt. The hanging gardens were said to be one of the seven wonders of the ancient world. But with the water required for daily use and irrigation came mosquitoes and with it malaria and other diseases. It is known that dysentery, typhoid fever, leprosy, and eye diseases prevailed at this time.

Egypt of the Pharoahs

Ancient Egypt began with the reign of King Menes, about 3000 BC. During the next four years, there were thirty separate dynasties, which lasted until an asp poisoned Cleopatra's breast. This was the land of Pharoahs (Keeper of the Royal House), and the king was regarded as a god. There were many gods and goddesses and the sun god, Re, was also known as Ra, Amen, or Amon. Men in such high places as Pharoahs did not really die; rather, their death was regarded as a momentary interruption of life. The embalmer's art was established primarily for kings and noblemen. During the embalming, the brain (regarded as not very important) was withdrawn from the dead by suction through the nasal passages. Most of the viscera were removed but the heart, now conceived as the seat of personality, was left in place.

The physician of the day was usually a man of culture and learning; royal physicians were often specialists of eye and tooth disorders, abdominal complaints and the internal fluids. There was no money exchanged for fees, but usually the wealthy were expected to present gifts. Often, because of their eminence, Egyptian physicians were called on to consult with noblemen in neighboring Persia.

The most famous of the ancient Egyptian physicians was Imhotep, who lived about 3150 BC. Imhotep was the physician to King Zoser; he was priest, scribe, astronomer and grand visier. During his term of office, the first pyramid (Sakkara) was built; it is thought to be the oldest stone structure in the world. Under Imhotep, the foundation of Egyptian art was laid which prevailed for centuries.

Although in Mesoptamia the liver was regarded as the seat of life, the Egyptians transferred that belief to the circulation and respiration as representative of vital functions.

The heart was regarded as the center of the blood-vascular system, and 22 to 24 vessels were known to be connected to all body parts.

To the Egyptian physician, the heart and the circulatory system simulated the Nile river and its system of canals used for irrigation. Even now in the late twentieth century, particularly during times of bereavement, the minister often consoles with the comforting words: "Let not your heart be troubled." Also, each year on February 14 the symbol of St. Valentine's Day, is the heart, not the liver or the brain.

Medical practice in ancient Egypt consisted of two schools: the *Empiric method*, which was a costly ritual, available only for the wealthy, and a *magical ritual*, which was available to everyone. Remedies consisted of a thousand or more prescriptions. The common belief was that putrefaction, decay, and corruption were all similar processes. Much significance was placed upon the destructive effect of the fecal content of the bowel. Hence, the Egyptian commonly used purgatives and enemas for treatment. The medical papyri were simply directions of treatment written in hieroglyphics, which have been translated in modern times.

Alexandria developed the first great clinical school where anatomic dissection was first practiced. Their concept was that the seat of disease was the organs and not the humors.

Aesculapius-Hippocrates Era

Early Greece was established by Aryans, who came from beyond the Danube. With bronze weapons, they overwhelmed the stone-age inhabitants. Links with Eastern culture were established bringing the philosophy of Lao-Tse and Confucious from China and the beliefs of Buddha and Isaiah from India and Judea, respectively. The various tribes and sects distributed throughout the various Grecian Islands were unified.

Much of the known information came from the

blind bard, Homer, in his writings of poems, including the *Iliad* and *Odyssey*. Homer lived about the tenth century BC. Before Homer, the liver was regarded as the site of life; with Homer, this concept was transferred to the heart. After Homer, the soul was said to be located in the brain.

The Greeks engaged in speculative thought and made broad generalizations from observed facts. Many believed that the principles of nature (earth, air, water and fire) were responsible for man's equanimity. Others based their beliefs on magical phenomena. The Greeks were great borrowers: from the Egyptians, they gleaned knowledge of mathematics and building with columns; from the Babylonians, they borrowed the principles of astronomy. The Greeks then formulated all the known concepts into a fundamental knowledge based on history and logic. They built their white marble temples on rising heights in order to see the rising and setting sun but also for safety from invasion by a hostile force.

The early Greeks placed their religious belief in gods, whom they venerated as almost human and who seemed to spend timeless, deathless lives in feasting, love-making, and often meddling in earthly affairs. The accepted geneology of the gods was Zeus-Apollo-Athena-Aesculapius and his daughters, Hygeia and Panacea. The temples for the gods were built in pastoral, healthy settings on scenic grounds where there were natural springs, bathing pools, theaters, stadia, gymnasium, and gardens. Illness was believed to be punishment caused by the gods. In classic Greece, pilgrims, rich or poor, went to the temples to seek a cure. Now we call them spas.

Two great systems of medical philosophy developed: *temple medicine*, based on religious suggestions and psychotherapy, and *empiric medicine*, based on rational thought, which was the major contribution of Hippocrates.

The Aesculapian cult believed in temple medicine. Here, miracles were performed. Often healing was by incubation, which consisted of contemplative dreams and temple sleep. The person seeking help studied the temple writings, worshipped votives, and was massaged. He slept at the foot of Aesculapius and dreamed about him, often with the help of a little opium. Aesculapius or his daughters (Hygeia and Panacea) frequently appeared in the patient's dreams. In a day or two, the cured patient departed but was expected to leave a little remembrance, anything affordable, such as gold, silver, ivory, songs, prayers, sheep, or payment of various kinds. With a little stretch of the imagination, it can be said that the basic percepts of the nineteenth century sanatorium movement can be traced to Aesculapius and the Greek and Roman civilizations. There was no wide acceptance of this type of medical cure until the establishment of tuberculosis sanatoria by Brehmer, in the Silesian mountains in 1854, and by Edward Trudeau, at Saranac, in 1882.

The psychotherapeutic temple medicine period was followed by itinerant, peripatetic physicians, who carried medical practice to the villages. They were experts in pronoia, or prognosis. They described onlookers' illnesses on the spot and used diet, herbs, and drugs in treatment.

Soon, two Empiric Schools developed, based on Rational Thought. One was the Cynidian school, which focused on *diagnosis*, and the Coan(Cos), based on *prognosis*, which was the concept of Hippocrates.

Hippocrates' beliefs were founded on *rational deduction*. Using past facts and present findings, he formulated the future of illness based on current symptoms and previous observed experiences.

Hippocrates was the first to treat patients, not diseases, a practice comparable to the modern biographical approach to patients' problems.

That one man, Hippocrates, is responsible for the formulation of this new attitude is unlikely. Yet there is no question that a man named Hippocrates lived and was a great and innovative physician. He is said to have been responsible for the sunburst of Greek medical intellect.

Hippocrates was born in a small village among the olive trees at Cephalos, on the Island of Cos, about 460 BC. This was about two thousand years after Imhotep. Hippocrates was regarded as an errant Asklepiad (a follower of Aesculapius). He dispelled the influence of Gods as a cause of illness and, for example, insisted that epilepsy, prevalent then, was not a sacred disease but had a natural cause. He believed in the four humors of the body: blood, phlegm, yellow bile, and dark bile. Illness was thought to be due to an imbalance of these four humors. To Hippocrates, a sick person was no longer a sinner, but rather a human being going through a phase of life history consisting of an illness.

Hippocrates often taught students in the shade under the branches of a plane tree in the center of the village of Cos, on the Island of Cos. He diagnosed and treated patients by the Empiric method. Past history was important to him as were the observed findings; prognosis was based on these findings. Disease, according to Hippocrates, was caused by a natural process and influenced by environment, climate, diet, and a person's way of life. Hence Hippocrates was a psychiatrist well before his time. He was also a surgeon who often performed delicate surgical procedures. From his writings, come such terms as chronic, exacerbation, relapse, resolution, crisis, paroxysm, and convalescence. His aphorisms (concise statements of basic principles) are now published in the *Corpus Hippocraticum*. In the 72 volumes attributed to him are excellently described case histories: striking, well-recorded examples of gout, epilepsy, tetanus, and even hysteria.

Greek philosophers and physicians established a foundation of thought that has survived the ages. Socrates taught man to think; Plato accepted that all

knowledge came from within and that the brain was man's most notable tool; his pupil, Aristotle, restored medicine to the kingdom of biology and contended that everything eminated from the outside and was absorbed through the senses and perception. Galen, who lived in the second century AD placed medicine on a firmer scientific base.

In summarizing this account of how religion and medicine were so intimately associated by ancient physicians, we should not lose track of the fact that similar beliefs persist two thousand years later. One of my predecessors to the Chair of Medicine, Dr. Samuel Claggett Chew, was once asked by a medical student if he ever invoked help from the Divine Being in his diagnostic practice. Chew responded, "Yes, but not until I have exhausted all of the talents given me by the Divine Being. "

Let us finish by commenting that the Hippocratic Oath is a great code based on the Golden Rule that to be a good physician, one must first be a good and kind man or woman. In keeping with the first principle of medical ethics proposed by Hippocrates, 400 BC:

> A physician should be an upright man, instructed in the art of healing-modest, sober, patient, prompt to do his whole duty without anxiety; pious without going so far as superstition, conducting himself with propriety in his profession and in all of the actions of his life.
>
> Conduct - Obligation - Character

There has been an evolution of religious belief and the philosophy and ethics of medicine in parallel with the art, science, and practice of our nobel profession. Not one, but many civilizations, have contributed to the development of this knowledge. Each civilization borrowed from the other, tested an accepted theory or method of practice, and altered it in a way to better perfect the means of diagnosis, treatment, and prevention. From Hammurabi and Imhotep there were two thousand years until Hippocrates, and from Hippocrates to Pasteur, Koch, and Fleming, there were another two thousand years.

Everyday Applications

Perhaps one of the greatest needs of any human is to avoid loneliness and his preoccupation with time, more time, and what to do with it. A failure in communication between humans is a failing which has not been satisfied. Every man, woman, and child needs the recognition that he or she is a person and the assurance that his or her mind is in communication with the people and the world. It is here the clergy and the physician of medicine have a common bond. Often, their mission can be accomplished with the troubled person, not only through words of comfort but also often by simply sitting in silence. This was vividly demonstrated by the illustration of a relationship between patient and physician.

> Never will I forget how you stood by my bed, not on rounds, but voluntarily. You patiently reached into your heart and selected words not to mislead, but to enlighten. My problem and my pain were also yours. Together, in that room, there was the feeling that we looked up to God and were going to accept his judgment. Here, man and medicine and religion were in harmony (Wolfe, A. Man, medicine and the ministry. Bull NY Acad Med 1961; Aug.

Medicine's strongest affinity has always been with the clergy since priestly medicine was first practiced well before the coming of Christ. In colonial America, the religious leader often was also the medical practitioner. The Reverend Cotton Mather was in the forefront of convincing the public that Jennerian smallpox vaccination was the appropriate way to prevent smallpox. There is no question that religion needs medicine and medicine needs religion. The National Academy of Religion and Mental Health was organized in 1954 to stress the role that clergymen of any denomination can play in helping the emotionally disturbed.

In the intimate contact with the patient's fears, anxieties, and forebodings, the physician's outlook and approach are similar to those of the minister or priest. So often patients struggling with mental and physical maladjustments open the recesses of their minds only to the physician. Along these lines lie the most important foundations of success for the physician: the achievement and restoration of health and proper function to those sick in body and mind. It is difficult to estimate at what point medicine ends and the application of faith begins; more likely the two are never seprate. It is along these avenues that the properly oriented physician will derive the greatest happiness from his or her medical work. Francis Peabody understood this premise so well in his remarkable paper, The Care of the Patient.

The Christmas story has been told many times. The Wise Men traveled by camel or donkey for many miles at the pace of two and a half miles per hour. They brought gold, frankincense, and myrrh to the Christ child to show their respect and honor. Gold is traditionally symbolic of the kinship of Christ; frankincense signifies the priesthood of Christ; myrrh signifies the healing power of Christ. In biblical days, this healing power created the concept of Christ as a doctor; hence the term Christus Medicus. When this idea waned, healing power was supposed to be transferred to the saints.

The recognition and acceptance by the minitry and the medical profession of different but similar approaches to daily problems can only help enhance the ability of members of both professions to work together toward a common goal. In their ministry to the sick, the clergy try to give a patient a sense of purpose and meaning to his or her life and to living in

general. The properly oriented physician uses this same approach.

There is an amusing anecdote regarding our common goal to avoid sin. The anecdote is based on President Coolidge's well-known characteristic of being a man of few words. President Coolidge met an old acquaintance one Sunday morning after church service. After an exchange of greetings, the man asked the president what had been the topic of the minister's sermon that morning. The president replied that the minister had spoken for an hour on the subject of sin. "Well, what did he say in all that time about sin?" the man asked the president. Mr. Coolidge replied, "He was against it."

In the broad sense, the complete separation of medicine and the ministry is impossible since they relate to the inseparable physical, mental, and moral condition of man.

There is a final common goal toward which both the ministry and medicine should devote all their energy: to help people use more effectively those inner forces that enable them to survive and to function at an optimal level.

The basic human qualities of the physician and the clergyman can always be employed not only to discover the mystery of man but also to seek to enlighten him. As physicians we may fail in our obligation to man if we allot to the minister, priest, or rabbi only the task of conducting a suitable burial ceremony.

In our relationship to patients, should the person always be told that he has cancer, that he has multiple sclerosis or any other degenerative disease, and the inevitable course the illness will take? It is important, ethically, medically, and religiously speaking, to deal truthfully. It is also important to discover a way of transmitting the truth without risking the possibility of unduly injuring the individual emotionally, spiritually, or even physically in the process.

In life, as in proximity to death, closer cooperation between medicine and the ministry is desirable. They come together usually at the time of approaching death, when time is a limiting factor to effective action or understanding. In this moment of crisis and in the face of death we deal with the patient's hope for life and his or her rejection of death. At this point the patient has a distinct right for guidance from either the ministry or medicine. Only the patient can decide this issue; medicine and the ministry can only provide guidance and mutual understanding.

MGMA Founded 1926 MEDICAL GROUP MANAGEMENT ASSOCIATION

Dear Doctor:

Does your practice manager:

- know how to maximize your practice income?
- understand the recent changes in the Medicare program?
- have good audit control procedures in place?
- supervise the front and back office staff effectively?
- evaluate patient satisfaction and marketing efforts periodically?

If you are not certain, recommend that your manager join MARYLAND MEDICAL GROUP MANAGEMENT ASSOCIATION — "The Organization for the Medical Practice Professional."

For More Information Write:
P.O. Box 5223
Baltimore, MD 21224

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Board of Physician Quality Assurance Actions

In the Matter of
Juan M. Chavez MD
Before the
Maryland Board of
Physician Quality Assurance

Background

On November 23, 1988, the Board of Physician Quality Assurance (the Board) charged Juan Chavez MD (the Respondent) with committing prohibited acts under the Medical Practice Act of the Health Occupations Article ("HO") *Annotated Code of Maryland*, 1988, 14-504(a)(1) and (a)(3). Specifically,

> (a) Subject to the hearing provisions of 14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:
> (1) Fraudently or deceptively obtains or attempts to obtain a license for the applicant of licensee or for another;
> (3) Is guilty of immoral or unprofessional conduct in the practice of medicine.

Respondent also was charged under 14-504(6) of the Maryland Medical Practice, Title 14, Health Occupations Article, *Annotated Code of Maryland*, 1987, which permits the Board to impose sanctions on a licensee who:

> Is convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside.

A hearing on the charges was conducted on December 23, 1988. At the hearing, it was agreed by counsel that the allegations contained in the charging document were accurate and not subject to dispute. Counsel for the Respondent agreed to the adoption of the allegations contained in the charging document as Findings of Fact, and therefore the only arguments presented at the hearing were directed toward the recommended disposition in this case.

No witnesses testified under oath although Respondent addressed the Hearing Officer. The State and counsel for the Respondent argued the issue of disposition and sanction.

On December 28, 1988 the Hearing Officer submitted a proposed decision to the Respondent and the State that contained Proposed Findings of Fact, Proposed Conclusions of Law and Recommendation. Respondent filed exceptions on January 5, 1989. The State filed no exceptions. On January 25, 1989 a quorum of the Board heard argument from the State and the Respondent. The Board had previously reviewed the transcript, the exhibits, and Respondent's exceptions. After considering the record and the arguments as presented, the Board finds as follows:

Findings of Fact

The Board finds the following facts by clear and convincing evidence:

1. At all times relevant to these charges, the Respondent was and is licensed to practice medicine in Maryland.

2. On March 4, 1987, Respondent entered a plea of *nolo contendere* to the crime of Sexual Offense in the Fourth Degree, in violation of Article 27, Section 464C, *Annotated Code of Maryland*, in the District Court of Maryland. On May 22, 1987 the Honorable John Themelis granted Respondent probation before judgment with thirty-six (36) months supervised probation, a psychiatric evaluation, a $100 fine, and payment of court costs.

3. The facts of the case mentioned in paragraph two (2) above are set forth as follows:

> On October 30, 1986, a fourteen (14) year old girl (the victim) and her friend came to Respondent's office at 2613 Eastern Ave., Baltimore, MD seeking birth control pills. After Respondent dispensed the birth control pills, he placed his hands on the victim's buttocks, grabbed her buttocks, and moved his hands in the direction of her vaginal area. Respondent kissed and licked the victim's neck stating:" I love you, I'll give you $20 if you come down next week by yourself, so I can lick you. Don't tell anybody about this."

4. Respondent's actions described in paragraph three (3) above constitute immoral conduct and occurred in the practice of medicine.

5. On June 1, 1988, Respondent pled guilty to Medicaid Fraud in violation of Article 27, Section 230C, Annotated Code of Maryland, in Criminal Information, 28815204, *State of Maryland v. Juan Chavez MD*. The Honorable Edward J. Angeletti sentenced the Respondent to one (1) year suspended, five (5) years supervised probation, $5,000 fine, payment of the court costs ($115) and $18,000 restitution to the Maryland Medical Assistance Program, Department of Health and Mental Hygiene, to be paid in installments of $300 per month starting June 1, 1988.

6. Medicaid Fraud in which the value of the money, services, or goods involved is $500 or more is a felony.

7. The Board sent a renewal application for Respondent on or about July 1, 1988.

8. Respondent applied for renewal of his license to practice medicine on or about September 1, 1988. In the renewal application, Respondent answered No to question number four (4) which is set forth as follows:

> Since your last registration, have you had any felony convictions?

9. On the renewal application, Respondent signed his name to the following statement:

> I affirm that the information I have given in this application is true and correct to the best of my knowledge and belief.

Conclusions of Law

Based on the clear and convincing evidence presented and the stipulated findings of fact *supra*, the Board concludes that Respondent committed the following prohibited acts:

Fraudently or deceptively obtains or attempts to obtain a license for the applicant or licensee or another; HO 14-504(a)(1);

Guilty of immoral ... conduct in the practice of medicine; HO 14-504(a)(3); and

Is convicted of or pled guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside; HO 14-504(6), Annotated Code of Maryland 1986.

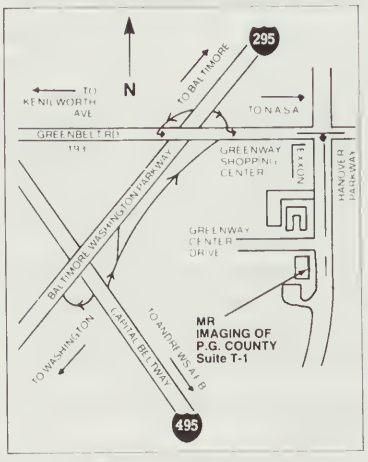
Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 8th day of February 1989, by the unanimous vote of the Board considering this case

ORDERED that Respondent's license to practice medicine in the State of Maryland be REVOKED; and be it further

ORDERED that Respondent IMMEDIATELY turn over to the individual serving this Order his original and current license; and be it further

ORDERED that this become a Final Order.



ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, Findings of Fact, Conclusions of Law, and Order will be published in the Maryland Medical Journal. ■

New AMA Book Offers Help on Starting and Managing a Successful Practice

Physicians who plan to start private practices or those who wish to review the fundamentals of practice management will benefit from the newly revised and expanded edition of *The Business Side of Medical Practice.*

Available from the American Medical Association, the book is designed to provide information needed to successfully start and manage a medical practice. Topics new to this edition are computers in the medical office and up-to-date information on the pros and cons of the various legal forms of organizing a practice.

Many chapters in the book focus on deciding how to practice, selecting the place to practice, setting up an office, clearing legal hurdles and securing professional assistance, and on the kinds of insurance a physician should carry.

Major helpful tips and guidelines will be found on efficiency and office operations, running the business side of practice, billing and collections, personnel management, and personal financial planning.

Throughout the book are various forms, charts, and checklists that may be reproduced and used by office staff.

The Business Side of Medical Practice is available for $30 (20 percent discount for AMA members) from the American Medical Association, Book and Pamphlet Fulfillment, PO Box 10946, Chicago, IL 60610-0946 or call 1-800-826-6895 with VISA or Mastercard to order.

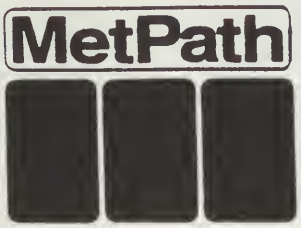
Diabetes Education Program Wins Recognition Award

The American Diabetes Association has presented its coveted Recognition Award to the Outpatient Diabetes Education Program of Suburban Hospital, Bethesda, MD. It is the first facility in Maryland to receive this award.

Of the 110 program plans in the United States submitted to the American Diabetes Association for recognition, only 57 programs had been approved by March 1, 1989.

The Outpatient Diabetes Education Program at Suburban Hospital is available to all diabetic patients and their spouses. It is also available to Suburban Hospital inpatients if their physical condition permits attendance and their personal physicians request it.

Physicians may receive further information about the program by calling 301-530-3056. Joyce Hayman RN, PhD, CDE is Program Coordinator, and De Witt E. De Lawter MD is Medical Director. ■



Safety-Belt-Use Law

The article on the Safety-Belt-Law in the April 1989 issue of the *Maryland Medical Journal* does not cover a breast condition that is ever increasing: breast reconstruction using implants. In accidents, these implants may be subjected to undue compression by a properly positioned seat belt.

The patient should be given an exemption for the use of the shoulder strap portion of the seat belt. The patient also should be made aware of the subsequent possible increased chance of injury as a result of not using the shoulder strap.

The physician would do well to have a properly drawn form stating the above exemption, the reasons for the exemption, and a witnessed patient's signature on the form. This form should be a permanent part of the patient's office record.

ELMER HOFFMAN MD
Chief of Surgery
Administrative Chief, OR/PACU
Baltimore County General Hospital ■

a **CORNING** Clinical Laboratory

METPATH IS YOUR COMPLETE LABORATORY

Our Regional Rockville Laboratory offers comprehensive service. MetPath has 4 STAT labs, 30 Patient Service Centers, and House Call Service in the Washington/Baltimore area.

QUALITY

Under the direction of a full time QA Manager and our Technical Director, MetPath's Quality Assurance Program is unsurpassed. Control samples account for up to 10% of our work load. MetPath subscribes to several outside proficiency programs. We are happy to shares results upon request.

SERVICE

MetPath's mission is to meet your requirements on time every time—with customized requisitions, flexible pick-up schedules, crisp report formats and responsive, courteous client service.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Continuously Throughout the Year

University of Maryland Dean's Conferences - Held monthly, these conferences are designed for the Family/General practitioner and the internist. Each conference highlights a different clinical department, placing emphasis on the practical methods currently being used and researched at the University of Maryland. **Dates: September 28, October 26, November 30, and December 13, 1989; and January 25, February 22, March 22, and April 26, 1990.**

Visiting Professor Program - Directory of speakers and topics available for area hospitals and other health care organizations. No administrative fee. Info: 301-328-3956.

Visiting Practitioner Preceptorships - Opportunity for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Hour-for-hour Cat I credits available. Direct **all** inquiries to CME 301-328-3956.

Departmental Rounds and Conferences - Weekly, hands-on and lecture presentation hosted by the University's clinical departments. Hour-for-hour AMA Cat I credits available. Brochure available.

Advanced Trauma Life Support Provider/Instructor Programs sponsored by University of Maryland/MIEMSS. Info: M. Nelson 301-328-2919.

Jul 13-14 - Provider
Aug 17-18 - Provider
Sep 13-15 - Instructor
Oct 19-20 - Provider
Nov 16-17 - Provider
Dec 14-15 - Provider ■

PHYSICIANS
Full-time & Part-time

In moderate depression and anxiety

- 74% of patients experienced improved sleep after the first *h.s.* dose[1]
- First-week improvement in somatic symptoms[1]
- 50% greater improvement with Limbitrol in the first week than with amitriptyline alone[2]

Protect Your Prescribing Decision: Specify "Do not substitute."

Limbitrol®

Each tablet contains 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt) Ⓒ IV

Limbitrol® DS

Each tablet contains 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt) Ⓒ IV

References: 1. Data on file, Hoffmann-La Roche Inc., Nutley, NJ. 2. Feighner JP, *et al: Psychopharmacology 61:*217-225, Mar 22, 1979.

Limbitrol®Ⓒ IV
Tranquilizer—Antidepressant
Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants; concomitant use with MAOIs or within 14 days of monoamine oxidase inhibitors (then initiate cautiously, gradually increasing dosage until optimal response is achieved); during acute recovery phase following myocardial infarction.

Warnings: Use with caution in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur when used with anticholinergics. Closely supervise cardiovascular patients. Arrhythmias, sinus tachycardia, prolongation of conduction time, myocardial infarction and stroke reported with tricyclic antidepressants, especially in high doses. Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (*e.g.,* operating machinery, driving).

***Usage in Pregnancy:* Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations. Consider possibility of pregnancy when instituting therapy.**

Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: Use cautiously in patients with a history of seizures, in hyperthyroid patients, those on thyroid medication, patients with impaired renal or hepatic function. Because of suicidal ideation in depressed patients, do not permit easy access to large quantities of drug. Periodic liver function tests and blood counts recommended during prolonged treatment. Amitriptyline may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady-state concentrations of the tricyclic drugs. Use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Should not be taken during the nursing period or by children under 12. In elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: Most frequent: drowsiness, dry mouth, constipation, blurred vision, dizziness, bloating. Less frequent: vivid dreams, impotence, tremor, confusion, nasal congestion. Rare: granulocytopenia, jaundice, hepatic dysfunction. Others: many symptoms associated with depression including anorexia, fatigue, weakness, restlessness, lethargy.

Adverse reactions not reported with Limbitrol but reported with one or both components or closely related drugs: *Cardiovascular:* Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke. *Psychiatric:* Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania, increased or decreased libido. *Neurologic:* Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns. *Anticholinergic:* Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract. *Allergic:* Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus. *Hematologic:* Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia. *Gastrointestinal:* Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue. *Endocrine:* Testicular swelling, gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion. *Other:* Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. Withdrawal symptoms also reported with abrupt amitriptyline discontinuation. Therefore, after extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

Overdosage: Immediately hospitalize patient. Treat symptomatically and supportively. I.V. administration of 1 to 3 mg physostigmine salicylate may reverse symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

How Supplied: *Double strength (DS) Tablets,* white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and *Tablets,* blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 50.

Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.

Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.

Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

A Choice.

Just what the doctors ordered.

No physician wants to be sued for malpractice. But it happens. And if it happened to you, wouldn't you prefer to be insured with the company that puts your professional reputation first?

We will not compromise your professional integrity in the name of a hasty settlement. When you choose Princeton, you choose a company that vigorously defends its policyholders against meritless lawsuits. In 1988, 93% of the court cases we managed were resolved in favor of the insured, and now this expertise is available to physicians in Maryland.

Contact one of the independent insurance agents that represent Princeton for more information about our claims management and our coverage options.

The choice is yours.

Medical and Chirurgical Faculty of Maryland

Cover Story

Med Chi's President 100 Years Ago
John Morris MD (1824-1903)

In 1888-1889 Dr. John Morris presided over the Medical and Chirurgical Faculty. An outstandingly active physician, Dr. Morris set a high standard of involvement and dedication for his fellow members during his term. His annual address at the April meeting was on a topic of no small concern at the time, "Crime: Its Physiology and Pathogenesis - How Far Can Medical Men Aid in Its Prevention?" Dr. Morris argued that while original research was needed to help improve society, previous work should not be overlooked. He concluded by paraphrasing a quote from Chaucer: "Out of the old books comes all the new learning; out of the old fields comes all the new corn."

The 1889 annual meeting featured a stellar array of major figures in Maryland medicine who either led discussions or presented papers. Dr. William Osler presented "License to Practice"; Dr. Ralph Winslow, Chair of the Section on Surgery at the University of Maryland, also delivered a paper, "Surgery of the Central Nervous System and of the Spinal Cord"; and Professor William H. Welch, then Chair of Med Chi's Committee on Anatomy, Physiology, and Pathology, read "Hydrophobia, Viewed in the Light of Pasteur's Recent Work."

That year the Faculty faced the continual challenge of trying to increase membership. A special Membership Committee, formed by the Executive Council and chaired by Dr. Thomas Ashby, found that the Faculty membership was made up almost exclusively of Baltimore City residents. This situation had developed due to an "excessive and burdensome" membership fee of $10 per year, which county physicians viewed as too high for a group that "meets only once a year."

Dr. Ashby and his committee first recommended that the membership fees be lowered to $5 for Baltimore residents and $2 for county members. Many members viewed this as reasonable, particularly since the American Medical Association was charging only $5 for membership.

The Committee's second recommendation was to hold a semiannual meeting on the fourth Tuesday in October in "some one of the county seats." After lenghty discussion the recommendation was accepted, and the Faculty's first semiannual meeting was held that same year.

Other problems the Faculty faced included providing heat for the Library Rooms and resolving ethical questions related to physicians' advertising. Several doctors found it "inconvenient" (substitute "too cold") to use the library during the winter months. As to the advertising: it was thought that advertising by members of the Medical and Chirurgical Faculty "placed the Faculty in a bad light." This concern was referred to the Ethics Committee for a final decision. Unfortunately, the records for the Ethics Committee for the 1880s have been lost, and one can only speculate on the outcome of the Committee's review of the problem.

It seems the more things change, the more they stay the same.

Waiting until January to review your malpractice policy could cost you thousands of dollars

Specialty	Medical Mutual	Princeton	Savings	
OB-GYN	$78,292	$37,628	$40,664	52%
Neurosurgery	45,909	25,498	20,411	44%
Orthopedics, Cardiac, Thoracic and Vascular Surgery	35,870	19,891	15,979	45%
General & Abdominal Surgery	25,834	14,284	11,550	45%
Family Practice and Internal Medicine with Minor Surgery	9,998	5,437	4,561	46%
Internal Medicine and Pediatrics with no Surgery and Ophthalmology with Minor Surgery	6,030	3,221	2,809	47%

If you are currently insured by Medical Mutual and your policy renews after a full year in January, 1990, you will advance from your current claims made year to the next. Each advance in claims made year up to the eighth year brings with it significant premium increases.

Due to the method Princeton Insurance Company uses to determine its claims made year, you may be able to continue your current claims made level for an additional year by switching to Princeton before this September. The long-term savings are as much as 35% annually with a first-year savings of over 50%. Prior Acts coverage is provided at no charge. *No tail is needed to make the switch.*

Set out above are sample rates for various specialties. The table shows the Medical Mutual rate for this January's renewal for a physician entering the third claims made year and Princeton's rate for a switch before September to take advantage of one more year at the current claims made level. The rates shown are for Baltimore physicians. Comparable savings are available all over the State. If you have already paid for a full year with Medical Mutual, you will be entitled to a refund for early cancellation. Return the form below or call us for an evaluation of your policy.

AUGUST 1989
Selected Communicable Diseases in Maryland in 1988
(Continued from July 1989)

HEPATITIS A (308)
6.7/100,000 (U.S. - 10.9/100,000)

Hepatitis A has been steadily increasing since 1984 (Figure 2), when the incidence rate was 1.4/100,000. Ninety-four (30.5%) cases in 1988 were part of 12 outbreaks that occurred in Montgomery (4), Prince George's (4), Caroline (1), Charles (1) and Howard (1) counties, and Baltimore City (1). Montgomery County, with 36.0% of the cases, had the highest incidence (15.7/100,000).

The male to female ratio was 1.5 to 1. Seventy percent (70.5%) of the cases were white, 6.2% black, 2.3% Asian, less than 1% were Hispanic, and the race of 59 (19.4%) individuals was unknown. More than half (52.6%) were young adults, equally represented in the age groups 20 to 29 and 30 to 39 years. The diagnosis in 90.3% of the patients was confirmed with a positive hepatitis A IgM test result.

A known or suspected source of infection was reported for 135 (43.8%) cases: 41 (30.4%) had contact with a confirmed or suspected hepatitis A case, 36 (26.7%) had consumed potentially contaminated food, 17 (13.0%) had been exposed abroad or were refugees from foreign countries; illegal drug use was noted as a possible source for 17 patients (13.0%) (compared to 12.2% in 1987). The exact drug(s) and route of administration were not established. Outbreaks of hepatitis A involving drug addicts were not reported.

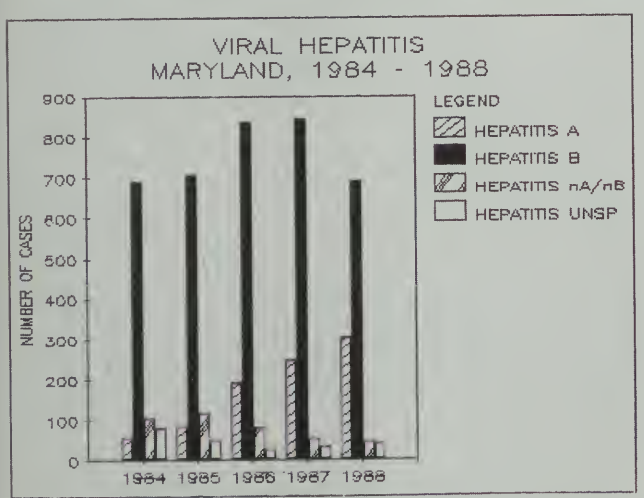

Figure 2

HEPATITIS B (691)
15.1/100,000 (U.S. - 9.2/100,000)

The incidence rate of acute hepatitis B decreased in 1988 (Figure 2). However, a few counties showed a rate increase: Harford County had an almost 150% increase, Cecil County doubled its cases, and Frederick County had a 33.3% increase. A declining rate was observed in Baltimore City and Wicomico, Howard, and Prince George's counties.

The male to female ratio was 1.8 to 1.0. The highest incidence rate (55.0/100,000) was seen in men and women between 25 and 29 years of age (28.2% of the cases). Thirty two precent of patients were black. In Baltimore City 56.0% were black, the male to female ratio was 2.2 to 1; almost half (47.6%) were 20 to 29 years old and an additional 27.2% were in their thirties.

Information on the probable source of infection (during the 6 months prior to onset of illness) was available on 298 (43.1%) of the reported cases. Sources were as follows:

122 (40.9%) known or suspected IV drug use,
70 (23.5%) contacts of cases of hepatitis B,
17 (5.7%) homosexual or bisexual males,
16 (5.4%) employed in a medical or dental field,
15 (5.0%) heterosexual contact,
13 (4.4%) other percutaneous exposures,
10 (3.4%) blood transfusions,
11 (3.7%) hospitalization, including 5 (1.7%) with surgery,
7 (2.3%) kidney dialysis,
7 (2.3%) refugees from Asia and Africa,
6 (2.0%) attended by dentist or oral surgeon, and
4 (1.3%) other unspecified exposures.

HEPATITIS NA/NB (49)
1.1/100,000 (U.S. - 1.0/100,000)

The rate of hepatitis nA/nB has been declining since 1985 when the incidence rate was 2.7/100,000 (Figure 2). For most of the cases, an attempt was made to confirm the diagnosis by excluding acute hepatitis A and B through obtaining negative hepatitis A IgM and hepatitis B core IgM test results.

Harford County reported 6 cases and showed the highest incidence rate (3.6/100,000) in the state. Almost half of the patients (47.0%) were between 20 and 39 years of age, followed by 39.0% that were 50 and over.

Suspected source of infection during the 6 months prior to the onset of illness was reported for 22 (44.9%) cases: 12 had received blood or blood products by transfusion, 4 admitted illegal drug use, 2 noted visits to dental offices, 1 had surgery, 2 had other percutaneous exposures, and 1 was on kidney dialysis.

LEGIONELLOSIS (30)
0.7/100,000 (U.S. - 0.4/100,000)

Half of the legionellosis cases occurred in the winter months. Cecil County had the highest incidence (7.1/100,000), followed by Washington County (4.3/100,000). The median age of the affected individuals was 64.5 years (range 13 to 94 years). The male to female ratio was 1.1:1.

Six of the patients were reported to have other illnesses (cancer or diabetes), organ transplantation, or immunosuppression. Three persons reportedly acquired the illness during admission to health care facilities.

The diagnosis of 87% of the cases was confirmed through isolation of *Legionellae* (from lung tissue, bronchial or nasopharyngeal washings, pleural fluid, or sputum), serological tests (IFA titer rise to 1:128 or convalescent titer 1:256), or DFA stain with not less than 6 fluorescent bacilli per slide.

Seven deaths were reported, 16 patients recovered, and the outcome for 7 cases is unknown.

LYME DISEASE (55)
1.2/100,000 (U.S. - N.A.)

Reporting of Lyme disease, even though not required by law, increased 140% over 1987, when 23 cases were reported. Anne Arundel County reported 11 cases, followed by Montgomery with 9 and Baltimore County with 8. Charles and Talbot counties reported 5 cases each; Baltimore City and Prince George's County, 3 each, and Calvert, Queen Anne's and Wicomico counties, 2 each. One case was reported from Cecil, Frederick, Harford, Howard, and Kent counties.

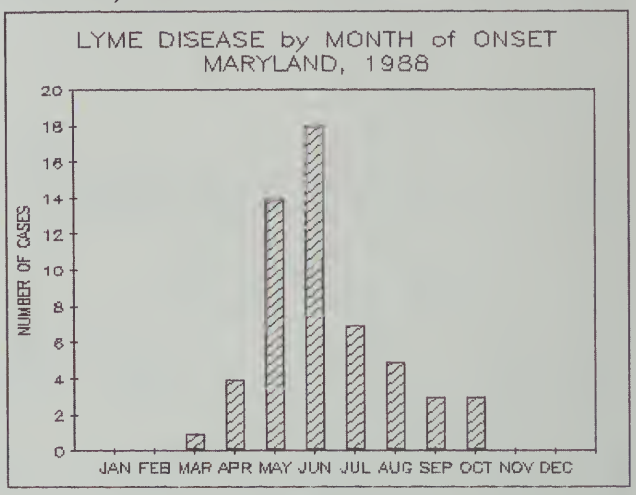

Figure 3

The male to female ratio was 1:1. The median age of cases was 24 years (range 1 to 76 years). Nineteen cases (34.5%) were children 10 years old or younger; ten (18.2%) were between 21-30 years old. Fifty-three (96.4%) were white. Onset of illness by month is shown in Figure 3.

Definite tick bites were reported in 29 (52.7%) cases and possible tick bites or exposures in 13 (23. 6%). Five of the definite tick bites were reported to have occurred outside of Maryland, but in general, the exposures were reported to have been within the jurisdiction of the residence.

Fifty (90.9%) patients were reported with the characteristic rash (erythema migrans), and six (11.0%) had neurologic symptoms [Bell's palsy (4) and meningitis (2)]. Cardiac signs (palpitations, tachicardia, or EKG changes) were reported in 3 (5.5%). Arthritis in one or more joints was reported in 10 (19.2%) cases. Affected joints included ankle (5), knee (4), and less frequently hip, shoulder, wrist, elbow, and finger joints.

Nine patients (16.4%) were hospitalized. Forty-five (91.8%) of the 49 cases for which treatment information was available were treated with tetracycline or penicillin. Treatment for Lyme disease is most effective early when the rash occurs; prompt treatment should reduce the likelihood of late symptoms.

Lyme disease has been included in the ammended list of reportable diseases in the Code

of Maryland Regulations submitted for approval.

MALARIA (27)
0.6/100,000 (U.S. - 0.4/100,000)

With the exception of 2 malaria cases with unreported country of exposure, the rest (92.6%) acquired malaria in Africa (22), India (2) and the South Pacific (1). Patients with diagnosed *Plasmodium falciparum* (18) were exposed in Africa, those with P. vivax (2) in Ethiopia and in the South Pacific, and the exposure history of 1 person with *P. ovale* was not available. The *Plasmodium* species for 4 patients was not reported. Twelve patients had had malaria prophylaxis, 8 did not, and for 7 this information was not available.

MEASLES (19)
0.4/100,000 (U.S. - 1.2/100,000)

Measles increased to 19 cases in 1988 compared to 10 cases in 1987 (Figure 4). Seven patients were part of 2 outbreaks, one at a col-

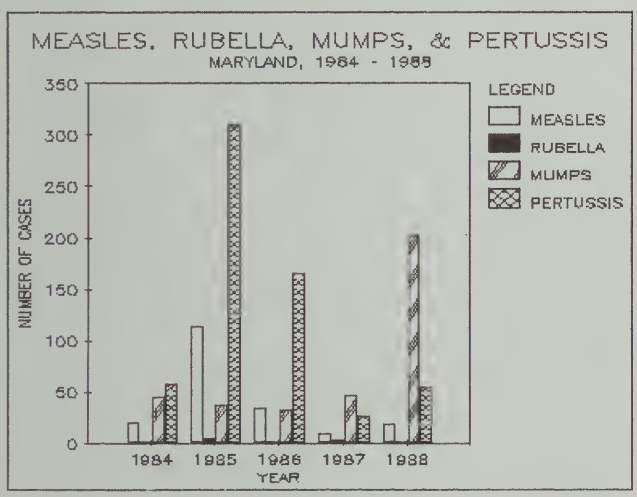

Figure 4

lege and one at an elementary school. Almost half (47.4%) of the cases were 10 to 19 years old. Six cases were international imports. Sixteen (84.2%) cases were non-preventable and 3 (15.8%) were preventable.

MENINGOCOCCAL INFECTIONS (57)
1.2/100,000 (U.S. - 1.1/100,000)

The incidence of meningococcal infections has been steady in the past 10 years with the number of cases ranging between 44 and 66 (median, 55 cases) (Figure 5).

During 1988, 12 of the 24 county health departments had at least 1 case. Prince George's County was leading with 15 cases and the highest incidence rate (2.2/100,000) in the State.

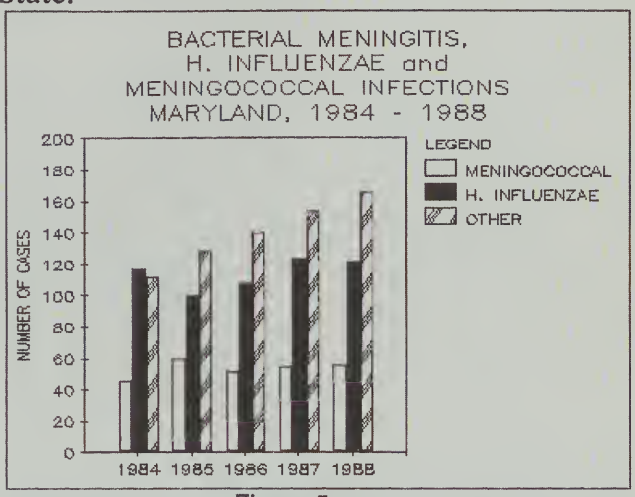

Figure 5

Almost 40% of the cases had onset of symptoms between January and March. The male to female ratio was 1:1. Sixty-five percent of cases were white, 25% black, approximately 4% Hispanic, and 2% Asian. Children, younger than 3 years of age, represented 42.1% of the cases; 15 were 1 to 11 months old, none were newborns (less than 29 days). Eleven cases (19.3%) were 15 to 24 years old.

Thirty-five (61.4%) presented with meningitis, 19 (33.3%) with meningococcemia and 3 had pneumonia. Seven infections were caused by *N. meningitidis*, serogroup B, 7 by serogroup C, 1 by W135, and the serogroup of 42 was either not determined or not reported.

Five (10%) of the 50 patients for whom outcome was known, died. These included a 40 year old Hispanic male who was also HIV positive, a 16 year old female with serogroup B meningitis, resistant to rifampin, a 21 year old female with meningitis and trauma injuries, an 11 year old girl with serogroup C, and a 29 year old female with serogroup B meningitis.

MUMPS (204)
4.5/100,000 (U.S. - 1.9/100,000)

After 6 years of low incidence rates (Figure 4), mumps increased five fold over the 6 year average of 41 cases / year.

Almost one quarter (23.5%) of the patients had onset of symptoms in May, and an additional 16.7% in April and June. School-aged children accounted for 81.9% of the cases, with

81 (39.7%) cases occurring among 10 to 14 year olds. One large outbreak, predominantly in Prince George's County, accounted for 111 (54.4%) of the cases. Higher attack rates for mumps were seen among unimmunized children.

Maryland Immunization Law does not at this time require proof of immunity against mumps for school or day care attendance; however, because of widespread use of measles-mumps-rubella or single-antigen mumps vaccine, over 80% of school children have been immunized against mumps. Mumps vaccine is recommended for all children, adolescents, and adults (especially those born after 1957) who are susceptible; that is, for those who have not had live mumps vaccine after the first birthday, have had physician diagnosed mumps, or mumps titer indicating immunity.

PERTUSSIS (56)

1.2/100,000 (U.S. - 1.2/100,000)

The incidence of pertussis doubled in 1988 compared to 1987 (Figure 4), due to 2 outbreaks. A total of 170 suspected cases of pertussis were reported in 1988, but only 56 met the clinical definition of pertussis as of June, 1989 (including one para-pertussis case and 3 delayed reports from 1987). Six (10.7%) were confirmed by DFA only, 2 (3.6%) by culture only, and 4 (7.1%) by both culture and DFA. Cases ranged in age from 1 month to 35 years. Fifty one (91.1%) were less than 9 years of age and 5 (8.9%) were 9 years or older. Forty-three (76.8%) of the cases had less than three doses of DTP vaccine.

Cough was the most frequently reported symptom, occurring in 55 (98.2%) of the cases, 52 (92.9%) had paroxysmal cough, 37 (66.1%) vomiting and cough, 25 (44.6%) whoop, 19 (33.9%) apnea, 13 (23.2%) cyanosis, and 6 (11.7%) had pneumonia on chest x-ray. Nineteen (33.9%) were hospitalized for 6 to 9 days.

ANIMAL RABIES (338)

The 338 rabid animals reported in 1988 represent a 24.9% decrease from the 450 cases reported in 1987. Raccoons comprised 255 (75.4%) of these cases, with a spillover into foxes (21 or 6.2%), skunks (19 or 5.6%), groundhogs (5 or 1.5%) and deer (1 or 0.3%). Rabies in domestic animals, which represents a greater risk to humans, was reported in 13 cats (3.8%), 2 cattle (0.6%) and 1 goat (0.3%) (Figure 6).

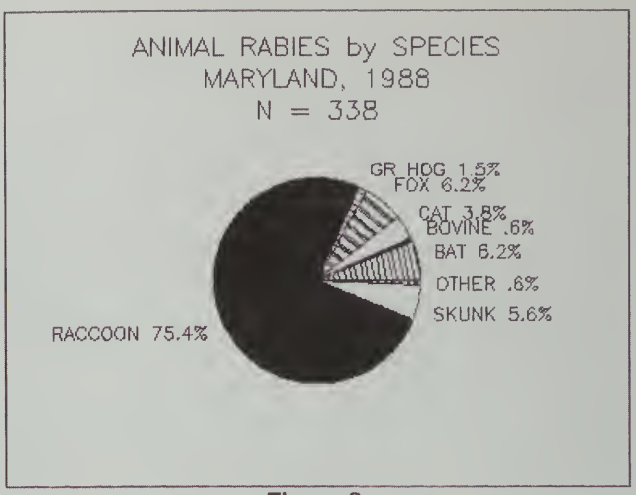

Figure 6

Rabies was confirmed in 21 bats (6.2%). Bat rabies is a separate epizootic cycle and continues to be the only rabies reported south of the Chesapeake and Delaware Canal in Maryland.

The 16 domestic animals are noteworthy. Vaccines are available for dogs, cats, sheep, cattle, and horses; only dogs and cats are required by law to be vaccinated. Although 12 of the 13 rabid cats were being fed or cared for by someone, none were vaccinated against rabies. Sixty-six people received post-exposure rabies prophylaxis following exposure to the rabid cats. Since 1981, when the raccoon rabies epizootic spread to Maryland, cats have accounted for most of the rabies cases in domestic species (67 cats, compared to 16 cattle, and 6 dogs). There are several explanations. Cats are generally more nocturnal than dogs and would be more likely to come into contact with rabid raccoons. Also, cats are often allowed to roam without supervision and may be less frequently vaccinated than dogs.

All wild animals and stray domestic animals should be avoided to reduce the risk of rabies exposure. If an exposure does occur, wild animals should be captured and the brain tested for rabies. Dogs, cats, and farm animals must be quarantined for 10 days following a bite or scratch. If the animal is healthy at the end of the 10 day period, the victim was not exposed to rabies and does not need post-exposure rabies prophylaxis.

To be concluded in the September issue of the Newsletter.

The Best Prescription For Your Practice.

Enhance your revenue and cash flow, stabilize management expenses, and improve staff productivity. With a practice management system from PACE.

With PACE, you're backed by the best in the business. We install your system, train your staff, and provide service and support in your office. We tailor the system to your needs, and give you a custom assistance line direct to your PACE engineer.

Best of all, PACE gives you the functions you need. Electronic insurance claims transmission. Billing and collections. Aged receivable reports. Appointment scheduling and practice analysis. Powerful search and report capability. And much, much more.

Call or write PACE today for more information or a free demonstration. And bring your practice up to PACE.

LEGAL AND ETHICAL CONCERNS OF YOUR MEDICAL PRACTICE

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIV, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and policies Governing the Practice of Medicine in Maryland.

■ ■ ■

In the June issue of the *MMJ*, the Medicolegal Code of Cooperation was reproduced as a guide for attorneys and physicians. On March 20, 1989, the Council adopted "Guidelines To Physicians on Court Subpoenas and Testimony." The co-sponsoring State and Baltimore City Bar Associations have also adopted the following Guidelines, the use of which may reduce occurrences of misunderstandings and abuses of the subpoena:

Guidelines to Physicians on Court Subpoenas and Testimony

In criminal and civil cases where medical care is necessary either for the victim of a crime or the injured party (plaintiff) in a civil matter, the medical record is an important source of information during trial, and its admission into evidence may be stipulated by mutual agreement of the prosecuting and defending attorneys. While additional personal testimony by the physician *may not* be necessary if the record is admitted to evidence, testimony from a treating physician may, under certain circumstances, be either necessary or desireable in the proper representation of the client (in a civil matter) or the State (in a criminal matter). This may be true even when the treating physician has no independent recollection, whatsoever, outside of the documented medical record. Cases where physician testimony may be obtained by subpoena occur mainly as follows:

1. The medical record is illegible, incomplete, or otherwise inadequate.
2. Counsel cannot stipulate to the admission of the medical record into evidence, requiring the presence of the physician to provide the information.
3. Strategical purpose. One or both of the attorneys may believe that the jury, or panel, will not give sufficient attention to written testimony due to variations in reading skill, lack of attention to written materials, etc; or the attorney may wish to impress the jury by calling the physician as an expert witness, or may wish to have the physician physically present to answer questions that might be asked of him or her, directly, by an Arbitration Panel in a Health Claims proceeding.*

If the physician wishes to reduce, as much as possible, the number of times he or she is subpoenaed to give factual testimony, he should attempt to recognize cases where criminal prosecution may result (e.g., battery, rape, child abuse, or personal injury), and make a special effort to see that the medical record is legible, does not contain abbreviations or jargon, and is complete regarding details which the physician might be called into court to add. Examples of the latter are descriptions of the patient's emotional state and clothing, and whether the results of the physician examination are consistent with the patient's story (e.g., if a bruise resembles a coathanger). It may be wise to dictate and edit records of potential legal importance before signing them, to assure legibility, completeness, and correctness. The Maryland State Police form for sexual assault examinations provides a useful format for dictating assault records in general, which can be further supplemented as needed by relevant medical information.

Further, in cases involving personal injury (as opposed to illness), i.e., an automobile accident, a slip and fall, etc., the physician should, in preparing the medical record, recognize the possibility that the injury will result in litigation and that the patient's condition at the time of his or her treatment may be important to the damage aspect of the claim. Therefore, complete and legible charts are of vital importance. The civil courts are particularly interested in a complete history of the facts causing or preceding the injury, an assessment of the patient's condition (including details of all complaints made by the patient and findings on examination), and a determination as to proposed course of treatment.

* There is the question of whether, under these circumstances, the physician is offering testimony as a mere fact witness or as an expert witness so as to entitle him to charge the attorney or patient calling him to testify a fee for expert testimony. This is a controversial area. In criminal cases, expert witnesses subpoenaed by the State will be reimbursed as provided by State laws which apply to individial counties, so that some counties reimburse expert witnesses while others do not. In civil matters, the question of expert witness fees should be resolved with the attorney before the testimony is given. See *Medico-Legal Code of Cooperation* and the *Guidelines Concerning Expert Physician Testimony and Reports.*

A subpoena is a legal document issued by a Court of this State, at the request of one of the parties to the litigation. It is a written order directed to a person and *requiring* that person's attendance at a particular time and place to take the action specified. Assuming the subpoena is properly served, attendance is mandatory at the time and place designated, or at another time mutually agreeable to the witness, the attorney requesting the subpoena and the Court. In general, service of the subpoena may be made upon the physician by a sheriff or by a competent private person (18 years of age or older), including an attorney of record, but not by a party to the action. Proper service is made by serving the individual physician with the documents (subpoena, etc.), or by serving an agent authorized by appointment or by law to receive the subpoena and related documents for the individual.

Please be advised that the medical professional at any stage of his or her medical training may be called upon, by subpoena, to give factual medical testimony and/or expert testimony. This specifically includes interns, residents, nurses and para-professionals including but not limited to CRNAs, physicians assistants, respiratory therapists and physical therapists. A treating physician will be permitted to testify as to the medical treatment rendered by him regardless of the level of training or experience he had achieved at the time the treatment was rendered. It will, however, be up to the court (or panel chairman in an arbitration setting), to determine whether the medical professional subpoenaed has sufficient background and training to qualify as an *expert witness* in the area of specialty in which he is offered.

The Courts of this State have decided that the mere fact that someone has graduated from medical school does not necessarily qualify that individual as an expert. The Court will determine, on a case-by-case basis, whether the physician has gained sufficient knowledge in the specialty involved (through any source including reading and observation), so as to allow him to offer testimony that would be helpful to the trier of fact. Assuming the Court permits a physician in training to offer expert testimony, the testimony becomes admissible. It is then up to the attorneys to argue that the testimony should not be given full weight or be considered authoritative based upon the physician's lack of experience or incomplete training.

Every subpoena shall contain: (1) the name of the case, (2) the name and address of the person to whom it is directed, (3) the name of the person at whose request it is issued, (4) the date, time, and place where attendance is required, and (5) a description of any documents or other tangible things to be produced. All of this information will be of importance in handling any questions that may arise regarding the subpoena.

On motion of a person served with a subpoena to attend a court proceeding (including a proceeding before a master, auditor, or examiner) filed promptly and, whenever practicable, at or before the time specified in the subpoena for compliance, the court may enter an order that justice requires to protect the person from annoyance, embarrassment, oppression, or undue burden or expense, including one or more of the following:

(1) that the subpoena be quashed;
(2) that the subpoena be complied with only at some designated time or place other than that stated in the subpoena;
(3) that documents or other tangible things designated in the subpoena be produced only upon the advancement by the party serving the subpoena of the reasonable costs of producing them or;
(4) that documents or other tangible things designated in the subpoena be delivered to the court at or before the proceeding or before the time when they are to be offered in evidence, subject to further order of court to permit inspection of them.

A person served with a subpoena to attend a *deposition* (not a trial) may seek a protective order from the Court. If the subpoena also commands the production of documents or other tangible things at the deposition, the person served may seek a protective order or may file, within ten days after service of the subpoena, an objection to production of any or all of the designated materials. This objection shall be in writing and shall state the reasons for the objection. If an objection is filed the person receiving the subpoena need not comply until the issue is decided by the Court.

A witness served with a subpoena may be fined and physically taken into custody for failure to obey the subpoena without sufficient excuse. The witness shall be taken immediately before the court if then in session. If the court is not in session, the witness shall be taken before a judicial officer of the District court for a determination of appropriate conditions of release to ensure the witness's appearance at the next session of the court that issued the attachment.

When a physician is subpoenaed, the Medicolegal Code of Cooperation (approved jointly by Med Chi and the Maryland State and Baltimore City Bar Associations) advises prior notification of the physician by the attorney, and further recommends an "on-call" arrangement for the physician during the trials so that the physician does not need to spend the entire day idle in court, to the detriment of the physician's other patients. The Maryland Rules of Procedure governing civil matters (plaintiff v. defendant; claimant v. health care provider) do not contain a provision that requires that a subpoena be served a certain period of time in advance of the trial. The Medico-Legal Code of Cooperation should guide attorneys in this area. The Maryland Rules of Procedure applicable to criminal matters (state v. defendant) do require that the subpoena commanding a witness to testify at a criminal trial be prepared and issued at least nine days before a

trial in the circuit court, or five days before a trial in the district court, not including the day of the trial and intervening Saturdays, Sundays and legal holidays. Even in criminal matters, however, the Rules do not provide that the physician must be served within a certain period of time in advance of trial.

A physician receiving a subpoena should contact the attorney at whose request the subpoena was issued and inquire as to why the physician's presence in court is necessary and should discuss the testimony which the physician could offer. The physician should secure from the attorney or hospital copies of any and all documents that will be important to his other testimony. These materials should be thoroughly reviewed in advance of trial. The physician should bear in mind that the matter of civic duty is associated with participation in any court proceedings, and as always, the patient's interests should be kept foremost.

Physicians should, of course, keep separate and complete records of all legal cases, including a copy of the medical record, any written communications, the subpoena, the date and time that the subpoena is received (this can be jotted on the subpoena itself), and the dates, time, and content of any telephone communications. All relevant records should be brought to court by the physician when testifying (although the court should also have copies of its own, obtained by subpoena).

Physicians who have been victimized by abuse of the subpoena process, and who are unable to resolve the matter through personal action, may find further recourse available through the Medicolegal Committee.

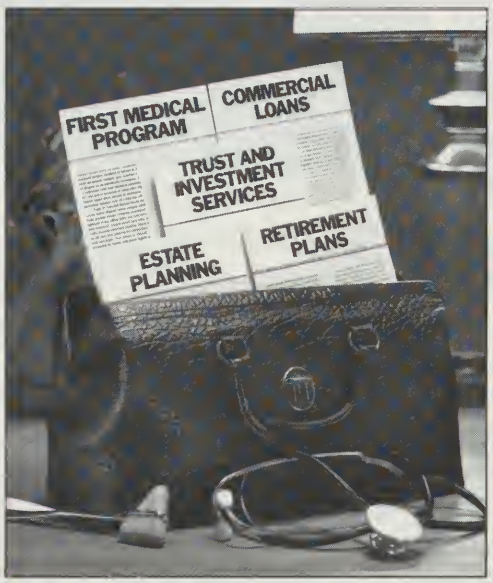
Pending before Med Chi's Council and the Bar Associations are similar guidelines on expert/ witness testimony and reports. When adopted, these guidelines will be published in the *MMJ*. ■

A Wife. Two Kids. And A 30-Year Mortgage. Mark T. Wants To Go Back To Work. We Can Help.

Your accurate diagnosis. Our Industrial Rehabilitation Center professionals. And a return-to-work program that is best for your patient.

With an ultra-modern facility, interdisciplinary staff and state-of-the-art equipment, we feature:

- Job-Specific Work Capacity Evaluations
- Work Hardening Programs
- Independent Medical Examinations
- Disability/Impairment Ratings
- Pain Rehabilitation Programs



Call today. When your patients need to get back to work, they need the Industrial Rehabilitation Center.

Executive Director's Newsletter

August 1989

Expenditure Targets

Maryland physicians are urged to inform their patients about Expenditure Targets, a new proposal in Congress that will seriously threaten the Medicare program. Expenditure Targets are government-set expenditure goals for total physicians services under Medicare Part B. If the targets are exceeded, Medicare physician reimbursement rates will be adjusted downward accordingly and across the board. The initiation of such targets would cause a rationing of care. According to the AMA, "Expenditure Targets would constitute a breach in the basic promise of Congress that the elderly and disabled should receive without delay the care that is reasonable and necessary to meet their health needs." To defeat Expenditure Targets Maryland physicians must encourage their patients to contact their congressmen and ask them to vote "no" on Expenditure Targets.

Med Chi developed the flyer on page A so that Maryland physicians can inform their patients on Expenditure Targets. The flyer contains an explanation of Expenditure Targets and provides the phone numbers of all congressmen Maryland. Physicians are encouraged to make copies to give to patients and post the flyer in their offices. For additional copies contact Betsy Newman, Public Relations for Med Chi at 301-539-0872 or in Maryland 1-800-492-1056.

Membership-Directory Listings

In September Med Chi will publish a new membership directory that will be distributed to all member physicians. Physicians are reminded that they may not legally represent to the public, in any publication, that they are a specialist in any field of medical practice unless identified as such by the Board of Physician Quality Assurance.

Application for specialty designation is open to all licensed physicians in Maryland. Physicians certified by the American Board of Medical Specialists **must apply** to the State Board and will receive identification after the State Board confirms that credential. If not certified by the American Board of Medical Specialists, the physician must complete an application outlining specific training and experience in the requested specialty. The criteria used for such evaluations were developed jointly by Med Chi and the State Board and are set forth in administrative regulations having the force and effect of law.

The advertisement on page C contains a form for physicians who have a change in their name, address, phone number or specialty. **For those physicians not registered with the state board, fill out the application for a specialist identifier on page D.**

AMA Annual Meeting

At the June 29 Meeting of Med Chi's Council, Med Chi's Delegation to the AMA reported on four important issues:

Expenditure Targets The AMA has voiced its strong opposition to Expenditure Targets and has undertaken a major campaign to inform the public about the inevitable rationing of care that will result from such targets.

RBRVS Development of a Non-Medicare Payment System The AMA House of Delegates adopted a position that it supports the development and implementation of a Medicare physician payment schedule but opposes any effort to link the acceptance of an RBRVS with any proposal that is counter to AMA policy.

Covering the Uninsured To adequately address the problem of the 37 million Americans who are uninsured, the AMA adopted the concept of employers providing health coverage.

Curtailing Prescription Drug Abuse while Preserving Therapeutic Use The AMA adopted the positions of opposing expansion of multiple-copy prescription programs, continuing to address the problems of prescription drug diversion and abuse through AMA's programs, and encouraging further research in the development of reliable outcome indicators.

Generic-Substitution Ruling

In May the Maryland Board of Pharmacy issued the following ruling: Physicians will no longer be able to write a "DISPENSE AS WRITTEN" order to require that physicians dispense the brand name drug. Maryland's Medical Assistance Program, in compliance with federal law, mandates that when a specific brand-name drug is to be dispensed, the prescriber must write in his or her own handwriting on the prescription form the phrase, "BRAND MEDICALLY NECESSARY" or "BRAND NECESSARY." Under the Maryland Pharmacy Law, Health Occupations Article, Section 12-508(b)(1) Annotated Code of Maryland, the phrase "DAW" or "DNS" will not require the pharmacist to dispense the brand name. This ruling applies to all prescriptions and was effective July 1, 1989.

Drug Summit

Med Chi participated in Maryland's first statewide drug summit held at the University of Maryland on May 31, 1989. Over five-hundred participants attended this meeting in an attempt to develop new strategies to fight Maryland's drug problem. Members of Med Chi's Committee on Drugs attended the summit and are developing resolutions aimed at ideas discussed during the summit to be presented to the House of Delegates at the Semiannual meeting in September.

Angelo J. Troisi, FACHE
Executive Director

Broken...

In 1965, Congress promised senior citizens medical care.
Now they are breaking that promise.

Today, the government is cutting costs for the Medicare program.
What's more, Congress wants to limit the amount of services offered to seniors by creating "expenditure targets" for physicians.

Expenditure targets are government-set limits on spending for needed health care. These targets could result in a limiting of services similar to the British system where age often determines whether a patient receives needed medical treatments such as renal dialysis, bypass surgery, etc.
This system is unfair and would be devastating for older Americans.

Physicians do not want to see you get less care than you need. But to protect your care, your doctor needs your help. Make Congress keep their Medicare promise.

Contact your Senators and Congressmen today!
Their names are listed on the back of this flyer.
Tell them that you are concerned about the cuts in the Medicare program and urge them to vote "No" for expenditure targets.

Are you *lawfully* a specialist?

Physician specialists in Maryland, ***even*** those who are nationally board certified, are required by Maryland law* to obtain approval from the State Board of Physician Quality Assurance before calling themselves a specialist of any kind.

If you ***have not*** obtained such approval, Med Chi ***urges*** you to complete the form on the back of this page and return it as soon as possible to the State Board of Physician Quality Assurance. The Board will process this application and determine if you may call yourself a specialist under Maryland law.

Whether or not you already have obtained this approval, please fill out the card at the bottom of this page and return it to Med Chi before September 1st. It will be used to update your information as listed in Med Chi's Directory.

** Section 14-704 of the Health Occupations Article (COMAR 10.32.09, Identification of Medical Specialties)*

This form *must* be completed for Membership Directory *and* specialty designation purposes. Return the completed form to Med Chi, 1211 Cathedral Street, Baltimore, MD 21201.

Medical Specialty Identification

The Board of Physician Quality Assurance has adopted COMAR 10.32.09 Identification of Medical Specialties, in order to implement Health Occupations Article 14-704, which provides for the identification of medical specialists by the Board. **A physician may not represent to the public in Maryland that he is a specialist in any field of specialized medical practice unless identified as a specialist in that field by the Board.**

There are two ways to become identified as a medical specialist. They are:

A. Specialty Board certification.

If you qualify as a medical specialist because of specialty board certification, please enclose a $5 fee and photocopy of certification.

B. Evaluation of credentials by a Medical Review Committee.

If you are not American Board of Medical Specialties (AMBS) specialty or subspecialty board certified but wish to be credentialed as a medical specialist in any field of medicine through evaluation of credentials, education, and experience, please enclose a $20 fee ($15 evaluation, $5 identification). The evaluation form will then be sent to you.

From time to time we plan to showcase articles written by physicians who are experiencing computers first hand. By doing this we hope to address areas of expertise in all aspects of the computer. If you have something you would like to share with other physicians such as programs you have written, software you have mastered, or tricks you have learned the hard way, send them along with your name, address, and phone number to Bruno Mattiello, Director of Computer Services, 1211 Cathedral Street, Baltimore, MD 21201.

Our first guest writer is Dr. William Parnes, a member of the Medical and Chirurgical Faculty's Computers in Medicine Committee. His article deals with DeskTop Publishing for the Medical Office.

DeskTop Publishing for the Medical Office A Brief Overview

William Parnes MD

DeskTop Publishing (DTP) is one of the catchwords of personal computing, but traditional publishing is usually not the end product of the activity, and the equipment rarely fits on a desk top. The term has come to refer to a heterogeneous group of activities having as their common theme a printed product, usually with a combination of text and graphics; a single individual controls the activity.

The two themes are important. Individual control represents a major alteration in the way most printed material is generated. The traditional process of designing and producing printed matter usually involves a writer and possibly an editor, an artist, a typesetter, a printer, and often others. The final product may be excruciatingly slow to develop, especially if it is complex with multiple proof copies and corrections.

Using the DTP model, an individual can complete the entire process to the point of volume printing. Art work may be produced electronically. Type may be set in a variety of styles. Photographs may be reduced to bit-mapped images. And all may be laid out, ready for the printer.

Forms for office use may be designed, printed, and later modified easily by the person most concerned with their appearance and content, the user. Flyers, informational newsletters, presentations, magazines, newspapers, and books may all be produced. Not every "publication" will be nominated for a design award, but at least it will reflect the need of the user.

Getting Started: Equipment

The first purchase is a computer. If one is already available, the decision about what to use is simple. If a computer purchase is being contemplated, unless the only use of the system will be for DTP, other considerations should dictate the choice of a system. DTP software exists for virtually all major computer systems. The Macintosh may have started the "revolution," but IBM PC systems and clones, properly equipped, and the Amiga have their proponents for DTP use.

Quality output (the printer) probably is of more importance. The common dot-matrix printer produces copy, that although sometimes of high quality, generally is not adequate as a master for volume printing. Laser printers generally cost more but produce output that for some applications may be used as the master for printing. Phototypesetters produce extremely high quality output but are not useable for normal office printing and are expensive.

Scanners, which convert paper images to electronic form, are not a necessity but allow the inclusion of drawings or photographs produced by conventional means in the computer generated output.

Software For most new computer users, software should dictate the hardware to be purchased. Since most DTP software is purchased after a system has been bought for other purposes, the hardware will determine the software choices.

For simplest purposes, a painting or drawing program may suffice. Graphic elements and some text may be mixed on the same page by these programs, but they work most effectively to produce single-page documents such as flyers or forms.

Word processors, which increasingly have the ability to include some graphic elements in the body of the text, are good choices for longer, primarily text documents and have the advantage of being multipurpose. Books have been successfully produced with this category of software (examples of word processors aimed at DTP use are Microsoft Word, WordPerfect, and FullWrite).

For newsletter, magazine, or newspaperlike layout, a true layout program is the best choice for flexibility, allowing considerably more freedom in design than the word processors. Examples of programs include PageMaker, Ventura Publisher, Ready-Set-Go, and Quark Xpress.

Firmware A text of page design is a wise choice for any first-time publisher trying to produce a document for distribution or general use. Although DTP allows freedom to experiment, there are certain tried-and-true principles of page design worth knowing as starting points.

Cost

As with all computing endeavors, DTP has no upper limit on expense. Given that the computer is available, a Laser Printer with 300 dot per inch resolution may cost $2,000 **without** the PostScript Language page description interpreter or $5,000 with it. Phototypesetters generally exceed $15,000. Laser printers, and higher quality printers, are often available for use at service bureaus that charge for their use either by time or by the number of pages produced.

The software may cost less than $100 or several thousand dollars depending on the system and the program chosen.

Who

Each individual has to decide on his or her needs. DTP is not for everyone, but if you have a computer and have produced meeting announcements or forms for your office, you already may be a practitioner of DTP.

Virtually every medical office uses forms. Personalizing them becomes easier with the tools of DTP. Informational brochures containing precisely what you want to say to your patients may be produced without the necessity of having to explain your ideas to people not expert in medicine. High-quality announcements for mailing or posting in an office may be produced easily.

Conclusion

DTP is an extension of many personal computing ideas. In a medical office with the tools of DTP there is opportunity to personalize the printed materials and to enhance physician-patient communication. Many of the techniques require some practice and a knowledge of design, but the results are generally worth the effort. ■

Regional Chemotherapy: Pharmacokinetic Basis and Clinical Applications

The pharmacology of anticancer drugs and biologic behavior of tumors are most important factors in comprehending the basis of regional chemotherapy. Of all disciplines of pharmacology, pharmacokinetics makes the greatest impact on therapy of cancer. With the knowledge of pharmacokinetics, decisions on the route of administration, dosing schedule, and effective drug level in body fluids can be made scientifically sound. These decisions are critical in cancer chemotherapy since the therapeutic margin between the antitumor effect and normal tissue toxicity is extremely narrow.

In infectious disease chemotherapy, the goal is to keep adequate concentration of the antibiotic above minimal inhibitory concentration but below the toxic level to host. This goal cannot be practically achieved with systemic chemotherapy because of narrow therapeutic margin. In solid tumors confined to one organ or region of the body, however, a high concentration of chemotherapeutic drug could be achieved by regional chemotherapy without systemic toxicity. The modern developments in and safety of infusion catheters, arterial pumps, intraperitoneal catheters and isolation-perfusion devices using heart-lung machines enhances the safety of regional chemotherapy. Understanding of pharmacokinetic principles of the regional chemotherapy and biologic behavior of tumors has increased its us.

The premise of regional chemotherapy is based on controlling the cancer while it is confined to one region of the body. Furthermore, by achieving tumor regression in localized disease, the local and regional recurrence and subsequently systemic spread of the cancer could be controlled. Similarly, tumor regression achieved by regional chemotherapy could render the unresectable tumors resectable.

Basic Pharmacokinetics

Pharmacokinetic principles are specifically based on variation of the drug concentration *vs.* time as a result of absorption, distribution, biotransformation, and elimination of the drug. Eight parameters can alter the course of regional chemotherapy:

1. *Availability of the drug (F) fraction of the drug reaching the target organ:* This is usually ideal because 100 percent of the drug reaches the target organ in hepatic or other regional arterial infusion. However, it could be less ideal in intraperitoneal administration because of intraperitoneal adhesions.

2. *Volume distribution of the drug in the area of infused or perfused:* The drug has to be distributed evenly in organ infused. Therefore in clinical practice, arterial radionuclide infusion scans, intraperitoneal gastrograffin roentgenograms, or fluorescein injections in perfusion circuit of extremity is commonly utilized.

3. *The circulation of the organ perfused:* If the blood flow is high the "flushing" of the drug through the organ occurs in first and subsequent passes of drug. Pharmacokinetically, slowing the inflow of the arterial blood volume offers the best results. This principle is used in hepatic dearterialization and with biodegradable starch microspheres intraarterial chemotherapy for hepatic malignancies and tourniquet infusion chemotherapy in recurrent melanomas.

4. *Initial and terminal half-life of drug:* The ideal drug should have a short initial half-life for better distribution. The drugs with short terminal half-life are preferred in isolation perfusion circuits in melanoma of extremity.

5. *Binding of the drug to plasma protein:* Ideal drug used for regional chemotherapy should have loose binding to plasma so that tissue penetration could be easily facilitated.

6. *Clearance of the drug by metabolism and excretion:* The drugs that must be activated by other organs to get an active metabolite such as cyclophosphamide cannot be used for regional chemotherapy. Ideally the drug must be metabolized and cleared in nonactive form by the target organ. FUDR and 5FU are good examples for hepatic arterial chemotherapy.

7. *Effective and toxic concentration of drugs in the target organ vs. concentration in systemic circulation:* This principle can be best achieved in regional perfusion where complete isolation of circulation of the part of body is possible by using tourniquet and regional arterial-venous control.

8. *Urinary excretion of the unchanged drug:* The drug that is not metabolized by the target organ should be easily excreted by the kidneys, thereby avoiding systemic toxicity.

Among many methods of regional chemotherapy administration, the most widely used methods (intraarterial infusion of liver, extremity, and head and neck areas; isolation perfusion chemotherapy of extremity; intraperitoneal administration; and portal vein infusion of the liver) will be discussed in future communications.

MUKUND S. DIDOLKAR MD
Associate Professor of Surgery and Oncology

Tumor conferences are held weekly on Tuesday between 8 and 9 a.m. in Room N13E28 at the University of Maryland Medical System. Physicians are welcome to attend this open meeting and to present cases and pathological slides. Call the number below by noon Monday to be placed on the schedule.

Surgical Oncology Program at the University of Maryland Medical System, Room N13E02, Baltimore, MD (301-328-5224). ■

Your concern about liability insurance is our concern.

Pro Update

Maryland's PRO is the Delmarva Foundation for Medical Care, Inc. (DFMC).

Many physicians have expressed concerns regarding PRO actions and communication problems. To help Maryland physicians better understand the federally regulated PRO requirements and how the review-denial-appeals process works, the Maryland Medical Journal, in cooperation with Delmarva, publishes PRO Update in an attempt to define and clarify these issues, often by using case examples to illustrate general topics. We welcome readers' comments regarding the impact of these regulations on the quality of care delivered to patients.

JOHN A. SINGER MD, Chairman
Medical and Chirurgical Faculty
Peer Review Organization Monitoring Committee

Case Example with a Confirmed Quality Problem

There are two main categories of review: Quality Assurance and Utilization Review. Each case selected for review undergoes what is referred to as a "full-menu" review, covering both quality and utilization issues. We present a case demonstrating an instance in which there was an identified quality problem but no utilization concern was found.

Clinical Course Mrs. Bland, a 66-year-old female, was admitted on January 12, 1989 to a local hospital from a long-term care facility for shortness of breath. She had been hospitalized one month prior for hyperkalemia, ventricular tachycardia, seizure, and renal insufficiency.

Patient had a history of congestive cardiopathy, ventricular aneurysm, MI, hypertension, macular atrophy, and right mastectomy. Mrs. Bland was admitted to the CCU with probable end-stage congestive cardiomyopathy and possible sepsis, possible new MI. She was given oxygen and IVs were started in her left hand (Cefobid through Heparin lock), left foot (D5.2 Saline with KCL), and right hand (dopamine drip).

During the first 12 hours her mental status improved, her output improved, and her temperature returned to normal. BUN began to drop very gradually.

From January 12-14, the patient was closely monitored and her condition appeared stabilized. On January 14 the attending physician left town, to return on 01/17/89. He wrote orders for his partner to cover for him.

At 3:40 am on 01/16/89, Mrs. Bland complained of discomfort in her right hand. Nursing service noted her right hand and fingers "remain swollen - swelling seems to have increased." Warm compresses were applied to the IV site, and it was noted that there was good blood return and was no redness. The patient's hand was elevated.

At 9:15 am on 01/16/89, the consulting cardiologist made rounds and was "made aware of right hand edema." The order was written to "maintain IV sites" and the physician's progress notes written at that time state "BUN down to 55, no complex arrythmias. Right forehand - fingers swollen from IV infiltration and ? Dopamine." At 12:15, the hand was again noted to be edematous. Warm compresses and elevation were continued. At 6 pm it was recorded that the right hand was slightly reddened over the edematous area. At 9 pm nurses noted that hand and fingers remained swollen, warm, and darkened, and the above treatment was continued.

At 3 am on 01/17/89, the patient complained of discomfort above the IV site. It was noted there was no redness, but the area "is slightly firmer than earlier." The IV site "still has good blood return, but the IV is discontinued." At this time the nurse's notes state, "as the dressing was removed, a small piece of skin was pulled off. The sight was cleansed and Op-site applied." The dopamine drip was placed where the Heparin lock had been located on the left hand. The patient's arm and hand were noted to be swollen, dark, and red at 6 am. The other two IVs remained patent. The patient's attending physician made rounds that morning 01/17/89 at 8. He examined the hand and saw it was discolored and blistering and gave Mrs. Bland a subcutaneous injection of Regitine mixed with saline. Warm compresses were applied to the elevated hand for the rest of the day. At 4 pm, the nurses documented that the area of edema was increasing.

A plastic surgeon saw the patient in consultation on January 18. At that time "no apparent skin loss" was noted, and conservative therapy was recommended. The surgeon recommended continuation of cephalosporin to prevent cellulitis, and bedside ROM exercises. That day, it also was noted the patient was alert, her PO intake increasing, she had no angina, no dyspnea, and her output was down.

On 01/19/89, the skin on Mrs. Bland's hand began sloughing. Her cardiac, pulmonary, and renal functions continued to improve, but the conservative treatment rendered to her right hand did not resolve the tissue damage. Over the course of the next two weeks, the extent of the problem became evident as Mrs. Bland's skin continued to slough. It finally became apparent that a full thickness of skin loss had occurred.

On 02/04/89, the patient was taken to the OR for debridement and skin graft. She tolerated the proce-

dure well and was returned to the long-term care facility in stable condition on 02/06/89.

The Review Process On 03/08/89, the hospital submitted a complete bill to Blue Cross of Maryland. After the claim was paid, the billing data was transmitted to the PRO's data processor.

On 04/03/89, 1989, Mrs. Bland's case was identified for review by random selection. The PRO notified the hospital's medical records department to provide a copy of the medical record.

The medical record was reviewed by the nurse reviewer on 04/14/89. Every day of the hospital stay was found to be acute, and no utilization problems were noted. However, Health Care Financing Administration (HCFA) generic screen 6, "Trauma Suffered in the Hospital," was met. The case was referred to a physician advisor for further review for a possible quality problem. (Note: The generic screen review process will be discussed in next month's PRO Update.)

The physician advisor reviewed the medical chart and expressed concern about two points. First, he thought it would have been more appropriate to move the IV site to a large vein as soon as possible. Supplying dopamine in a small hand vein through a small catheter for 5 days without changing the IV site was believed to be a possible quality problem. The second issue was that the patient's hand had been swelling for 3 days prior to the discontinuation of the IV site, but apparently it was discontinued only after the skin began to slough.

On 04/21/89, a letter was sent to the patient's attending physician describing the DFMC physician advisor's concerns. The attending physician was invited to provide additional information within 20 days.

On 04/29/89, the attending physician responded in detail with the following information:

1. The consulting cardiologist had agreed with the dopamine therapy when the course was initiated.
2. There had been no evidence of IV site problem on January 12, 13, and 14, before he went out of town and had his partner cover.
3. The cardiologist was to see the patient over the weekend as well.
4. The cardiologist was aware of the right hand edema on 01/16/89 and ordered the nursing staff to maintain the IV site.
5. When the partner made rounds shortly after the cardiologist saw Mrs. Bland, he was not made aware of the problem.
6. As the appearance of the IV site worsened throughout the day, there is no notation that a physician was called.
7. The site was discontinued by the nursing staff at 3 am on 01/17/89 and the dopamine line was placed in the previous Heparin lock.
8. When the attending returned at 8 am the area was blistered and discolored. He immediately injected the patient with Regitine intradermally.
9. This case had been discussed with the Director of Nursing for CCU. While there is no specific IV Dopamine routine, the general policy for peripheral IV sites is that they be changed every 48 hours, unless the nurse requests an extension from the physician. This extension is to be reflected in the orders. It is a nursing responsibility to maintain IV sites.

The attending believed that Mrs. Bland's case represented a breach in nursing policy. He thought the cardiologist, when he made rounds, probably was not aware the line had been in the same site for four days when he wrote the order to maintain it.

The attending stated he believed it was inappropriate to consider him liable for the adverse occurrance when he was away during the critical time period. He acknowledged the case had been referred for review to the QA Department and the Nursing Department of his hospital.

On 05/08/89 this additional information was reviewed by the physician advisor at the Foundation. The decision was to write to the cardiologist, the Director of Nursing, and the QA Committee requesting additional information on any action taken.

Responding on 05/22/89 the consulting cardiologist provided additional information that on 01/15/89, he had worked with the nursing staff to try to move the IV sites on Mrs. Bland, but the attempts were unsuccessful. This had not been recorded in the medical record. He believed the right hand had been slightly swollen on admission due to previous right mastectomy. Since there was excellent blood return at the time of his visit on 01/16/89 and no skin changes were noted, he did not feel a change was warranted. After he made his rounds, he was not notified of the changing appearance of the IV site as the day progressed.

The Quality Assurance Committee responded on 05/26/89 with essentially the same information provided by the attending physician in his original response.

These additional responses were reviewed by the Foundation's physician advisor on 06/05/89, who believed this case represented a Level 3 quality problem (medical mismanagement with significant adverse effect for the patient). He thought the nursing department was responsible for the problem because they did not notify the physician of the worsening condition of the IV site in a timely fashion. On 06/09/89, the nursing department of the hospital was notified of the Foundation's findings. The case was then entered into the quality tracking data system; this computer data base "tracks" problems both by responsible physician and hospital department in terms of severity and type of confirmed problem. Quarterly profiles of problem patterns are generated and further interventions taken accordingly.

PRO Update is contributed by the Publications Committee of the Delmarva Foundation for Medical Care, Inc. (Donald Harting MD, MPH, Chairperson; Carol Lewis MPH, ScD; and Jan Melhunek MHS) in cooperation with the Med Chi Peer Review Organization (PRO) Monitoring Committee, John A. Singer MD, Chairperson. ■

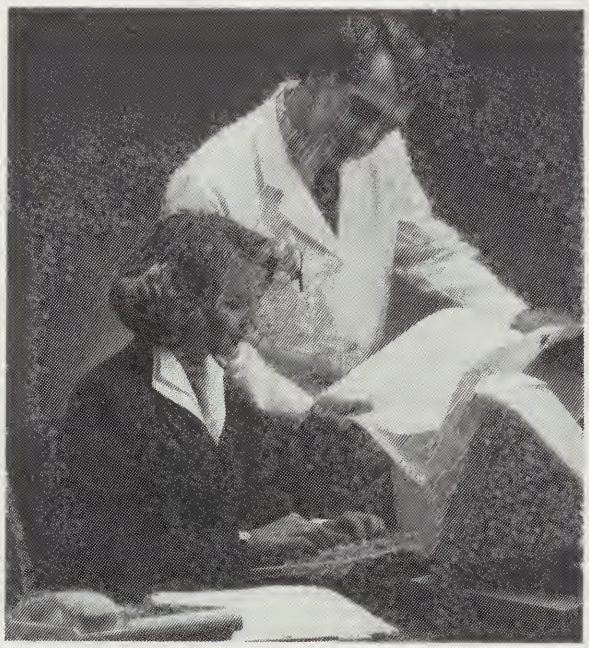
Emergency Psychiatric Beds 800-492-0610

Where do you draw the line?

As a mental health professional, you know that every patient represents a unique challenge. In most cases, you are able to meet each person's individual needs with effective treatment and positive results.

But there are some cases that frustrate the best efforts of the most dedicated professional . . . individuals whose problems seem resistant to every avenue of outpatient treatment. As a concerned professional, where do you draw the line between giving patients your best and drawing on the inpatient resources of others?

For more than 80 years, Taylor Manor Hospital has provided welcome support to fellow professionals faced with the patient in need of our inpatient setting. Our multi-disciplinary approach welcomes your input and provides a broad base of psychiatric services, including specialized treatment programs for adolescents, adults, young adults, addictive behaviors, and members of the ministering profession.



We're here to use all our experienced staff and facilities to assist you in working with your patients. For further information or to arrange admission, contact our Admissions Office at **1-800-527-8238, (301) 465-3322 or (202) 621-4965.**

One Minute With Diabetes

Diabetes and Impotence

Doctor, my gun has run out of bullets. What is my problem?

This 60-year-old man has had noninsulin-dependent diabetes mellitus (NIDDM) for about five years and a long history of ethanolism with only an occasional slip in recent years. He has had three marriages and several live-in companions between marriages. He has been a heavy smoker and chronically overweight.

Libido or sexual desire usually is not diminished in the diabetic male, while impotence can be a frustrating and very real problem. An impotent male is forever grateful to a physician who takes an interest in his problem or makes a referral to a suitable diagnostic center rather than saying something like "You have had your period in the sun, learn to be satisfied in the shade."

Etiology of Impotence

Organic - 85 percent
- *Neurologic* - diabetes mellitus, pelvic trauma, pelvic surgery, cord trauma, demyelinating lesions
- *Vascular* - arteriosclerosis, pelvic surgery, pelvic trauma, veneous shunting
- *Postsurgical* - prostatectomy, radical cystectomy, abdominal perineal resection of rectum and anus
- *Drugs* - alcohol, tranquilizers, antihypertisnive agents, antidepressants
- *Hormonal* - low serum testosterone, high serum estrogen, hypercortisolemia, hyperprolactinemia
- *Other* - carcinoma of the prostate, aging

Psychologic - 10 percent
Idiopathic - 5 percent
Combined etiology - ? percent

Treatment

Evaluation Tools

History and physical examination

Laboratory studies:
CBC, biochemical profile, serum FSH & LH, serum testosterone, and serum prolactin

Nocturnal penile tumescence monitoring

Psychological evaluation:
Multiphasic personality inventory probably is adequate

Neurologic examination

Vascular examination:
Penile blood pressure plus penile brachial index
Selective pelvic vessel arteriography
Dynamic cavernsoscopy in selected patients
Intracavernosal papaverine

Where there is no obvious organic cause for impotence, psychotherapy may be helpful. In the realm of prescription treatment, yohimbine HCl (Aphrodyne, Yocon, Yohimex), which blocks presynaptic alpha-2 adrenergic receptors, is sometimes beneficial in men with mild partial impotence.

If serum testosterone level is low, androgen is sometimes administered. Intracavernosal injection of vasoactive drugs (for example, papavarine, phentolamine, and prostoglandin E) produce erections in many impotent men by relaxing smooth muscle of the erectile spongy tissue.

Several surgical revascularization procedures allow restoration of the blood supply to the corpora. Other treatments include penile implants, suction constriction devices, external mechanical aids, and sexual partner cooperation and encouragement.

Our New Brain Injury Unit Gives People The Chance To Live Their Lives Again.

Each year some 700,000 Americans experience traumatic brain injury. Most survive. But they deserve more. They deserve the chance to live productive lives again, a chance made possible by the Sinai Rehabilitation Center's new in-patient Traumatic Brain Injury Unit.

Our special unit helps brain-injured patients regain motor skills, speech, daily living functions and independence. And with our outpatient day programs and vocational services, we now provide the total care and commitment necessary to help brain injury patients return to home, community and even the workplace. Survival is just a start. At the comprehensive Sinai Rehabilitation Center, we're giving people the chance to live their lives again.

Also present were members of the Faculty staff.

Roll Call

There being a quorum present, President Dobridge proceeded with the roll call of the various Nominating Committee groups, and it was confirmed that adequate representation was present as required by the Faculty Bylaws.

Motion - Mandated Medicare Assignment Means Testing

The President presented the motion adopted by the House of Delegates on September 24, 1988, which reads as follows:

> That the Delegates poll the members in their component societies in cooperation with Med Chi on the issue of Mandated Medicare Assignment and the acceptance or nonacceptance of a 'means test,' and further, that a special meeting of the House of Delegates be held in November at a date to be announced for the purpose of assuming a Med Chi position relative to Mandated Assignment and a means test.

The President announced that in compliance with the direction of the motion, a communication was mailed to members of the House on October 6, 1988, requesting a poll of their respective component membership be conducted to ascertain their opinion as to whether Med Chi should support or deny support of the establishment of a Medicare "means test" in Maryland, and to reaffirm Med Chi's position opposing Mandated Medicare assignment. The results of the poll were presented to the House as follows:

Of 26 component societies responding (prior to the meeting):

21 Opposed to Mandated Medicare Assignment and/or Means Testing
1 Abstention
1 Deferred to position of House of Delegates
3 No official responses received

House Vote

Following a brief discussion, the House of Delegates voted unanimously to reaffirm its position to **not** support the establishment of a Medicare means test in Maryland.

The President adjourned the meeting at 9:14 a.m.

HAROLD B. BOB MD, Secretary

1 Out Of Every 4 Medic Computer Systems Is Bought To Replace Another System.

Here's Why.

Too many practices find out about weak support too late. The smallest glitch takes hours of searching for help that never comes. The distributor went out of business. The software people say it's the hardware. And the hardware people don't answer the phone.

With Medic, that can't ever happen. Since we are the system developers, we can provide all the hardware and software expertise you'll need.

We start by assessing your practice's current needs and even the space you've got for computer stations. Then we follow through, with everything from helping you custom design your bills to seminars on getting the maximum benefit from your system.

That's the security Medic provides to more than 6,000 doctors in 2,000 practices from coast to coast. And it's backed by a $2.5 billion organization. Plus Texas Instruments hardware, with its excellent track record for reliability and expandability.

For a system you can start with and stay with, call Medic. Specialists in computer systems for America's medical community.

Also present were members of the Faculty staff.

Invocation

Dr. Leslie R. Miles, Jr., Chairman of the Committee on Medicine and Religion, delivered the invocation.

Guests

The President introduced the following guests to the members of the House:

Dr. John L. Clowe, Speaker of the AMA House of Delegates
Dr. Edward Annis, former President of the AMA
Dr. J. Thomas Hulvey, President, Medical Society of Virginia

President's Remarks

The President addressed the House and expressed his appreciation for the privilege of serving as President.

Minutes Approved

The minutes of the Semiannual Session of the House of Delegates, Saturday, September 24, 1988, and the minutes of a Special Meeting of the House held on November 19, 1988, in Baltimore, having been distributed to all members and corrected and approved by the Executive Committee, were approved by the House of Delegates.

Necrology

The members of the House of Delegates rose in respect for deceased colleagues as the Secretary read the following necrology:

Allegany County

James P. Hallinan, MD	December 10, 1988

Treasurer's Report

Dr. Jose M. Yosuico, Treasurer, made a brief report on the 1989 budget as adopted by Council and distributed to all members prior to the meeting.

Bylaws Committee Report

The President advised the members of the House that the "consent calendar" procedure would be used for the report of the Bylaws Committee. Following a review of the issues of the report by Dr. Alex Azar, Chairman of the Bylaws Committee, Items 1, 2, 3, 4, 5, 6, and 9 were extracted for discussion.

Dr. Azar, on behalf of the Bylaws Committee, moved adoption of bylaw amendments, Items 7 and 8 of the report, which were adopted unanimously, as follows:

Item 7. Proposed Bylaw Amendment to Liaison Committee with Third Party Carriers - ADOPTED

Amend Article XI, Section 13 (Liaison Committee with Third Party Carriers), by substituting for it the following new Section 13:

> Section 13. A Committee on Managed Care and Third-Party Liason consisting of not less than (7) members shall be appointed by the President, who shall designate the chairman. Its charge shall be to monitor developments involving managed systems of health care delivery at the local, state and national levels. It shall seek resolution to problems and complaints raised by physicians involving health care maintenance organizations regarding quality of care and patient disposition in the hospital or private setting. It shall also seek resolution of problems and complaints raised by physicians regarding arbitrary, impractical, unreasonable, or unpleasant practices and procedures of third-party carriers. The committee shall not attempt to adjudicate individual physician fees or charges, and is not empowered to discuss fee schedules or other matters that would involve illegal actions under state or federal antitrust regulations. This charge does not include liaison currently engaged in by the liaison committee with the Medical Assistance Program.

Item 8. Proposed Bylaw Amendment to Dissolve the Committee on Physician Assistants as recommended by Executive Committee - ADOPTED

Amend Article XI, Section 24 (Committee on Physician Assistants), by striking it in its entirety, as follows:

> Section 24. A Committee on Physician Assistants of at least three members shall be appointed annually by the President who shall designate the Chairman. The Maryland Academy of Physician Assistants (MAPA) shall submit names of Physician Assistants to the President for consideration as ex-officio members of this committee. At least one Physician Assistant shall represent the MAPA Board of Directors. In addition, the Legislative Aide for MAPA shall represent it as an ex-officio member. Physician nominees shall be submitted by MAPA to the President for consideration. These physicians should currently supervise, have supervised in the past, or work or have worked in association with Physician Assistants. The committee shall have as its duty the monitoring of developments in the Physician Assistant profession at local, state and national levels and the dissemination of such information as it obtains to the House of Delegates, appropriate Faculty committees, component societies and individual members of the Faculty. The committee may make recommendations to the Faculty's governing bodies, appropriate Faculty committees and component societies.

Dr. Azar, on behalf of the Bylaws Committee, moved adoption of the following bylaw amendment, Item 1 of the report which, after debate, was rejected by the required 2/3 vote of the House:

Item 1. Proposed Bylaw Amendment to Provide Voting for Emeritus Members in the Council - REJECTED

Amend Article II, Section 5 (Emeritus Members), following the words "They shall have the rights accruing to associate members" by inserting the words,

> and they shall have the right to serve on the Council with voting privileges.

Dr. Azar, on behalf of the Bylaws Committee, moved adoption of the following bylaw amendment, Item 2 of the report, which, after debate and amendment, was adopted by the required 2/3 vote:

Item 2. Proposed Bylaw Amendment to Establish a Committee on Specialty Societies - ADOPTED AS AMENDED

Amend Article XI (Committees), by inserting the following new Section 35, subsequent sections automatically being redesignated:

> Section 35. A Committee on Specialty Societies composed of representatives of Maryland specialty societies as recommended by the specialty societies (and as identified by the Council) shall be appointed annually by the Faculty President, who shall also appoint the Chairman. Each specialty society shall be authorized one designee and an alternate, who shall be members of Med Chi. The committee shall review issues concerning interdisciplinary and multidisciplinary problem areas of medical practice as they relate to each specialty. The Committee shall present issues to the Council for adoption, thereby lending the full force of organized medicine within the State of Maryland to an issue which may affect only one specialty. The Committee shall select from its membership, seven delegates (and seven alternate delegates) as representatives to the Faculty's House of Delegates, and one member to serve on the Faculty's Council.

Dr. Azar, on behalf of the Bylaws Committee, recommended adoption of Item 3 of the report, which, after debate and amendment, was adopted by the required 2/3 vote:

Item 3. Proposed Bylaw Amendment to Clarify Council Composition- ADOPTED AS AMENDED

Amend Article VII (Council), Section 1, by substituting for it the following new section:

Section 1. The Council shall be composed of the elective officers of the Faculty, the immediate past-president, the delegates to the American Medical Association, the deans of medical schools within Maryland, representatives of component medical societies, and a representative of the Committee on Specialty Societies who shall serve for a term of one year.

Following withdrawal of the request for extraction of Item 4, Dr. Azar, on behalf of the Bylaws Committee, recommended adoption of Item 4 of the report, which was adopted unanimously:

Item 4. Proposed Bylaw Amendment to Include Members of the Committee on Specialty Societies in the House of Delegates - ADOPTED

Amend Article VI (House of Delegates), Section 5, by rephrasing the first sentence to read

The members of the House of Delegates, each of whom shall have one vote (past-presidents excepted), shall consist of:

and by inserting the following new subsection (f), all subsequent subsections being redesignated:

(f) Seven delegates selected by the Committee on Specialty Societies, and one alternate delegate for each of the seven delegates. Alternate delegates shall take no part in meetings unless sitting for a delegate. Delegates and alternate delegates shall serve for a term of one year.

Dr. Azar, on behalf of the Bylaws Committee, recommended adoption of the following bylaw amendment, Item 5 of the report, which, after debate, was rejected by the required 2/3 vote (27 ayes, 57 noes):

Item 5. Proposed Bylaw Amendment to include Vice-Presidents as members of the Executive Committee - REJECTED

Amend Article VIII (Executive Committee), Section 1, following the words "...the Immediate Past-President..." and before the words "...the Secretary..." by inserting the words "the First, Second and Third Vice Presidents."

Amend Article VIII (Executive Committee), Section 3, in the last sentence, following the words "A quorum of the Executive Committee shall be..." by striking the word "three" and inserting the word "four..."

Dr. Azar, on behalf of of the Bylaws Committee, recommended adoption of the following bylaw amendment, Item 6 of the report, which, after debate, was adopted by the required 2/3 vote (58 ayes, 22 noes):

Item 6. Proposed Bylaw Amendment to Incorporate into Committee Function Activities Involving Quality Assurance, Risk Management, Model Hospital Medical Staff Bylaws, and Consultation with Outside Organizations - ADOPTED

Amend Article XI, Section 12 (Committee on Hospital Medical Staffs) by substituting for it the following:

Section 12. A **Committee on Hospital Medical Staffs** shall be appointed by the President from a list of Med Chi members provided by each hospital medical staff who are either designated as delegates to the American Medical Association Hospital Medical Staff Section; and/or who have involvement and expertise in hospital quality assurance activities. Its chairman shall be appointed by the President. The committee shall consult with the Department of Health and Mental Hygiene, medical staffs, professional liability insurers and the Maryland Hospital Association regarding quality assurance programs, risk management programs, complaint investigations, and any other matters concerning the establishment of medical standards in hospitals. The committee shall also monitor legal issues including hospital medical staff bylaws on the local, state and federal levels. The committee shall work with and coordinate activities with the Hospital Medical Staff Section of the American Medical Association.

Dr. Azar, on behalf of the Bylaws Committee, recommended adoption of the following bylaw amendment, Item 9 of the report, which, after debate, was recommitted to the Bylaws Committee for further consideration and report to the House of Delegates at the 1989 Semiannual Meeting:

Item 9. Proposed Bylaw Amendment to Restructure the Committee on Public Health - RECOMMITTED

Amend Article XI, Section 28 (Committee on Public Health), by substituting for it the following new Section 28:

Section 28. The **Committee on Public Health** shall consist of a chairman (or two co-chairmen), and the chairman of each subcommittee, all of whom shall be appointed by the president. It shall consider and advise upon all aspects of public health and preventive medicine. It shall maintain continuous liaison with the Department of Health and Mental Hygiene, federal agencies and with the private sector. It shall act in an educational capacity and as a consultant to these groups in evaluating quality of care, experimental programs involving alternative methods of health care delivery, and in any other area wherein improvement of public health and preventive medicine services may be undertaken. The committee shall monitor developments involving allied health professionals at local, state, and national levels and may make recommendations to the Faculty's governing bodies. The Committee on Public Health shall direct and coordinate the activities of its subcommittee in areas of immunology and infectious diseases; AIDS; maternal health and welfare; child and adolescent health adolescent health and welfare; sports medicine; long-term care and geriatrics; alcoholism and chemical dependency; occupational health; and mental health. Through its subcommittees, the Public Health Committee should have the following as its operating goals: articles for possible publication in the *Maryland Medical Journal*, development of seminars/conferences for physician groups, as well as the public at large, and the development of a program to be presented during Med-Chi's annual meeting.

Amend Article XI, Section 1 (Committee on AIDS), by striking it in its entirety and inserting the following new section as subsection (a) of the Committee on Public Health:

(a) **Subcommittee on AIDS** - A subcommittee of at least five members shall work toward educating the public and the membership with respect to all aspects of AIDS. It shall review current medical treatment and policies of industry, housing, hospitals, and schools with respect to AIDS patients, present scientific information relative to AIDS, and shall offer its services to component medical societies, hospital medical staffs, local and state health departments and school systems. The subcommittee may cooperate with government and private agencies working in the field of AIDS and invite the attendance of physicians and nonphysician members of such agencies to work with the subcommittee on a nonvoting basis. It shall also have cross-representation with the Subcommittee on Immunology and Infectious Diseases.

Amend Article XI, Section 2 (Committee on Alcoholism and Chemical Dependency), by striking it in its entirety and inserting the following new section as subsection (b) of the Committee on Public Health:

(b) **Subcommittee on Alcoholism and Chemical Dependency** - A subcommittee of at least five members shall work toward educating the public and the membership with respect to alcoholism and chemical dependency as illnesses; present scientific information to physicians relative to alcoholism and chemical dependency; and offer its services to hospital medical staffs in an attempt to have such members understand alcoholism and chemical dependencies. The subcommittee may cooperate with government and private agencies working in the field of alcoholism and chemical dependency and invite the attendance of physicians and nonphysician members of such agencies to work with the subcommittee on a nonvoting basis.

Amend Article XI, Section 28 (Committee on Public Health), by inserting the following new subsection (c):

(c) **Subcommittee on Child and Adolescent Health and Welfare** - A subcommittee of at least five members shall report to the Committee on Public Health on all matters involving infant, child and adolescent health.

Amend Article XI, Section 28 (Committee on Public Health), by inserting the following new subsection (d):

(d) **Subcommittee on Immunology and Infecitious Diseases** - A subcommittee of at least five members shall report to the committee on public health on all matters involving immunology and infectious diseases. It shall also have cross-representation with the Subcommittee on AIDS.

Auxiliary Past President, Bobbie Niklewski, admires a treasure at the AMA-ERF Auction in the Cameo Ballroom at Turf Valley.

Amend Article XI, Section 15 (Liaison Committee with the Department of Health and Mental Hygiene), by striking it in its entirety and inserting the following new section as subsection (e) of the Committee on Public Health:

(e) **Subcommittee on Liason with Medical Assistance Program** - A liaison subcommittee with the Medical Assistance Program consisting of five members shall maintain continuous liaison with the Medical Assistance Program, the payments made under such programs to providers of health care services, and all other facets of operation of this program. It shall act as a consultant to the Medical Assistance Program in evaluating the quality of care, experimental programs involving alternative methods of delivery of care and any other area wherein improvement of health services provided to medical assistance patients may be undertaken.

Amend Article XI, Section 16 (Committee on Long-Term Care and Geriatrics), by striking it in its entirety and inserting the following new section as subsection (f) of the Committee on Public Health:

(f) **Subcommittee on Long-Term Care and Geriatrics** - A subcommittee of at least five members shall have as its duties and responsibilities the evaluation of health care rendered in long-term care and geriatric facilities, geriatric rehabilitation facilities, and home health care services; development of fundamental principles involved in seeing that quality health services are provided in such facilities, and by outpatient and home health care service providers; serve in an advisory capacity to ensure that the goals established by the subcommittee are being met in all such facilities; work with those governmental and other agencies which are involved in the provision and delivery of long-term care and geriatrics services; develop and seek funding for any research projects that might improve the quality of such long-term care and geriatrics services; develop interaction of the various professional and nonprofessional groups concerned with long-term care and geriatrics, preparing and presenting educational programs to acquaint the profession, the public and others with problems relating to services in such institutions and to integrate these services into the total health care system.

Amend Article XI, Section 28 (Committee on Public Health) by inserting the following new subsection (g):

(g) **Subcommittee on Maternal Health and Welfare** - A subcommittee of at least five members shall report to the Committee on Public Health on all issues involving maternal health including maternal morbidity and mortality, evolution of all perinatal deaths, and the review of policies and procedures that have impact upon maternal morbidity and mortality.

Amend Article XI, Section 20 (Committee on Mental Health), by striking it in its entirety and inserting the following new section as subsection (h) of the Committee on Public Health:

(h) **Subcommittee on Mental Health** - A subcommittee of at least five members shall investigate, consider and advise upon all areas of emotional and mental health and maintain closeliaison with the areas of mental retardation and substance abuse.

Amend Article XI, Section 22 (Occupational Health Committee), by striking it in its entirety and inserting the following new section as subsection (i) of the Committee on Public Health:

(i) **Subcommittee on Occupational Health** - A subcommittee of at least five members shall study and report as it deems advisable upon all phases of occupational health including the working environment. It shall consider such subjects as occupational health problems in industry; and the quality and health environment in industry as it affects the working person. It shall also monitor the activities of the Workers Compensation Commission to include reimbursement policies and procedures, disability determination criteria and all other areas. It shall establish liaison with the health care practitioner to discuss areas of mutual concern; and it shall advise all physicians with respect to employee absenteeism, the proper use of work absence certificates, return to work authorizations, appropriate use of health insurance benefits, and any other related areas.

Amend Article XI, Section 28 (Committee on Public Health), by inserting the following new subsection (j):

(j) **Subcommittee on Sports Medicine** - A subcommittee of at least five members shall report to the Committee on Public Health on all matters involving sports medicine at the state and national level.

AMA-ERF Checks

Checks in the amount of $18,215 in unrestricted funds and $4,324 in restricted funds were presented to Dr. David Blake, Associate Dean for Administration and Planning of The Johns Hopkins University, School of Medicine; $2,007 in unrestricted funds and $102 in restricted funds were presented to Col. Richard McDonald MD, Assistant Dean for Student Affairs of the Uniformed Services University of the Health Sciences; and $30,146 in unrestricted funds and $6,931 in restricted funds were presented to Dr. James Hudson, Associate Dean for Academic Administration of the University of Maryland, School of Medicine.

Mrs. Elizabeth Linhardt, Chairman of the AMA-ERF in Maryland, and Mrs. Eva Edmonds, President of the Med Chi Auxiliary, participated in the presentation.

A.H. Robins Award

The President presented the A. H. Robins Award for Community Service to Dr. Hiroshi Nakazawa for his outstanding contributions to the community, the state, the country and the world, for his commitment to the delivery of quality health care, and for his dedication to the profession of medicine.

Certificates of Appreciation

The President presented Certificates of Appreciation to the following physicians for their outstanding service and dedication as chairmen of their respective committees:

Dr. Victor Hrehorovich, Chairman
Committee on Hospital Medical Staffs
Dr. Louis C. Breschi, Chairman
Committee on Professional Ethics
Dr. Emidio A. Bianco, Chairman
Peer Review Committee

Photo Contest

The President announced the winners of the Photo Contest:

Color - lst and 2nd Place: Dr. Jerrold Post
Black-and-White - lst Place: Dr. David Paul
2nd Place: Dr. Irvin Washman

Awards to Faculty - Thoracic Society

On behalf of Dr. James P.G. Flynn, Ms. Thelma Rector of the Maryland Chapter of the Maryland Thoracic Society, presented an award to the Faculty in recognition of Med Chi's continued support toward improving health in the fight against lung disease through education and smoking prevention.

Maryland National Guard

A Certificate of Appreciation was presented to Med Chi by Brig. Gen. Tom Baker, on behalf of the Maryland Army National Guard, in recognition of Med Chi's support of the Maryland Guard in its efforts to recruit medical professionals.

Dr. Hiroshi Nakazawa is presented with the A. H. Robins Award by President Dobridge.

Nominating Committee Report

Dr. Leon Kassel, Immediate Past-President and Chairman of the Nominating Committee, on behalf of the Nominating Committee, presented the following slate of officers to the House of Delegates:

President-elect (1989-90)
Reynaldo L. Lee-Llacer, Prince George's County (President, 1990-91)

First Vice-President (1990)
Marvin Schneider, Wheaton, Montgomery County

Second Vice-President (1990)
Bahram Erfan, Riverdale, Prince George's County

Third Vice-President (1990)
Alex Azar, Salisbury, Wicomico County

Secretary (1990)
Harold B. Bob, Baltimore, Baltimore County

Treasurer (1990)
Jose M. Yosuico, Baltimore, Baltimore City

Committee on Scientific Activity (1990-1996)
John H. Mulholland, Baltimore, Baltimore City

Finney Fund Committee (1990-1995)
Theodore E. Woodward, Baltimore, Baltimore City

Delegates to the AMA
Albert M. Antlitz, Baltimore, Baltimore City (January 1, 1990-December 31, 1992)
Roland T. Smoot, Baltimore, Baltimore City (January 1, 1990-December 31, 1992)
Joseph Snyder, Silver Spring, Montgomery County (January 1, 1989-December 31, 1991)

Alternate Delegates to the AMA
Barry E. Epstein, Baltimore, Baltimore City (Resident) (January 1, 1990-December 31, 1992)
Daniel P. Paoli, Baltimore, Baltimore City (Student) (January 1, 1990-December 31, 1992)
Raymond M. Atkins, Baltimore, Baltimore City (January 1, 1989-December 31, 1991)
J. David Nagel, Lutherville, Baltimore County (1989 Annual Meeting-December 31, 1990)

Board of Physician Quality Assurance
(4 year term, 6/30/89-6/30/93) - (Faculty Bylaws require that a minimum of twice the number of nominees shall be submitted as there are seats to be filled.)

R. Marshall Ackerman (ORS), Rockville, Montgomery County
Ira N. Brecher (GS), Silver Spring, Montgomery County
Lawrence A. Jones (U), Hagerstown, Washington County
David P. Largey (GS), Salisbury, Wicomico County
Lorenzo Marcolin (ORS), Rockville, Montgomery County

Dr. Kassel announced that Dr. Mulholland had withdrawn his nomination to the Committee on Scientific Activity, thereby leaving a vacancy to be filled.

The floor was opened to further nominations for these offices.

Dr. Gershon Efron, Baltimore City, was nominated from the floor for the position on the Committee on Scientific Activity, following which the nominations were declared closed by general consent.

The President announced that the election for the various positions would take place as the first item of business on Friday, April 14, 1989 at 2 p.m.

Resolution

Dr. Robert Ruderman, on behalf of the Prince George's County Medical Society, requested to introduce a resolution proposing the formation of a Maryland Healthcare Delivery Alliance which, by a 2/3 vote of the House, was deferred for discussion at the meeting of the House on Friday, April 14.

The meeting was adjourned at 12:45 p.m.

HAROLD B. BOB MD, Secretary

Gary L. Rosenberg
Aubrey C. Smoot
Roland T. Smoot
Joseph Snyder
Jose M. Yosuico

Also present were members of the Faculty staff.

J.D. Drinkard
1931-1989

The President called for a moment of silence in respect for Dr. J. D. Drinkard, Past President of the Faculty, who died on Thursday, April 13, 1989 in Lynchburg, Virginia.

Guests

The President introduced the following guests who were in attendance:

Dr. J. Thomas Hulvey, President Medical Society of Virginia

Judge Edgar P. Silver, former Judge of Supreme Bench of Baltimore

Election of Officers

There being only one candidate for each office to be filled, by unanimous consent, the ballot was dispensed with and the following were elected by voice vote:

President-elect (1989-1990)
Reynaldo L. Lee-Llacer, Clinton, Prince George's County
(President 1990-1991)

First Vice-President (1990)
Marvin Schneider, Wheaton, Montgomery County

Second Vice-President (1990)
Bahram Erfan, Riverdale, Prince George's County

Third Vice-President (1990)
Alex Azar, Salisbury, Wicomico County

Secretary (1990)
Harold B. Bob, Baltimore, Baltimore County

Treasurer (1990)
Jose M. Yosuico, Baltimore, Baltimore City

Committee on Scientific Activity (1990-1996)
Gershon Efron, Baltimore, Baltimore City

Finney Fund Committee (1990-1995)
Theodore E. Woodward, Baltimore, Baltimore City

Delegates to the AMA
Albert M. Antlitz, Baltimore, Baltimore City
(January 1, 1990-December 31, 1992)
Roland T. Smoot, Baltimore, Baltimore City
(January 1, 1990-December 31, 1992)
Joseph Snyder, Silver Spring, Montgomery County
(January 1, 1989-December 31, 1991)

Alternate Delegates to the AMA
Barry E. Epstein, Baltimore, Baltimore City
(Resident) (January 1, 1990-December 31, 1992)
Daniel P. Paoli, Baltimore, Baltimore City
(Student) (January 1, 1990-December 31, 1992)
Raymond M. Atkins, Baltimore, Baltimore City
(January 1, 1989-December 31, 1991)
J. David Nagel, Lutherville, Baltimore County
(1989 Annual Meeting-December 31, 1990)

Board of Physician Quality Assurance
(Nominees to be submitted.)

R. Marshall Ackerman (ORS), Rockville, Montgomery County
Ira N. Brecher (GS), Silver Spring, Montgomery County
Lawrence A. Jones (U), Hagerstown, Washington County
David P. Largey (GS), Salisbury, Wicomico County
Lorenzo Marcolin (ORS), Rockville, Montgomery County

Maryland's Mary Strauss, 1988-89 AMA President, delivers her farewell address to Med Chi's House of Delegates.

AMA Alternate Delegate Elected

By unanimous consent, nominations were reopened to fill the vacancy created by the election of Dr. *Joseph Snyder* (former Alternate Delegate) to the position of Delegate to the AMA. Dr. Reynaldo Lee-Llacer was nominated from the floor and elected unanimously to the position of AMA Alternate Delegate for the term commencing with the 1989 Annual Meeting through December 31, 1991.

Awards Presented

The President presented awards to Senator Paula Hollinger and Delegate Donna Felling for addressing the nursing crisis in Maryland in the legislature.

AMA Auxiliary Report

Mrs. Mary Strauss, President of the AMA Auxiliary, presented a report on the activities of the auxiliary during the past year.

Med Chi Auxiliary Report

Mrs. Eva Edmonds, Auxiliary President, made a report to the House of Delegates which will be published in the annual reports in the August 1989 issue of the *Maryland Medical Journal.*

MMPAC Report

Dr. Harold B. Bob, Chairman of the Maryland Medical Political Action Committee, made a report to the House of Delegates. This report will be included in the annual reports published in the August 1989 issue of the *Maryland Medical Journal.*

Reference Committee Report

Dr. Aubrey C. Smoot, Chairman of the Reference Committee, on behalf of the Reference Committee, recommended adoption of the following resolution, which was adopted unanimously:

Resolution 1A/89 - Student and Resident Participation - ADOPTED

Whereas, The Medical and Chirurgical Faculty of Maryland was among the first state medical societies to establish Student and Resident Component Medical Societies;
Whereas, The Medical and Chirurgical Faculty of Maryland has continued to encourage its student and resident members to participate in its activities including the Council and House of Delegates; and
Whereas, Student and Resident Component Societies will continue to provide new membership vital to a dynamic, growing medical society; therefore be it
RESOLVED, That the Medical and Chirurgical Faculty of

Maryland continue to involve its student and resident members in appropriate levels of Faculty activities.

Dr. Smoot, on behalf of the Reference Committee, recommended adoption of the following resolution, which was adopted unanimously:

Resolution 2A/89 - Natural Sciences Ambassador Project - ADOPTED

Whereas, The technology and sophistication of modern medicine has evolved through advancements in the various disciplines of the natural sciences;
Whereas, The continued stature of American medicine and technology relies upon the achievements of scientists both present and future;
Whereas, In a recent evaluation of science aptitude, American 17 years old placed near the bottom of a 17 country comparison;
Whereas, 50 percent of Japanese scientists and engineers are under the age of 35, while only 28percent of their American counterparts are of such age;
Whereas, The classroom can be a vehicle bywhich to captivate a student's attentions and imagination; and
Whereas, The American Medical Association is developing a project introducing scientist "Ambassadors" into classrooms for the purpose of student enlightenment, with the intention of stimulating interest toward concerns in the Natural Sciences; therefore be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland establish a Natural Sciences Ambassador Project; and be it further
RESOLVED, That project coordination be accomplished through the voluntary involvement of Component Medical Societies with their respective Boards of Education.

Dr. Smoot, on behalf of the Reference Committee, recommended adoption of the following resolution, which was adopted unanimously:

Resolution 3A/89 - Ophthalmic Surgical Care - ADOPTED

Whereas, A surgeon's obligations to a patient do not end with the conclusion of an operation;
Whereas, This physician-patient relationship, unless appropriately terminated by one or both of the parties, continues until ended by the cessation of the medical necessity which gave rise to the relationship;
Whereas, The management of post-ophthalmic surgical care constitutes the practice of medicine and cannot be managed by other health care practitioners;
Whereas, Post-ophthalmic surgical care is inseparable from the entire surgical process as it involves monitoring the recovery process, detecting and diagnosing conditions arising during the recovery process, and taking steps to treat postsurgical problems;
Whereas, Ophthalmologists, because of their unique competence to diagnose and treat post-operative ocular pathologic conditions, are the only health care professionals who are fully educated and trained to manage and provide postoperative medical eye care;
Whereas, The American Academy of Ophthalmology feels that the provision of postoperative care by nonphysicians represents patient abandonment and is certainly not in the best interest of the patient; and
Whereas, The Maryland Board of Medical Examiners in July 1986 has affirmed that the rendering of postoperative care isthe practice of medicine and cannot be legally delegated; therefore be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland asserts that, in keeping with the sound professional practice of medicine, the provision of postoperative medical eye care is the responsibility of the ophthalmologist and can be neither legally nor ethically delegated to a nonphysician.

Dr. Smoot, on behalf of the Reference Committee, recommended adoption of the following resolution, which was adopted by unanimous vote:

Resolution 4A/89 - Women Physicians in Organized Medicine - ADOPTED

Whereas, The professional expertise, skills and leadership of women are important to the future of organized medicine;
Whereas, Women are entering the medical field in increasing numbers; and
Whereas, Women physicians have made outstanding contributions to the fields of research and development and clinical medicine; therefore, be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland in cooperation with its component societies, actively recruit women members; and be it further,
RESOLVED, That the Medical and Chirurgical Faculty of Maryland encourage women physicians to actively participate in organized medicine through increased committee and other leadership involvement.

Dr. Robert Ruderman, on behalf of Prince George's County Medical Society, moved adoption of the following resolution. After debate, a motion was adopted to refer the resolution to the appropriate committee of the Faculty for study and report back to the House of Delegates at its 1989 Semiannual Meeting:

Late Resolution 5A/89 - REFERRED

Whereas, There are major forces in the delivery of health care in Maryland which are denying the patient the right to free choice;
Whereas, The Federal Government has expanded its role in health care delivery by expanding the interpretations of the intent of the laws without benefit of consultation with those delivering the care; and
Whereas, A steady decline in the quality of health care adversely affecting eligible Medicare enrollees is anticipated,

Outgoing President Michael R. Dobridge MD leads Med Chi's new President, Raymond M. Atkins in the oath of office.

while the costs are being caused to rise due to increasing administrative expenditures; therefore, be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland cause to be established a Maryland Health Care Delivery Alliance consisting of the Faculty, the Maryland Hospital Association, the Maryland Nursing Association, and other statewide professional associations, in order to act as a unified voice which would have greater effect than the individual groups themselves.

Oath of Office - Exchange of Gavel

Dr. Dobridge, President, briefly addressed the House, administered the Oath of Office to Dr. Raymond M. Atkins, the incoming President, presented Dr. Atkins with the President's Medallion, and the exchange of the gavel took place. Dr. Atkins then presented the Past-President's Medallion to Dr. Dobridge and proceeded to address the House.

By unanimous consent, the President declared the meeting adjourned sine die at 3:30 p.m.

HAROLD B. BOB MD, Secretary

Dr. Atkins is congratulated by his wife, Julie.

Dr. Raymond M. Atkins receives the President's Medal.

Intercessory Prayer

Two researchers are studying the effects of intercessory prayer and are interested in hearing from anyone who has conducted similar work. Anyone who has carried out such a study but has never published the results is requested to contact either of the below listed professors. If you have not personally been involved in such a study but know people who have, please share their names and addresses with:

Prof. Michael Zimmerman (216-775-8517 or 8315)

PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $5 million for individual doctors and $7.5 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

Ad hoc Women in Medicine

Mr. President and Members of the House of Delegates:

The Ad Hoc Committee on Women In Medicine was formed in January 1989 to focus on issues facing women physicians relating to both their professional and personal goals and to develop programs to improve the opportunity for women in medicine to attain the goals.

At present, the primary goal of this committee is to increase women's membership in Med Chi and encourage women physicians to become actively involved in organized medicine at all levels (county, state, and national). The Committee formulated a resolution, passed by the House of Delegates in April 1989, that Med Chi "actively recruit women members" and the Faculty "encourage women to actively participate in organized medicine through increased committee and other leadership involvement."

To carry out this resolution, the Committee is sending letters and Med Chi membership brochures to nonmember women physicians in Maryland encouraging them to participate in organized medicine. In September 1989, the Committee will celebrate "Women in Medicine Month." During this month, women physicians in Maryland will be invited to participate in a meeting to discuss problems that may be unique to women physicians and to determine how organized medicine can help solve them.

To increase the participation of Med Chi's women members, each member of the Women in Medicine Committee was asked to volunteer to serve on another Med Chi Committee that lacks women representatives. In 1988, nine Med Chi committees lacked women representatives; in 1989, the Women in Medicine Committee hopes to reduce this number.

Another major goal of the Women in Medicine Committee is to increase the availability of child care facilities for working women. The Committee is formulating solutions for a new type of child care that will be convenient, safe, flexible, readily available, and close to the workplace so parents may spend more time with their children to the benefit of the parents, their children, and their profession.

Other goals of the Committee may include support and social groups for women physicians, seminars to help women function with job/family stress, and a roundtable discussion of women physicians and medical students to discuss various women's issues perceived to be unique to working women.

The members of the Women in Medicine Committee thank Med Chi for the opportunity of serving on this committee. We welcome any comments or suggestions for future activities from all physicians. In this exciting and changing medical atmosphere, we physicians must work together, cooperating for the excellence of our profession now and in the future.

AIDS

Mr. President and Members of the House of Delegates:

The Committee on AIDS met six times between September 1988 and May 1989.

Over the last 12 months, a number of AIDS issues have surfaced. Educating and teaching children about this disease has been a major goal. The Committee was instrumental in implementation of such education into the schools (public, private, and parochial) by the Department of Health and Mental Hygiene, while the committee concentrated on educating physicians in Maryland.

Meetings have been held with the chairman and members of the Faculty's Ethics Committee to assist in providing ethical opinions for physicians in the treatment of AIDS patients. Our position is identical to that of the AMA.

Auxiliary Past Presidents after the Gavel Club luncheon meeting at Turf Valley.

A great deal of legislation related to AIDS issues was introduced during the 1989 General Assembly. Opinions of the Committee were transmitted to the Faculty's Legislative Committee and the Governor's Advisory Council on AIDS.

The Committee cosponsored a scientific session with the Center for Health Education Inc. at the 1989 Annual Meeting of Med Chi, "AIDS, How Will It Affect Your Practice?" and the response was overwhelming. The Committee also sponsored an educational booth on AIDS and distributed pamphlets provided by the Department of Health and Mental Hygiene. Committee members volunteered their time to staff the booth and to respond to questions raised by physicians.

Membership of this Committee consists of physician-members of Med-Chi and representatives from local and state health departments, the Health Education Resource Organization (HERO), and the Center for Health Education. The Committee looks forward to the coming year and will strive to provide appropriate education both to the physicians and the public. The Chairman has appreciated the dedication of the committee members and the Faculty staff.

Alcoholism and Chemical Dependency

Mr. President and Members of the House of Delegates:

The Committee on Alcoholism and Chemical Dependency continued its efforts toward raising awareness concerning the dangers of alcohol and drug abuse and smoking.

The Committee began the year by meeting with representatives from Mothers Against Drunk Driving and the Alcoholism and Drug Abuse Administration of the Department of Health and Mental Hygiene of the State of Maryland. After learning more about these organizations, members developed a proposal concerning an individual's responsibility for behavior while under the influence of alcohol. The proposal was approved by the Committee at its last meeting and is being considered for presentation to Med Chi's Council.

The Committee presented a resolution to the Council limiting the sale of tobacco products in Maryland by raising the minimum age required for the purchase of tobacco products and restricting the means by which tobacco products may be dispensed. This resolution was approved by the Council. During the past year other resolutions developed by the Committee on Alcoholism and Chemical Dependency and being considered for presentation to the Council include banning the US exportation of tobacco products, banning the sale and use of tobacco products in Maryland hospitals and the voluntary banning of the use of tobacco products in physicians' offices. All resolutions were aimed at reducing the use of tobacco products.

The Committee also co-sponsored a presentation, with the Maryland Psychiatric Society and American Academy of Family Physicians, entitled "The Pen Is Mightier than the Sword - Prescription Drug Abuse" at Med-Chi's Annual Meeting. The presentation was well received and consideration is being given to offering this presentation to component societies of the Faculty.

The Committee continues to work diligently to address a wide range of concerns about alcohol and chemical abuse. I thank the Faculty, the Committee members, and our staff for their assistance and support during the past year.

AMA-ERF

Mr. President and Members of the House of Delegates:

It is my privilege as State Chairman AMA-ERF to submit the final report of Faculty Members' contributions to AMA-ERF for the fiscal year June 1, 1988 through May 31, 1989. While we did not reach our goal of $67,000 by roughly $7,000, we are indeed grateful for the loyal, generous support of **all** Faculty members whose contributions, coupled with fund-raising efforts of Auxilians, realized a final state total of $59,801.

With sincere gratitude we recognize the support of the following county medical societies who participated in our State Board "Holiday Sharing Card" project:

Allegany County Medical Society
Anne Arundel County Medical Society
Baltimore City Medical Society
Howard County Medical Society
Montgomery County Medical Society

Realizing what we have done in AMA-ERF could be of major significance, what we must do is even more important. In today's world the continuing rapid advance in technology and the ever-increasing discovery of new diseases emphasize the extreme need to increase support to our medical schools and the new generation of tomorrow's physicians. *This is our medical family obligation.*

Faculty Contributions
June 1, 1988 - May 31, 1989

Allegany County	$ 590
Anne Arundel County	2,105
Baltimore City	4,625
Baltimore County	3,340
Calvert County	180
Caroline County	--
Carroll County	360
Cecil County	185
Charles County	260
Dorchester County	100
Frederick County	380
Garrett County	40
Harford County	820
Howard County	985
Kent County	100
Montgomery County	6,875
Prince George's County	2,743
Queen Anne's County	20
St. Mary's County	60
Somerset County	20
Talbot County	700
Washington County	1,080
Wicomico County	940
Worcester county	20
Total	$26,528

Maryland Physicians' Direct Contributions
June 1, 1988 - April 30, 1989
$8,359

Elizabeth A. Linhardt, State Chairperson

Auxiliary

Mr. President and Members of the House of Delegates:

Visibility of our State Auxiliary and recognition for our work has dominated the 1988-89 Fortieth Anniversary Year. This is a federated visibility seen on the national, state, and county level.

On the national level, we have been proud and honored that Mary Strauss (Mrs. Albert J., Jr.) has been the first AMA Auxiliary President from Maryland.

On the state level, we have had an impact on legislation. In November the Auxiliary, Med Chi, Maryland Medical Political Action Committee, and specialty societies jointly participated in "Docs for Don." This was a breakfast meeting with Governor William Schaefer, who is a friend of medicine.

January 31 was Auxiliary Day in Annapolis. Vicki Cameron, State President-Elect; Josie Figueroa, Nominated State President-Elect; Dan Divito, Legislation Chairman; Mary Skipton, Past State President and Legislative Chair; and I stood on the dais in the Maryland Senate chambers and proudly received from Mike Miller, President of the Senate, a Resolution to our Auxiliary "In Recognition of Contributions in Health, Education and the Promotion of Quality Health Care."

The Sixth Annual Multi-State Meeting with other state Auxiliary leaders (Virginia, West Virginia, DC, Maryland) was held in March in Washington. After a briefing from AMA, we traveled to Capitol Hill to contact our individual legislators.

On the county level, our projects and accomplishments are varied, but they have an impact on their respective communities. A sampling of projects includes: AIDS Education Seminar, Senior Citizen programs and overseeing a senior center, organizing a holiday sharing for the poor, helping to raise funds for shelters for the homeless, giving away car seats, adopting needy families during special holidays, bringing valentine cheer to residents of a nursing home, volun-

Participants after the prayer breakfast from left:
Dr. Wells, Dr. Miles, Anne Neale PhD, Dr. Atkins

teering for a prison health fair, presenting pediatric units of hospitals with Organ Annie dolls, and presenting an ongoing joint program with a county medical society using Organ Annie in the elementary classroom. We have been visible throughout our state.

These accomplishments and commitments of our component Auxiliaries are varied, but they have had a tremendous impact on our communities and thus our state as a whole.

The State Auxiliary is proud of its 40 years of rich and varied history.

Eva M. Edmonds, President 1988-89

Bylaws

Mr. President and Members of the House of Delegates:

The Bylaws Committee recommends the following bylaw amendments to the House of Delegates for its consideration:

1. Proposed Bylaw Amendment to Provide Voting Privileges for Emeritus Members in the Council

- Rationale: In accordance with Council action of September 24, 1988, Emeritus Members elected to Council by their respective component societies shall have voting privileges in the Council.
- Amend Article II, Section 5 (Emeritus Members) following the words "They shall have the rights accruing to associate members," by inserting the words, "and they shall have the right to serve on the Council with voting privileges."

OLD

[ ] indicates deletion

Section 5. *EMERITUS MEMBERS* shall consist of those members who, upon the request of their component societies and recommendation by the Council, shall be so designated by majority vote of the House of Delegates. They shall be (1) members no longer engaged in the practice of medicine, either in private practice, public health, administration, teaching or any activity where their knowledge of medicine earns them an income; or (2) members whose health is such that their ability to carry on active practice has become greatly limited. The Council, of its own motion and without the request of a component society, may recommend to the House of Delegates for active practice has become greatly limited. The Council, of its own motion and without the request of a component society, may recommend to the House of Delegates for Emeritus Membership any affiliate member under the provisions of Article II, Section 3 (2), provided they meet all of the requirements of this section. They shall have the rights accruing to associate members. They shall not be entitled to physician's defense unless the alleged malpractice occurred during their tenure as active members.

NEW

CAPS indicate change

Section 5. *EMERITUS MEMBERS* shall consist of those members who, upon the request of their component societies and recommendation by the Council, shall be so designated by majority vote of the House of Delegates. They shall be (1) members no longer engaged in the practice of medicine, either in private practice, public health, administration, teaching or any activity where their knowledge of medicine earns them an income; or (2) members whose health is such that their ability to carry on active practice has become greatly limited. The Council, of its own motion and without the request of a component society, may recommend to the House of Delegates for Emeritus Membership any affiliate member under the provisions of Article II, Section 3 (2), provided they meet all of the requirements of this section. They shall have the rights accruing to associate members AND THEY SHALL HAVE THE RIGHT TO SERVE ON THE COUNCIL WITH VOTING PRIVILEGES. They shall not be entitled to physician's defense unless the alleged malpractice occurred during their tenure as active members.

The Bylaws Committee recommends adoption of this bylaw amendment.

2. Proposed Bylaw Amendment to Establish a Committee on Specialty Societies

- Rationale: In accordance with recommendation of Ad Hoc Role Relationship Committee adopted by Council on January 28, 1989, to provide representation of specialty societies within the Faculty.
- Amend Article XI (Committees) by inserting the following new Section 35, subsequent sections automatically being redesignated:

Section 35. A *COMMITTEE ON SPECIALTY SOCIETIES* composed of representatives of Maryland specialty societies (as identified by the Council) shall be appointed annually by the Faculty President, who shall also appoint the Chairman. Each specialty society shall be authorized one designee and an alternate, who shall be members of Med Chi. The committee shall review issues concerning inter-disciplinary and multi-disciplinary problem areas of medical practice as they relate to each specialty. The Committee shall present issues to the Council for adoption, thereby lending the full force of organized medicine within the State of Maryland to an issue which may affect only one specialty. The Committee shall select from its membership, seven delegates (and seven alternate delegates) as representatives to the Faculty's House of Delegates, and one member to serve on the Faculty's Council.

The Bylaws Committee recommends adoption of this bylaw amendment.

3. Proposed Bylaw Amendment to Clarify Council Composition

• Rationale: To include component society elected councilors and selected representative of Committee on Specialty Societies as members of Council.

o Amend Article VII (Council), Section 1 by substituting for it the following new Section 1:

OLD

[ ] indicates deletion

[Section 1. The Council shall be composed of the elective officers, the immediate past-president, the Deans of Medical Schools within Maryland and the delegates to the American Medical Association.]

NEW

CAPS indicate change

Section 1. THE COUNCIL SHALL BE COMPOSED OF THE ELECTIVE OFFICERS OF THE FACULTY, THE IMMEDIATE PAST-PRESIDENT, THE DELEGATES TO THE AMERICAN MEDICAL ASSOCIATION, THE DEANS OF MEDICAL SCHOOLS WITHIN MARYLAND, REPRESENTATIVES OF COMPONENT MEDICAL SOCIETIES, AND A REPRESENTATIVE OF THE COMMITTEE ON SPECIALTY SOCIETIES.

The Bylaws Committee recommends adoption of this bylaw amendment.

4. Proposed Bylaw Amendment to Include Members of the Committee on Specialty Societies in the House of Delegates

• Rationale: As approved by Council on January 28, 1989, the Committee on Specialty Societies shall have representation in the House of Delegates.

o 3Amend Article VI (House of Delegates), Section 5 by inserting the following new subsection (f), all subseqeunt subsections being redesignated:

OLD

[ ] indicates deletion

Section 5. *THE MEMBERS OF THE HOUSE OF DELEGATES* shall be:

(a) The members of the Council, [each of whom shall have one vote.]

(b) One member of the Board of Physician Quality Assurance elected by that body.

(c) One delegate from each chartered component society except for any component society composed exclusively of Student Members or Active Members who are on the resident staff of hospitals or holding a fellowship, and one additional delegate for each 50 Active members and Forty-year members or major fraction thereof.

(d) One alternate from each chartered component society for each delegate. Alternates shall take no part in meetings unless sitting for a delegate.

(e) One delegate from any component society composed exclusively of Student Members or Active Members who are on the resident staff of hospitals or holding a fellowship, and one additional delegate for each 500 members of such Society or major fraction thereof.

(f) All past-presidents with all rights of membership except that of voting.

NEW

CAPS indicate change

Section 5. *THE MEMBERS OF THE HOUSE OF DELEGATES,* EACH OF WHOM SHALL HAVE ONE VOTE (PAST-PRESIDENTS EXCEPTED), SHALL CONSIST OF:

(a) The members of the Council.

(b) One member of the Board of Physician Quality Assurance elected by that body.

(c) One delegate from each chartered component society except any component society composed exclusively of Student Members or Active Members who are on the resident staff of hospitals or holding a fellowship, and one additional delegate for each 50 Active members and Forty-year members or major fraction thereof.

(d) One alternate from each chartered component society for each delegate. Alternates shall take no part in meetings unless sitting for a delegate.

(e) One delegate from any component society composed exclusively of Student Members or Active Members who are on the resident staff of hospitals or holding a fellowship, and one additional delegate for each 500 members of such Society or major fraction thereof.

(f) SEVEN DELEGATES SELECTED BY THE COMMITTEE ON SPECIALTY SOCIETIES, AND ONE ALTERNATE DELEGATE FOR EACH OF THE SEVEN DELEGATES. ALTERNATE DELEGATES SHALL TAKE NO PART IN MEETINGS UNLESS SITTING FOR A DELEGATE. DELEGATES AND ALTERNATE DELEGATES SHALL SERVE FOR A TERM OF ONE YEAR.

(g) All past-presidents with all rights of membership except that of voting.

The Bylaws Committee recommends adoption of this bylaw amendment.

5. Proposed Bylaw Amendment to include Vice Presidents as members of the Executive Committee

• Rationale: To broaden representation in the Executive Committee to include Faculty Vice Presidents as members of the Executive Committee, thereby increasing the number of Executive Committee members from 7 to 10, and providing a more geographical representation and participation in Executive Committee activities. Vice Presidents are selected from different Nominating Committee groups, each of which represents a different area of the state (ref. Art. IV, Sect. 4, Faculty Bylaws). If adopted, a change in the Executive Committee quorum from 3 to 4 is necessary.

MRI UPDATE

Figure 1

Figure 2

Figure 3

CLINICAL INFORMATION: Non-meniscal abnormalities are commonly suspected and evaluated by MRI and unexpected non-meniscal abnormalities are commonly demonstrated in the course of MR evaluation for internal derangements of the knee.

FINDINGS: Figure 1 is a sagittal image through the lateral compartment of a 15-year-old patient's knee. The subarticular portion of the lateral femoral condyle is affected by low signal alteration containing three rounded areas of higher signal intensity. The findings here are diagnostic of osteochondritis dessicans (straight arrows). Notice the normal adjacent anterior and posterior horns of the lateral meniscus (curved arrows).

Figure 2 is a sagittal image through the intercondylar midportion of a 19-year-old patient's knee. The tibial insertion of the anterior cruciate ligament is indicated by the arrow. The remainder of the anterior cruciate ligament is totally disrupted and its expected position is occupied by inhomogeneous material of intermediate signal intensity compatible with hemorrhage. The anterior cruciate has been notoriously difficult to evaluate by MRI, but its reliable evaluation is now possible with careful positioning and rescanning of questionable cases.

Figure 3 is a coronal image of the posterior aspect of the knee of a 33-year-old patient. The arrow indicates a 1.5 cm. ganglion cyst intimately applied to the lateral aspect of the biceps femoris tendon just proximal to the fibular head. The MR study clearly demonstrates the extra-articular and extraosseous nature of this process.

COMMENT: MRI has become clearly established for evaluation of internal derangements of the knee. Meniscal evaluation is known to be highly accurate. The cases shown here are meant to demonstrate the efficacy and accuracy of MR evaluation of extrameniscal structures.

Section 1. The Executive Committee shall consist of the President, the President-Elect, the Immediate Past-President, THE FIRST, SECOND AND THIRD VICE PRESIDENTS, the Secretary, the Treasurer and the Chairman and Vice-Chairman of the Council.

The Bylaws Committee recommends adoption of this bylaw amendment.

• Amend Article VIII (Executive Committee), Section 3, in the last sentence, following the words "A quorum of the Executive Committee shall be..." by striking the word "three" and inserting the word "four..."

OLD
[indicates deletion]

Section 3. The Executive Committee shall meet at the call of the Chairman of the Council or two of its members. The Chairman of the Council shall be Chairman. *A quorum of the Executive Committee* shall be [three] of its members.

NEW
CAPS indicate change

Section 3. The Executive Committee shall meet at the call of the chairman of the Council or two of its members. The Chairman of the Council shall be Chairman. *A quorum of the Executive Committee* shall be FOUR of its members.

The Bylaws Committee recommends adoption of this bylaw amendment.

6. Proposed Bylaw Amendment to Incorporate into Committee Function Activities Involving Quality Assurance, Risk Management, Model Hospital Medical Staff Bylaws, and Consultation with Outside Organization

• Rationale: In accordance with Council action of November 19, 1988, authorizing Committee on Hospital Medical Staffs to broaden its activities as indicated above. Also, to streamline Committee appointments to better involve Delegates to the American Medical Association Hospital Medical Staff Section and physicians with experience and expertise in hospital based quality assurance.

• Amend Article XI, Section 12 (Committee on Hospital Medical Staffs) by substituting for it the following:

OLD
[ ] indicates deletion

[Section 12. A *COMMITTEE ON HOSPITAL MEDICAL STAFFS*, approximately one-third of the members of which shall be chosen for a term of three years, shall annually be elected by the hospital medical staff of each hospital within the State of Maryland, preferably from among members of the American Medical Association. No such hospital medical staff shall be represented by more than one member. The President of the Faculty may also appoint three members-at-large, and he shall designate the member of the committee who shall serve as chairman. The duties of the committee shall be to provide a direct means of addressing the relationship between members of the Faculty and hospital staffs. The committee shall work with and

Reception line preceding Med Chi's Presidential Banquet. Preparing to greet banquet attendees are (L to R) Dr. Raymond M. Atkins (Incoming President), Ann Wintriss, Dr. Leon E. Kassel (Immediate Past President), Jane Dobridge, Dr. Michael R. Dobridge (President 1988-89). The Dobridge children wait in foreground.

coordinate activities with the Hospital Medical Staff Section of the American Medical Association.]

NEW
CAPS indicate change

SECTION 12. A *COMMITTEE ON HOSPITAL MEDICAL STAFFS* SHALL BE APPOINTED BY THE PRESIDENT FROM A LIST OF MED-CHI MEMBERS PROVIDED BY EACH HOSPITAL MEDICAL STAFF WHO ARE EITHER DESIGNATED AS DELEGATES TO THE AMERICAN MEDICAL ASSOCIATION HOSPITAL MEDICAL STAFF SECTION; AND/OR WHO HAVE INVOLVEMENT AND EXPERTISE IN HOSPITAL QUALITY ASSURANCE ACTIVITIES. ITS CHAIRMAN SHALL BE APPOINTED BY THE PRESIDENT. THE COMMITTEE SHALL CONSULT WITH THE DEPARTMENT OF HEALTH AND MENTAL HYGIENE, MEDICAL STAFFS, PROFESSIONAL LIABILITY INSURERS AND THE MARYLAND HOSPITAL ASSOCIATION REGARDING QUALITY ASSURANCE PROGRAMS, RISK MANAGEMENT PROGRAMS, COMPLAINT INVESTIGATION, AND ANY OTHER MATTERS CONCERNING THE ESTABLISHMENT OF MEDICAL STANDARDS IN HOSPITALS. THE COMMITTEE SHALL ALSO MONITOR LEGAL ISSUES INCLUDING HOSPITAL MEDICAL STAFF BYLAWS ON THE LOCAL, STATE AND FEDERAL LEVELS. THE COMMITTEE SHALL WORK WITH AND COORDINATE ACTIVITIES WITH THE HOSPITAL MEDICAL STAFF SECTION OF THE AMERICAN MEDICAL ASSOCIATION.

The Bylaws Committee recommends adoption of this bylaw amendment.

7. Proposed Bylaw Amendment to Liaison Committee with Third Party Carriers

- Rationale: To broaden the committee's involvement to include health maintenance organizations and other managed systems of health care delivery.
- Amend Article XI, Section 13 (Liaison Committee with Third Party Carriers) by substituting for it the following new Section 13:

OLD
[ ] indicates deletion

[Section 13. A *LIAISON COMMITTEE WITH THIRD PARTY CARRIERS* of at least two members shall be appointed by the President, who shall designate the Chairman. Its charge shall be to seek resolution of problems and complaints raised by physicians regarding arbitrary, impractical, unreasonable, or unpleasant practices and procedures of third party carriers. This charge does not include the liaison currently engaged in by the Liaison Committee with the Department of Health and Mental Hygiene (the Medicaid Program). The Committee shall not attempt to adjudicate individual physician fees or charges, and is not empowered to discuss fee schedules or other matters that would involve illegal action under State or Federal antitrust regulations.]

NEW
CAPS indicate change

Section 13. A *COMMITTEE ON MANAGED CARE AND THIRD PARTY LIAISON* CONSISTING OF NOT LESS THAN (7) MEMBERS SHALL BE APPOINTED BY THE PRESIDENT, WHO SHALL DESIGNATE THE CHAIRMAN. ITS CHARGE SHALL BE TO MONITOR DEVELOPMENTS INVOLVING MANAGED SYSTEMS OF HEALTH CARE DELIVERY AT THE LOCAL, STATE AND NATIONAL LEVELS. IT SHALL SEEK RESOLUTION TO PROBLEMS AND COMPLAINTS RAISED BY PHYSICIANS INVOLVING HEALTH CARE MAINTENANCE ORGANIZATIONS REGARDING QUALITY OF CARE AND PATIENT DISPOSITION IN THE HOSPITAL OR PRIVATE SETTING. IT SHALL ALSO SEEK RESOLUTION OF PROBLEMS AND COMPLAINTS RAISED BY PHYSICIANS REGARDING ARBITRARY, IMPRACTICAL, UNREASONABLE, OR UNPLEASANT PRACTICES AND PROCEDURES OF THIRD PARTY CARRIERS. THE COMMITTEE SHALL NOT ATTEMPT TO ADJUDICATE INDIVIDUAL PHYSICIAN FEES OR CHARGES, AND IS NOT EMPOWERED TO DISCUSS FEE SCHEDULES OR OTHER MATTERS THAT WOULD INVOLVE ILLEGAL ACTIONS UNDER STATE OR FEDERAL ANTITRUST REGULATIONS. THIS CHARGE DOES NOT INCLUDE LIAISON CURRENTLY ENGAGED IN BY THE SUBCOMMITTEE ON LIAISON WITH MEDICAL ASSISTANCE PROGRAM.

The Bylaws Committee recommends adoption of this bylaw amendment.

8. Proposed Bylaw Amendment to Dissolve the Committee on Physician Assistants as recommended by Executive Committee

- Rationale: Committee has been inactive for the past four years. All issues involving paraprofessionals should be referred to appropriate Faculty committee for consideration.
- Amend Article XI, Section 24 (Committee on Physician Assistants) by striking it in its entirety.

Section 24. A *COMMITTEE ON PHYSICIAN ASSISTANTS* of at least three members shall be appointed annually by the President who shall designate the Chairman. The Maryland Academy of Physician Assistants (MAPA) shall submit names of Physician Assistants to the President for consideration as ex-officio members of this committee. At least one Physician

Assistant shall represent the MAPA Board of Directors. In addition, the Legislative Aide for MAPA shall represent it as an ex-officio member. Physician nominees shall be submitted to MAPA to the President for consideration. These physicians should currently supervise, have supervised in the past, or work or have worked in association with Physician Assistants. The committee shall have as its duty the monitoring of developments in the Physician Assistant profession at local, state and national levels and the dissemination of such information as it obtains to the House of Delegates, appropriate Faculty committees, component societies and individual members of the Faculty. The committee may make recommendations to the Faculty's governing bodies, appropriate Faculty committees and component societies.

The Bylaws Committee recommends adoption of this bylaw amendment.

9. Proposed Bylaw Amendment to Restructure the Committee on Public Health

- Rationale: To reorganize the Committee on Public Health to empower it to function as the primary committee within Med Chi to evaluate and act upon all social and economic aspects of medical care relating to public health. To accomplish this, the following committees would be redesignated as subcommittees within the auspices of the primary Committee on Public Health:

AIDS
Alcoholism and Chemical Dependency
Child and Adolescent Health and Welfare
Immunology and Infectious Diseases
Liaison with Medical Assistance Program
Long-Term Care and Geriatrics
Maternal Health and Welfare
Mental Health
Occupational Health
Sports Medicine

- Amend Article XI, Section 28 (Committee on Public Health) by substituting for it the following new Section 28:

OLD
[ ] indicates deletion

[Section 28. A *COMMITTEE ON PUBLIC HEALTH* of at least five members shall consider and advise upon all aspects of health maintenance, preventive medicine and public health. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty. Its chairman and members shall be appointed by the President.]

NEW
CAPS indicate change

Section 28. THE *COMMITTEE ON PUBLIC HEALTH* SHALL CONSIST OF A CHAIRMAN (OR TWO CO-CHAIRMEN), AND THE CHAIRMAN OF EACH SUBCOMMITTEE, ALL OF WHOM SHALL BE APPOINTED BY THE PRESIDENT. IT SHALL CONSIDER AND ADVISE UPON ALL ASPECTS OF PUBLIC HEALTH AND PREVENTIVE MEDICINE. IT SHALL MAINTAIN CONTINUOUS LIAISON WITH THE DEPARTMENT OF HEALTH AND MENTAL HYGIENE, FEDERAL AGENCIES AND WITH THE PRIVATE SECTOR. IT SHALL ACT IN AN EDUCATIONAL CAPACITY AND AS A CONSULTANT TO THESE GROUPS IN EVALUATING QUALITY OF CARE, EXPERIMENTAL PROGRAMS INVOLVING ALTERNATIVE METHODS OF HEALTH CARE DELIVERY, AND IN ANY OTHER AREA WHEREIN IMPROVEMENT OF PUBLIC HEALTH AND PREVENTIVE MEDICINE SERVICES MAY BE UNDERTAKEN. THE COMMITTEE SHALL MONITOR DEVELOPMENTS INVOLVING ALLIED HEALTH PROFESSIONALS AT LOCAL, STATE, AND NATIONAL LEVELS AND MAY MAKE RECOMMENDATIONS TO THE FACULTY'S GOVERNING BODIES. THE COMMITTEE ON PUBLIC HEALTH SHALL DIRECT AND COORDINATE THE ACTIVITIES OF ITS SUBCOMMITTEE IN AREAS OF IMMUNOLOGY AND INFECTIOUS DISEASES; AIDS; MATERNAL HEALTH AND WELFARE; CHILD AND ADOLESCENT HEALTH AND WELFARE; SPORTS MEDICINE; LONG-TERM CARE AND GERIATRICS; ALCOHOLISM AND CHEMICAL DEPENDENCY; OCCUPATIONAL HEALTH; AND MENTAL HEALTH. THROUGH ITS SUBCOMMITTEES, THE PUBLIC HEALTH COMMITTEE SHOULD HAVE THE FOLLOWING AS ITS OPERATING GOALS: ARTICLES FOR POSSIBLE PUBLICATION IN THE MARYLAND MEDICAL JOURNAL, DEVELOPMENT OF SEMINARS/CONFERENCES FOR PHYSICIAN GROUPS, AS WELL AS THE PUBLIC AT LARGE, AND THE DEVELOPMENT OF A PROGRAM TO BE PRESENTED DURING MED CHI'S ANNUAL MEETING.

- Amend Article XI, Section 1 (Committee on AIDS) by striking it in its entirety and inserting the following new section as subsection (a) of the Committee on Public Health:

OLD
[ ] indicates deletion

[Section 1. A *COMMITTEE ON AIDS* shall be appointed annually. The Chairman and members shall be appointed by the President. The committee shall work toward educating the public and the membership with respect to all aspects of AIDS. It shall review current medical treatment and policies of industry, housing, hospitals, and schools with respect to AIDS

patients, present scientific information relative to AIDS, and shall offer its services to component medical societies, hospital medical staffs, local and state health departments and school systems. The committee may cooperate with government and private agencies working in the field of AIDS and invite the attendance of physicians and non-physician members of such agencies to work with the committee on a non-voting basis.]

NEW
CAPS indicate change

(a) SUBCOMMITTEE ON AIDS - A SUBCOMMITTEE OF AT LEAST FIVE MEMBERS SHALL WORK TOWARD EDUCATING THE PUBLIC AND THE MEMBERSHIP WITH RESPECT TO ALL ASPECTS OF AIDS. IT SHALL REVIEW CURRENT MEDICAL TREATMENT AND POLICIES OF INDUSTRY, HOUSING, HOSPITALS, AND SCHOOLS WITH RESPECT TO AIDS PATIENTS, PRESENT SCIENTIFIC INFORMATION RELATIVE TO AIDS, AND SHALL OFFER ITS SERVICES TO COMPONENT MEDICAL SOCIETIES, HOSPITAL MEDICAL STAFFS, LOCAL AND STATE HEALTH DEPARTMENTS AND SCHOOL SYSTEMS. THE SUBCOMMITTEE MAY COOPERATE WITH GOVERNMENT AND PRIVATE AGENCIES WORKING IN THE FIELD OF AIDS AND INVITE THE ATTENDANCE OF PHYSICIANS AND NON-PHYSICIAN MEMBERS OF SUCH AGENCIES TO WORK WITH THE SUBCOMMITTEE ON A NON-VOTING BASIS. IT SHALL ALSO HAVE CROSS-REPRESENTATION WITH THE SUBCOMMITTEE ON IMMUNOLOGY AND INFECTIOUS DISEASES.

- Amend Article XI, Section 2 (Committee on Alcoholism and Chemical Dependency) by striking it in its entirety and inserting the following new section as subsection (b) of the Committee on Public Health:

OLD
[ ] indicates deletion

[Section 2. A *COMMITTEE ON ALCOHOLISM AND CHEMICAL DEPENDENCY* of at least five members appointed annually by the President shall work toward educating the public and the membership with respect to alcoholism and chemical dependency as illnesses; present scientific information to physicians relative to alcoholism and chemical dependency; and offer its services to hospital medical staffs in an attempt to have such members understand alcoholism and chemical dependencies. The committee may cooperate with government and private agencies working in the field of alcoholism and chemical dependency and invite the attendance of physicians and non-physician members of such agencies to work with the committee on a non-voting basis. The President shall designate the chairman.]

Computers in Medicine

Mr. President and Members of the House of Delegates:

The Computers in Medicine Committee held several meetings throughout the course of the year. The Committee maintains the Maryland Med-Sig, the computerized bulletin board system of Medical and Chirurgical Faculty. Dr. Gerald Oster has been the system operator (sysop) of Med-Sig since its inception. The Committee is involved in helping the Pennsylvania Medical Society set up a similar system, and physicians in Delaware have made similar requests. One of the Committee's goals was to provide the system as an internal Med Chi communication tool for use between committee members.

The Committee contributed articles on computers and physicians to the May 1989 issue of the *Maryland Medical Journal* and is continuing a monthly department in *MMJ*, Computer Bytes, which deals with helpful and current computer tips in the field of medicine. This is in accordance with the Committee's charge to acquaint and educate physicians in the use of computers in their practices.

The Committee has given live computer demonstrations to hospital medical staffs using a computer with a modem, phone line, and projection system.

These are potential future projects:

1. Starting a physicians' computer-user group for both novices and advanced users.
2. Evaluating medical software.
3. Providing physicians with a computer equipment-buyers group.
4. Continuing in the education of physicians using computers.
5. Promoting Med-Sig as a communication tool for physicians in Maryland.

Continuing Medical Education Review

Mr. President and Members of the House of Delegates:

The Continuing Medical Education Review Committee sponsored a session during Med Chi's 1989 Annual Meeting with speakers H. Gerald Oster MD, Director of the Med Chi Bulletin Board, and Darrell S. Rigel MD of the New York University Medical School giving a presentation, "Next Button Please - A Glimpse into Computer Assisted Teaching Techniques of the 1990s." The session format presented a unique method in medical lecture presentation and was well received by all the participants.

The Committee held six meetings during the past year. At this time, 61 hospitals and organizations are accredited by Med Chi.

Action was taken on the following hospitals/organizations that are accredited by Med Chi to provide intrastate Category I continuing medical education programs:

1. American Cancer Society, Maryland Division
2. American Heart Association, Maryland Affiliate
3. American Lung Association of Maryland
4. Anne Arundel General Hospital
5. Baltimore County General Hospital
6. Bon Secours Hospital
7. Carroll County General Hospital
8. Center for Health Education, Inc.
9. Chesnut Lodge
10. Children's Hospital, Inc.
11. Church Hospital
12. Community Psychiatric Clinic, Inc.
13. Crownsville Hospital Center
14. AMI Doctors' Hospital of Prince George's County
15. Dorchester General Hospital
16. Fallston General Hospital
17. Franklin Square Hospital
18. Frederick Memorial Hospital
19. Good Samaritan Hospital
20. Greater Baltimore Medical Center
21. Greater Laurel Beltsville Hospital
22. Harbor Hospital (formerly South Baltimore General Hospital)
23. Harford Memorial Hospital
24. Holy Cross Hospital
25. Homewood Hospital Center, Inc. (formerly North Charles Hospital)
26. Howard County General Hospital, Inc.
27. Kernan Hospital
28. Leland Memorial Hospital

29. Levindale Hebrew Geriatric Center and Hospital, Inc.
30. Liberty Medical Center

Delegation to the AMA House of Delegates - Interim Meeting

Mr. President and Members of the House of Delegates:

The AMA House of Delegates met in Dallas, December 4-7, 1988.

There were 423 delegates seated including the following new specialty society that was granted a voting delegate at thismeeting: American Academy of Pain Medicine.

The House composition is:

336 delegates representing state medical associations
77 delegates representing national medical specialty societies
10 section and service delegates representing medical students, resident physicians, hospital medical staffs, young physicians, Army, Navy, Air Force, USPHS, and the Veterans Administration.

Address of the President

James E. Davis MD, AMA President, called for continued AMA leadership in addressing the severe shortage of nurses and in dealing with the Resource-Based Relative Value Scale (RBRVS). Calling the AMA-proposed "Registered Care Technologist" an idea whose time has come, Dr. Davis asked for the opportunity to try it out in order to provide more bedside care givers. Turning to the RBRVS, Dr. Davis urged physicians to "remain unified and not split into warring factions." "American medicine cannot afford a divided profession," he added. "Indeed, if we divide, American medicine will not survive as we know it today."

Dr. Davis also reported on his inaugural challenge to physicians "to tithe four hours a week to community service." He stated that he was pleased with the response. "I have had many favorable communications from physicians, medical organizations, and public groups," Dr. Davis said. "They tell me they agree that physicians need to be more extensively perceived as caring individuals who take a vital part in community life."

Antitrust Speaker

Charles F. Rule, head of the Antitrust Division of the US Justice Department, gave a major policy speech to the House. He warned the delegates that felony criminal charges will be leveled against competing physicians if they fix fees, allocate patient territories, or boycott insurers. He said that ignorance of antitrust law or belief that actions were undertaken to improve patient care are no defense to criminal antitrust charges.

Items of Business

The delegates considered 66 reports and 129 resolutions. The AMA's position on the Resource-Based Relative Value Scale clearly dominated the meeting and commanded the majority of the delegates' time and attention.

Resource-Based Relative Value Study

The Speakers arranged the House schedule so that the RBRVS issue could be discussed alone in the Reference Committee without competing meetings. The discussion continued on Monday, and the Reference Committee prepared a report that offered accom-

modating amendments to the comprehensive Board analysis on the Harvard study.

The House approved the following recommendations:

Relative Value Scale

1. That the AMA reaffirm its current policy in support of adoption of a fair and equitable Medicare indemnity payment schedule under which physicians would determine their own fees and Medicare would establish its payments for physician services using:
   a. an appropriate RVS based on the resource costs of providing physician services;
   b. an appropriate monetary conversion factor; and
   c. an appropriate set of conversion factor multipliers.
2. That the AMA adopt the position that the current Harvard RBRVS study and data, *when sufficiently expanded, corrected and refined*, would provide an acceptable basis for a Medicare indemnity payment system.
3. That the AMA work with Harvard, the national medical specialty societies, the PPRC, HCFA, other interested and knowledgeable parties, and the Congress to refine and modify the Harvard RBRVS to ensure that it is technically adequate and can be implemented in a timely and minimally disruptive manner when needed revisions have been satisfactorily completed. Refinement and completion of the RBRVS will require:
   - appropriate restudy of the services of specialties whose RBRVS data have significant, documented technical deficiencies;
   - fundamental improvement of the measurement of practice costs and amortized specialty training costs;
   - expansion of the RBRVS to more specialties and services;
   - development of an extrapolation method for visits;
   - revision, refinement, and expansion of the measurement of pre- and post-work;
   - expansion and validation of the extrapolation methodology;
   - development of expanded relative value estimates for services for which global fees are customarily utilized as standard definitions are developed and accepted;
   - appropriate action to address concerns specific to individual specialties; and
   - that the AMA work to establish a mechanism to ensure that addtional concerns that may be identified are communicated to and addressed by the appropriate parties and external validation is conducted by the AMA.

Balance Billing

4. That the Association reaffirm its strong support for physicians' right to decide on a claim-by-claim basis whether or not to accept Medicare assignment and its opposition to elimination of balance billing.
5. That the AMA reaffirm its opposition to the continuation of the Medicare maximum allowable actual charge (MAAC) limits.
6. That the Association promote enhanced physician discussion of fees with patients as an explicit objective of a Medicare indemnity payment system.
7. That the Association expand its activities in support of state and county medical society-initiated voluntary assignment programs for low-income Medicare beneficiaries.

Transition

8. That a Medicare indemnity payment system be implemented through a blending transition, in which physician payments would be determined in increasing proportion by an RBRVS-based indemnity payment schedule and in decreasing proportion by the current CPR payment system, or prevailing charges only.The specific transition period should be chosen to strike an appropriate balance between minimizing disruptions for patients and physicians while minimizing the complexity of the process. In addition, the effects of the new system should be monitored during the transition, with corrections made as needed.

Geographic Payment Variations

9. That the AMA reaffirm its current policy that payments under a Medicare indemnity payment system should reflect valid and demonstrable geographic differences in practice costs, including professional liability insurance premiums. In addition, as warranted and feasible, the costs of such premiums should be reflected in the payment system in a manner distinct from the treatment of other practice costs.
10. That payment localities should be determined based on principles of reasonableness, flexibility, and common sense (for example, localities could consist of a combination of regions, states, and metropolitan/nonmetropolitan areas within states) based on the availability of high quality data.

Participants during a morning break at the registration area.

11. That geographic differentials should be addressed simultaneously with specialty differentials.

12. That, in addition to adjusting indemnity payments based on geographic practice cost differentials, a method of adjusting payments to effectively remedy demonstrable access problems in specific geographic areas should be developed and implemented.

13. That the AMA support the general principle that an RBRVS-based payment schedule should include differentials in payment for CPT codes where there are differential resource costs ("total work" and practice and training costs) across specialties. The following criteria should guide into establishment of differentials for specific services:

a. when the resource costs are substantially different across specialties; and

b. when the relevant codes are not sufficiently precise to differentiate among the content or physician work of a service across specialties, and cannot be readily refined to become so.

In addition, as few separate payment categories as possible should be established to minimize system complexity. In general, specialty differentials should be avoided except where absolutely warranted by resource cost data.

14. Specialty differentials should apply to all CPT-coded services for which a differential exists.

15. Where specialty differentials exist, criteria for specialty designation should avoid *sole* dependence on rigid criteria, such as board certification or completion of residency training. Instead, a variety of general national criteria should be utilized, with carriers having sufficient flexibility to respond to local conditions. In addition to board certification or completion of a residency, such criteria could include, but not be limited to:

a. partial completion of a residency plus time in practice;

b. local peer recognition; and

c. carrier analysis of practice patterns.

A provision also should be implemented to protect the patients of physicians who have practiced as specialists for a number of years.

Initial Conversion Factor

16. That the Association strongly oppose any attempt to use the initial implementation or subsequent use of any new Medicare payment system to freeze or cut Medicare expenditures for physician services in order to produce federal budget savings.

Updating the Fee Schedule

17. That whatever process is selected to update the RVS and conversion factor, only the AMA has the resources, experience, and umbrella structure necessary to represent the collective interests of medicine, and that it seek to do so with appropriate mechanisms for full participation from all of organized medicine, especially taking advantage of the unique contributions of national medical specialty societies.

Volume and Intensity

18. That the Association strongly oppose implementation of Medicare expenditure targets, which will lead to the rationing of care for Medicare beneficiaries, and instead support constructive approaches to enhancing quality and appropriateness of care.

Registered Care Technologists

The House received a progress report on the AMA's proposal to create a new category of bedside care giver called Registered Care Technologists (RCTs). The Board announced that one or more of similar programs would be evaluated and a pilot project would be implemented to demonstrate and evaluate the training of RCTs.

In a related action the House adopted an amended resolution proposed by the Reference Committee and the New York delegation that responded to testimony that the AMA should seek alternative proposals that will be less confrontational with our nursing partners. The resolution reads:

> That the AMA continue to seek solutions to the problem of the shortage of bedside care givers, in addition to the Registered Care Technologists Program.
> That the American Medical Association recognizing the concerns of our partners in health care, the nursing profession, work together with the American Nurses' Association and other nursing organizations to addressthe nursing shortage, and to continue to seek innovative ways to alleviate the acute shortage of bedside care providers, and that the Board of Trustees report to the House of Delegates at the Annual Meeting in 1989.

Faculty Sexual Involvement with Medical Trainees

Sexual harassment and sexual exploitation between medical trainees and their faculty supervisors was the subject of a resolution submitted by the Resident Physicians section.

The ethical issues raised by this conduct caused considerable debate including a personal account.

The House approved an amended resolution that calls on the AMA:

> To study the ethical issue raised by the existence of sexual harassment and sexual exploitation between medical trainees (medical students and residents) and their faculty supervisors, with particular attention to the effect of such relationships upon the quality of medical training, patient care, trainee evaluation, and the trainees' well-being; and
> To instruct its representatives to the Accreditation Council for Graduate Medical Education to encourage its Residency Review Committees to establish a mechanism to identify and eliminate instances of sexual harassment and for sexual exploitation in clinical training programs.

Professional Liability

Professional liability and insurance continues to be a major issue before the House of Delegates.

The House received a report describing the work of AMA's Special Task Force on Professional Liability and Insurance and the Advisory Panel on Professional Liability. The report discussed the continuing study of a number of resolutions relating to expert medical witnesses.

In other actions the House adopted policy calling on the AMA:

> To establish a policy that each physician should be able to maintain what he or she determines to be an appropriate amount of liability insurance except where otherwise required by state law; and
> To support the policy that physicians not be required to divulge the exact amount of their professional liability coverage as a condition of hospital medical staff privileges but should be allowed to provide verification that the minimum level of coverage required by the medical staff bylaws is in effect.

Alcohol Use During Pregnancy

The House approved a resolution asking the AMA:

> To seek appropriate federal or state legislation to requirethat warning signs, stating that drinking alcoholic beverages during pregnancy can cause birth defects, be posted in a prominently visible location in all places where alcoholic beverages are sold.

"Medically Unnecessary" Statements

The House commended the Board of Trustees for its activities on this issue and adopted the following policy:

> That the American Medical Association continue to call for the repeal of the "medically unnecessary" provisions of section 9332(c) of the Omnibus Budget Reconciliation Act of 1986; and
> That until such time as repeal is achieved, the American Medical Association urge the Health Care Financing Administration to require that there be stated on the medically unnecessary notices mailed by carriers (a) the basis for the denial; (b) the name, position, and title of the person to be contacted regarding questions about the review; and (c) the screening criteria or parameter used in denying payment for the service.

Nursing Homes

The House adopted the following statement regarding quality of care and physicians reimbursement in the nursing home setting:

> That the American Medical Association and the federation work to educate federal and state legislative bodies about the issues of quality from the perspective of attending physicians and medical directors, and express our commitment to quality care in the nursing home; and
> That the AMA work with legislative and administrative bodies to ensure adequate payment for routine visits and visits for acute condition changes including the initial assessment and ongoing monitoring of care until the condition is resolved; and
> That the AMA assist attending physicians and medical directors to develop quality assurance guidelines and methods appropriate to the nursing home setting.

Medicare Secondary Payer Program

The House adopted a recommendation submitted by Reference Committee G, that Resolution 131 submitted by the Maryland Delegation, correctly addressed a serious problem and strongly recommended its adoption. The House adopted the following resolution:

> That the American Medical Association urge HCFA to revise the Medicare Secondary Payer Program so that the determination of other insurance is made at the time of initial application or in a manner separate from the claims processing mechanism.

The Reference Committee further stated that they heard a series of complaints concerning the implementation of Medicare's Secondary Payer Program, problems stemming from the Program's procedure by which the carrier will not make payments on a claim until the beneficiary has responded to the inquiry regarding secondary payers. The Maryland Delegation is especially proud of the action taken by the AMA House of Delegates inasmuch as Resolution 131 was a Maryland submission.

Drugs

Mr. President and Members of the House of Delegates:

This past year the Committee's attention has focused on the prescribing practices of physicians referred to us by the Board of Physician Quality Assurance (BPQA) and on the regulations governing the prescribing of amphetamines. In some cases, patients have questioned the medications prescribed by their physicians and have filed complaints against them. These complaints are referred to us for evaluation and report to the BPQA. In other instances, during routine pharmacy surveys, the Division of Drug Control of the Department of Health and Mental Hygiene uncovers what appears to be questionable prescribing of controlled substances by physicians. This information is reported to the Chairman of the Committee on Drugs, who is appointed Medical Consultant to the Department of Health and Mental Hygiene. The Medical Consultant reviews the survey and if, in his

opinion, the prescribing is questionable, the survey is forwarded to the BPQA for referral in accordance with the Peer Review Management Protocol.

The other major area of discussion this past year related to the prescribing of amphetamines. Regulations governing such prescribing have been in existence for over 12 years; however, they have not been enforced to their full extent. The Committee explored the nature of the regulations and their interpretation and found that most physicians are not aware of these regulations, and many may be prescribing these medications outside the law. Authorization to prescribe amphetamines must be obtained from the Medical Consultant through written correspondence, which should include the patient's name or specific identifying information, the diagnosis, the medication prescribed, and information on how the diagnosis was reached. The physician then may be provided a permanent authorization to prescribe or be denied authorization. The process will be researched in the upcoming year to determine the current need for these regulations.

The Committee was involved in defeating legislation that would introduce Triplicate Prescription in Maryland. Committee members oppose such legislation for many reasons, including concern that physicians will discontinue prescribing needed medication to patients, fearing they may be questioned by the BPQA concerning their prescribing practices. The Committee also is concerned that there are insufficient treatment facilities for drug-addicted patients who want to be helped.

During the next year, the Committee anticipates developing and sponsoring educational programs for physicians on prescribing medications to their patients. Physicians should use the knowledge they obtained in medical school and their best judgment when prescribing medications. If a physician is suspicious about a particular patient, he/she should ask more questions or seek consultations with other physicians.

Committee members and staff will strive to maintain balance between educating physicians with careless prescribing practices and supporting discipline for physicians who misuse their prescribing privileges.

The Chairman is appreciative of the time, effort, and devotion of the Committee members and staff to this important aspect of physician education.

Emergency Medical Services

Mr. President and Members of the House of Delegates:

The Committee had many projects and subjects considered during the course of the year despite the low attendance at meetings.

The main activity was consideration of a possible compromise with the Managed Care Plans (MCP) and dealing with their clients as emergency patients. At the last meeting of the Committee, it was agreed that to treat these patients any differently than regular emergency patients might well jeopardize care or subrogate the excellence in care given. Therefore, it was resolved:

> All patients should be examined and medically screened regardless of their race, ethnic background, health care plan, or ability to pay.
> All patients should be treated the same and as expeditiously as possible.

Further:

> Based on patient care issues as well as federal legislative mandates, the EMS Committee of the Medical and Chirurgical Faculty recommends that only those patients be transferred to other facilities if such are not provided at the transferring facility.

It became the consensus of the small number of emergency physicians attending an ad hoc panel of MCP representatives, the Med Chi representatives, and members from ACEP that MCP did not wish to reach a meaningful understanding concerning the issues of emergency medical care.

Approximately 30 cases of less-than-optimal patient care or burdensome bureaucracy were heard and/or documented concerning the treatment of MCP patients. In the end, it was belived that by far the best plan would be to provide superior and equal medical care for all patients, without regard to their ability to pay for the services rendered.

Other items that the Committee worked on or completed are:

1. The approval of Criteria for Base Station Physicians.
2. Monitored the Medicaid Initiative and coordinated some of the effort in this regard with Maryland ACEP and members of Med Chi.
3. Monitored HCFA transfer issues as they relate to hospitals and Emergency Departments in Maryland.
4. Monitored and received for informational purposes from MIEMSS:
   a. Hospice Care Guidelines
   b. Base Station-Consultation Center Criteria
   c. Helicopter Transport issues
   d. Field Triage Tags
   e. Pre-Hospital Run Sheet updates
   f. Pre-Hospital Paramedic Standards
5. Reviewed Indigent Medical Care Issues.
6. Reviewed problems associated with the treatment of hypothermic patients.
7. Recommended support for various hand gun legislative efforts.

8. Assisted Maryland ACEP in the selection of a speaker for the Annual Meeting.
9. Sought to provide an editor for an EMS page/section of the *Maryland Medical Journal.*

Executive Director

Mr. President and Members of the House of Delegates:

The Faculty experienced a variety of new challenges this year. Through the dedicated teamwork of our physicians and staff, Med Chi tackled each of these challenges successfully. Highlighted below are several of the significant accomplishments of 1988-1989:

Board of Physician Quality Assurance

In August 1988, Governor William Donald Schaefer appointed 12 of the 15 members to the Board of Physician Quality Assurance. Med Chi made recommendations for 10 of these 12 Board members and has worked extensively to facilitate the transition between the Commission on Medical Discipline and the new Board. In September the Faculty petitioned the Board for a Declaratory Ruling on whether the law that provides for suspension and ultimate revocation of a physician's license on conviction of a crime of moral turpitude or a plea of guilty or nolo contendere with respect to a crime of moral turpitude applies to a physician who receives probation before judgment. The Board's decision on this issue is pending.

1989 Legislative Session

The 1989 session of the Maryland General Assembly proved very successful for physicians.

Med Chi was again confronted with the issue of Mandated Medicare Assignment and means testing. Testimony by President Michael R. Dobridge MD and several other physicians, in conjunction with the exceptional efforts of Med Chi's Legislative Committee, helped to sway the House Environmental Matters Committee, which defeated the bill by a 17-6 vote. Increasing public attention to this issue indicates that Maryland physicians must work harder and remain unified in order to successfully address this matter next year.

Med Chi actively supported a bill passed by the House in January that calls for increased participation in the Medicaid program by primary care physicians through the reduction of red tape, establishment of equitable reimbursement, and clarification of eligibility requirements. Following the passage of the bill, Med Chi contacted Presidents of Component Societies and other state societies to encourage participation in the Medical Assistance Program.

Med Chi worked extensively with members of the legislature to reduce restrictions on medical waste for physicians.

The House of Delegates voted to support the controversial statewide Gun Control Referendum passed in November, which bans "Saturday Night Specials" and undetectable handguns.

Liability Insurance

In September the Faculty gave its official endorsement to Medical Mutual Liability Insurance Society of Maryland. Legislated into existence by the Maryland General Assembly in 1975, Medical Mutual was designed to provide liability insurance coverage for Maryland physicians who were left without liability coverage when all other insurers left the state. In November the Governor's office announced that Medical Mutual would provide a 10 percent discount to all its policyholders who renew their policies in 1989. The discount was a result of the cumulative effects of tort reform and insurance legislation enacted by the General Assembly. In addition, Medical Mutual announced in April that it will not seek a rate increase in 1989. This is the third consecutive year that Medical Mutual has maintained its rates.

Medicaid

In September Med Chi surveyed its membership to determine opinions about the Medicaid program, particularly to respond to the pending Medical Assistance "Diversion of Services" program, which attempts to control the increasing costs of Medicaid services by diverting Medicaid beneficiaries from emergency rooms and hospital outpatient departments into private practice settings. Med Chi's Council declined to support the program as initially proposed and has recommended to the Chairmen of the Senate Administrative, Executive, and Legislative Review Committee that all providers of care, irrespective of the setting in which medical care is provided, should be reimbursed at the same level; that the Medicaid program modernize its billing process to facilitate processing of claims within 30 days or less; and that

eligibility rules be more clearly defined to facilitate immediate awareness of patients eligible and not eligible under the program.

To confront the problem of "grey area" patients who do not qualify for medical assistance but cannot afford health insurance, Council approved the concept of a Maryland Physicians Care Program. This statewide service will provide these patients with access to free primary health care from private practice physicians.

Medicare

Med Chi established an Interspecialty Committee composed of representatives from Maryland specialty societies in August 1988. The Committee was formed to obtain specialty society input on the Resource Based Relative Value Scale (RBRVS), a physician payment plan developed by Harvard University that may be used by the government to address the growing problem of Medicare reimbursement. Med Chi supports the AMA's position on RBRVS that states that RBRVS would be an acceptable foundation for a Medicare indemnity payment system if it is sufficiently expanded and refined. The AMA is working in conjunction with the Physician Payment Review Commission which maintains that it holds the primary responsibility for developing a complete RBRVS approach for physician payment under Medicare.

In an effort to address the perceived problems of access to Medicare, Med Chi created PreCare (Physician Referral for Elder Care). The program is a telephone referral network designed to provide Maryland Senior Citizens with names of physicians who accept medicare assignment. PreCare has the potential to provide every senior citizen in Maryland with quality medical care regardless of income, assets, or medical condition.

Med Chi Semiannual Meeting

Maryland Delegates Donna M. Felling and Tony Fulton, along with Med Chi Library Chairman Nancy T. Nichols MD, Med Chi Building Committee Chairman George S. Malouf MD, and Med Chi President Michael R. Dobridge MD cut the ribbon to dedicate the Louis A.M. Krause History of Medicine and Reading Room during the Semiannual Meeting. The dedication marked the completion of the Faculty building renovation project. In conjunction with the dedication, the Faculty's library was designated as the first international clearinghouse for literature and information on the medical problems of performing artists.

Dr. Michael Dobridge commends Elizabeth Linhardt on her outstanding fund raising efforts for the AMA - ERF Program in Maryland.

Med Chi Annual Meeting

"The Caring Physician" was the theme of Med Chi's 191st Annual Meeting at the Turf Valley Hotel and Country Club in Ellicott City on April 12-14, 1989. Former AMA President Edward R. Annis MD and John Lee Clowe MD, Speaker of the House of Delegates for the American Medical Association, discussed the challenges posed by today's health care system during a plenary session. Many thanks are in order to all Med Chi and Auxiliary Members, speakers, and exhibitors who helped make this year's meeting successful.

Peer Review Manual

A *Peer Review Manual* was developed in a joint effort between Med Chi and its Component Societies under the chairmanship of Emidio Bianco MD. The manual, approved by Council in March 1989, will provide guidance and assistance in the conduct and process of physician peer reviews.

Hospital Medical Staffs

This year there was a growing concern regarding the "independent status" of hospital physician staffs. As a result, Med Chi Council approved a Hospital Medical Staff Legal Representation Project whereby Maryland's hospital physicians can seek legal advice regarding hospital bylaws, corporate structures, and business entities. One goal of this project is to develop model hospital bylaws specific to Maryland law. These bylaws would be consistent with the requirements of the Joint Commission on Accreditation of Healthcare Organizations and standardized for use by all Maryland hospitals.

Annapolis Office

In February 1989 Med Chi purchased a building located at 224 Main Street in Annapolis. The building will serve as Med Chi's legislative headquarters and will provide Maryland physicians with a permanent presence in our state capital.

FAX Machine Network

In an effort to increase communication between Med Chi, its membership, and component societies

the Faculty installed a FAX machine network. Fourteen component societies now have the capability to communicate with the Faculty's main and legislative offices via Fax machine. Med Chi has offered special funding to the remaining components for the purchase of FAX machines.

Women in Medicine Committee

In January 1989 a new ad hoc Committee on Women in Medicine was organized to address issues of concern to women physicians such as leadership development for women, day care programs, salary discrimination, and recruitment of women into organized medicine.

Med Sig

In February 1989 Med Chi introduced a new Med Chi Messages section to the already established Med Sig Computer Bulletin Board System. The new service will provide announcements as well as updates on programs and events at Med Chi and around the state. In addition, questions or requests for clarification of any announcement may be entered directly into the system, allowing Med Chi to respond to any issue almost immediately.

It has been both an honor and a privilege to serve the Faculty's membership this year. I sincerely thank the leadership of Med Chi and all its member physicians who have contributed to the culmination of our efforts and who should take pride in their many successes.

Angelo J. Troisi, FACHE, Executive Director

Finance

Mr. President and Members of the House of Delegates:

The Finance Committee met with representatives of the Bowman Financial Management Company, Inc. to review the Faculty investment portfolios of the Consolidated Funds, Steiner Fund, Beck Fund, Funded Reserve, and the Pension Plan Funds.

The strength of the economy in 1988 proved to be a pleasant surprise to almost everyone, especially those who feared a recession after the October 1987 stock market diaster. The GNP grew at a 3 percent rate and inflation was held to slightly over 4 percent.

The outlook for 1989 is positive. Some modest rise in interest rates could offer attractive yields and opportunities to lock in inestments returns at low risk.

The market value of the pension plan portfolio at year end was $1,418,072, which reflects a total return since the inception of 31.2 percent.The Consolidated Fund market value was $1,457,683, and the Steiner Fund market value was $882,716.

Hospital Medical Staffs

Mr. President and Members of the House of Delegates:

The Committee on Hospital Medical Staffs continued its active meeting schedule during the past year to address issues involving hospital medical staffs and their relationship with hospital administration and with hospital governance bodies.

Policy initiatives developed by the Committee and authorized by the Council have been implemented. Med Chi's centralized legal service to advise subscribing medical staffs on legal matters of concern is now operational, and services have been provided to five subscribing medical staffs at this time. The legal service is based on the fact that organized hospital medical staffs are independent entities, and as such, they should retain independent counsel.

Additionally, model hospital bylaws specific to Maryland law have been developed and the substance therein is available to subscribing hospital medical staffs through the Med Chi Legal Service.

In the area of quality assurance, the Committee on Hospital Medical Staff has been designated by Council as a medical review committee and is available to provide consultative expertise in this area. This is in keeping with the relationships established during the past year with the State Division of Licensing and Certification wherein the Committee on Hosptial Medical Staffs functions as a consultative resource to the hospital licensing authority.

Other activities included strengthening organizational ties with the AMA Hospital Medical Staff Section so as increase participation by Maryland hospital medical staff representatives at the AMA level.

As Chairman, I wish to extend my sincere appreciation to the members of the Committee for their valuable contribution to the profession.

Legislative

Mr. President and Members of the House of Delegates:

The 1989 Maryland General Assembly was another productive legislative session for the physicians of Maryland. With the guidance and support of Governor William Donald Schaefer, Speaker of the House R. Clayton Mitchell, Jr., and President of the Senate, Thomas V. Mike Miller, Jr., many needed changes in the present law were effected. Other measures designed to erode the quality of health care in Maryland were defeated.

The physicians of Maryland were well represented through the Co-Chairs of the Legislative Committee, Israel Weiner MD, J. Leonard Lichtenfeld MD, Nelson Goodman MD, and Susan Guarnieri MD.

The following account of major issues considered by the Legislative Committee of the Medical and Chirurgical Faculty covers only legislation tracked by the Government Relations Office of significant statewide interest.

The Government Relations Office is staffed to answer and address concerns of physicians through legislative action. Contact Gerard E. Evans, Esq., General Counsel, 224 Main St., Annapolis, MD 21401 if you have any concerns or questions about how the office may assist you.

The Faculty thanks F. Carvel Payne, Director, State Department of Legislative Reference for graciously providing most of the following information.

The 1989 Session of the Maryland General Assembly had several surprises, not in terms of legislation introduced or amended but in the way that several physician groups addressed major bills. Although the Medical and Chirurgical Faculty is widely recognized as *the* institution that speaks for Maryland physicians, it becomes increasingly difficult to present a united front when other medical groups hold positions different from the state Medical Society and, in fact, oppose the Faculty's legislative agenda. Most Legislators, like the public at large, become confused when confronted with diverse and opposing views concerning the practice of medicine. At the national level, some physician's groups are acting independently of organized medicine. Unfortunately, we now see this happening in Maryland. Fortunately, the Faculty has a proud tradition in Annapolis working with Legislators. Consequently, the Faculty's opinion carries significant authority.

The first order of business for the 1989 Maryland General Assembly was the override of the Governor's veto of HB 619. This override ended a valiant perennial effort on the part of Med Chi and the Maryland Society of Eye Physicians and Surgeons. The Faculty remains convinced that the optometrists will not stop with the use of topical ocular agents but will continue to attempt to expand their scope of practice through legislation rather than education.

The Faculty enjoys success in Annapolis largely due to the effort of individual physicians. Countless physicians took time from their practices and families to promote Med Chi's lobbying effort during the 1989 Session. Unlike many other organizations, Med Chi members as individual practitioners have relationships with members of the Maryland General Assembly. These relationships, founded on trust, give physicians invaluable access to Legislators, who respond not to some faceless organization but to the needs of a highly regarded association comprised of dedicated medical practitioners. If the Faculty is to enjoy continued success in Annapolis, these physician key contacts must be further developed and expanded.

Mandated Medicare Assignment

For the third consecutive year Delegate Paul Pinsky *et al.*, introduced legislation proposing Mandated Medicare Assignment in Maryland. As introduced, HB 395 had six co-sponsors, although shortly after it was printed, Delegate John Jefferies withdrew his sponsorship, thanks to the good work of Senator Larry Young from Baltimore City.

Prior to the 1989 Session groups such as the National Association of Retired Persons, the American Association of Retired Persons, the Senior Action Council, and the Citizen Action Coalition embarked on an intensive lobbying effort making Mandated Medicare Assignment their highest priority. Seniors met with individual Legislators, developed a petition and letter-writing campaign while encouraging other groups to join their cause. Other groups, particularly some labor organizations did lend their name and support in pushing mandated assignment.

Although strict Mandated Medicare Assignment was easily defeated during the 1988 Maryland General Assembly in the House Environmental Matters Committee by a vote of 19 to 4, there seems to be a growing tide of support for a Mandated Medicare Assignment law with a means test. In previous years, sentiment for a means test on the Environmental Matters Committee has been strong and was expressed by many of the Delegates during the interim. When the 1989 Session began, several Delegates on the Committee drafted amendments to Delegate Pinsky's bill that would have established a means test. Many Legislators could not understand the Faculty's opposition to a means test especially if it were drawn at a very low-income level. Their statements included "If you are doing it already, why would you object to it in statute?" The answer is found in the question itself. We argued there is no need for a means test if it is being utilized, albeit informally. We cited the Faculty's Pre-Care program that guarantees every senior in Maryland a physician who would accept assignment as payment in full. This program has been met by public officials with enthusiasm and support. This telephone referral service has not been deluged with calls because it has been repeatedly proved that physicians are sensitive to the financial

plight of seniors in need. It was apparent that given the extremely high percentage of claims accepted regularly on an assigned basis there is no real need in the senior community.

Talk of means-tested Mandated Medicare Assignment circulated throughout the physician community as well. On November 19, 1988 a special meeting of the Faculty House of Delegates was held to debate and vote on the issue of Mandated Medicare Assignment. In a unanimous show of strength and unification, the Faculty voted to oppose *any* Mandated Assignment, means tested or not.

As the hearing in Annapolis approached, the Faculty's lobbying effort intensified. The component and specialty medical societies responded with an effective telephone and letter-writing campaign. House Committee members were swamped with phone calls and letters from individual physicians. Likewise, the seniors and their associated comrades intensified their efforts by bringing busloads of seniors from targeted legislative districts to meet with House Committee members.

The Faculty has always argued that because Medicare is a federal program it should be addressed through the United States Congress. State-by-state piecemeal adjustments would only create a patchwork of rules and regulations, not a consistent program. This argument was used convincingly in Annapolis. The Committee was informed about the Resource Based Relative Value Scale and its potential impact on the method and amount of physician payment. The fact that the Physician Payment Review Commission (PPRC) would be studying this subject convinced some Committee members they should wait to see what the federal investigations brought forth.

In a similar vein, the Governor had established a Commission on Health Care Policy and Financing, Chaired by Eugene Feinblatt, Esquire, to examine health care and delivery in the broadest possible terms. Delegate John Arnick, House Majority Leader and Chairman of the House Environmental Matters Committee found the issue of Mandated Medicare Assignment to be one perfectly suited for the Feinblatt Commission to examine. On January 25, 1989 Delegate Arnick asked the Feinblatt Commission to study the issue of Mandated Medicare Assignment. The response from the Feinblatt Commission indicating their willingness and desire to examine the issue of Mandated Medicare Assignment was received and distributed just prior to the legislative hearing. This issue was used by the Faculty in attempting to defer action on assignment during the 1989 General Assembly.

However, one week prior to the hearing our effort was dealt a damaging blow. Staff members from the American College of Physicians (ACP) informed the Faculty that they intended to testify in favor of HB 395. The Faculty was shocked and dismayed. The ACP had offered testimony before the PPRC indicating a willingness to accept Mandated Medicare Assignment with a means test. The College was preparing to offer similar testimony before the Maryland General Assembly on HB 395. None of the local physicians active in the ACP knew anything about this testimony. The Faculty was able to blunt the effect of this information by pointing out that the testimony of ACP was taken out of context and did not directly pertain to HB 395. Mandated Medicare Assignment was defeated for the third year in a row due in large part to the incredible individual effort on the part of Med Chi members. Not only do those physicians who testified on the bill deserve special praise, but also those countless other practitioners who contacted their legislators to make sure the voice of medicine was heard loud and clear in Annapolis.

Public Health

Acquired immune deficiency syndrome (AIDS) and the Medical Assistance Program were each the subjects of omnibus legislation this year. The bills introduced in those areas were the products of extensive study and debate during the 1988 Interim. The Faculty expressed its views on these subjects to various groups examining the topics.

AIDS

Nationally, 82,406 cases of AIDS and 46,134 deaths were recorded as of December 1988. There has been a sharp increase in the number of cases reported. Although some of this increase is due to more comprehensive reporting criteria, the data clearly indicate the AIDS epidemic is continuing to grow.

Concern over the many policy issues associated with AIDS prompted Governor Schaefer in 1987 to appoint the Advisory Council on AIDS, comprised of physicians and other health care providers, representatives of the Departments of Health and Mental Hygiene, Human Services, and Public Safety and Corrections, and members of the community. This year, the Advisory Council had omnibus legislation introduced addressing several diverse policy areas. In addition to omnibus bills filed in both the House and the Senate, 22 other bills on the subject of AIDS were introduced.

Senate Bill 719/House Bill 1346 (both passed), the omnibus bills have several major provisions. First, the bills prohibit all health professionals from withholding, refusing, denying, or discriminating against an individual who has tested positive for the presence of the human immunodeficiency virus (HIV) infection. Second, the legislation requires a health care provider to obtain the informed consent of an individual prior to testing for the HIV infection and requires the Department of Health and Mental Hygiene to develop a uniform written informed consent form to be used for this purpose. (Legal doctrines already required physicians to obtain informed consent before drawing the test. This language merely codified the practice.) Third, the legislation allows a physician to inform the local health officer of an individual's HIV positive status, if that individual refuses to notify his or her sexual and/or needle-sharing partners. A physician

who discloses or chooses not to disclose an individual's HIV positive status to a partner is provided immunity from actions related to a breach of patient confidentiality. This immunity also is extended to a hospital or any other health care provider who performs or interprets a test for the presence of HIV pursuant to a physician's order. The Faculty fought hard for this immunity provision in the hopes it would ease the burden on the practitioner in these cases.

Fourth, Senate Bill 719/House Bill 1346 add correctional officers to the list of first responders who must be notified by medical facilities if the correctional officer comes into contact with an inmate subsequently diagnosed as having HIV or any other contagious disease or virus. The chief medical officer or his designee also are required to provide first responders with notification of their possible exposure.

Fifth, Senate Bill 719/House Bill 1346 provide that when a correctional employee has been exposed to the bodily fluids of an inmate as a result of a violation of institutional regulations, the correctional employee may request that the inmate be required to furnish a blood sample to be tested for HIV. The correctional employee is to be notified of the results of the test and the availability of counseling, if necessary. Sixth, the legislation makes it a misdemeanor for an individual to knowingly transfer or attempt to transfer HIV to another individual. Finally, the bills require the Secretary of Health and Mental Hygiene to establish and conduct an educational program on acquired immune deficiency syndrome (AIDS) for those individuals convicted of certain sexual or drug offenses who are required by a court to complete the program.

Similar concepts contained in other bills - Senate Bill 21, Senate Bill 177, House Bill 114, Senate Bill 51, House Bill 760, and Senate Bill 286 - did not pass, but were incorporated in the amended version of the omnibus bills.

In addition to the omnibus AIDS bills, House Bill 641 (passed) removes the prohibition on the sale of contraceptives or contraceptive devices through vending machines or other automatic devices in locations other than where alcoholic beverages are sold, in order to control the spread of AIDS and other contagious diseases or viruses. The bill retains the prohibition on selling contraceptives or contraceptive devices in schools and specifies that only latex condoms may be sold in vending machines.

The Legislature considered, but did not pass, Senate Bill 331 and House Bill 32 (both failed), which would have required notification to morticians or notification on a death certificate if the deceased was diagnosed as having AIDS, AIDS-Related Complex (ARC), or HIV. House Bill 1461 (failed) that would have required morticians to use universal precautions also failed. Three bills (Senate Bill 19, House Bill 300, and House Bill 796) (all failed) would have required mandatory testing for sex offenders, and Senate Bill 20 (failed) would have required testing for persons committing certain crimes where an exposure had occurred. Another related bill, House Bill 1161 (failed), would have required all inmates to be tested for the presence of HIV. House Bill 543 (failed) would have mandated reporting to the Department of Health and Mental Hygiene the names of persons testing positive for HIV.

Two bills aimed at the insurance industry and AIDS testing were referred to Interim study. House Bill 1273 (failed) would have allowed a health maintenance organization (HMO) to test applicants or subscribers for HIV or a medical condition related to HIV, if the test is given to all such individuals or the decision to test is based on an individual's medical history. Further, the bill would have prohibited a HMO from refusing to renew coverage or from limiting coverage due to an individual's positive HIV test result. House Bill 1275 (failed) would have permitted a life or health insurer to test an applicant or an insured for HIV (or a medical condition related to HIV) if the test was given to all individuals in the same risk class with the same coverage or the test was based on medical history or condition. However, House Bill 1275 would have prohibited an insurer from canceling, excluding, restricting, or limiting benefits due to a positive HIV test result or a related condition.

Medical Assistance Program

Medicaid is a $1.12 billion federal and state funded program providing medical care to 342,000 indigent and medically indigent persons in Maryland. State expenditures for medical assistance have more than doubled over the past eight years, while the average monthly enrollment declined slightly.

The Special Joint Legislative Committee on Medical Assistance was appointed during the 1988 Interim in response to conflicting pressures during the 1988 Legislative Session to enhance program benefits and eligibility and to cut costs. The Committee, as directed, undertook a comprehensive review of the Medical Assistance Program and made extensive recommendations. The omnibus legislation, Senate Bill 794/House Bill 1052 (both passed), introduced as a result of the

Med Chi Past-President Dr. Roland Smoot enjoying conversation at the Presidential banquet.

final report of the Committee, set the overall direction and tone for the Program's future development.

The Faculty testified many times before the Joint Committee and had some influence in the drafting of the final legislation. In searching for a solution to low participation by physician providers, many legislators saw the answer as requiring physicians to take a certain percentage of Medicaid patients as a condition of hospital privileges. The Faculty was successful in defeating this notion. Finally, the Committee agreed that some of the major impediments to physician participation are poor reimbursement and nonsensical red tape. This legislation does not solve all the Program's problems but is a step in the right direction.

Specifically, Senate Bill 794/House Bill 1052:

1. Set in statute policy goals for the entire Medicaid program;
2. Expanded eligibility for comprehensive medical care to pregnant women and their children up to a year old whose family income is under 185 percent of the poverty level, and to children up through two years old whose income is below 100 percent of poverty;
3. Increased reimbursement levels for certain physician procedures, particularly primary care;
4. Required that the program include managed care pilot programs;
5. Permitted the Secretary of the Department of Health and Mental Hygiene (DHMH) to continue a contract with a provider without going through a formal renewal process;
6. Placed a moratorium on Letters of Intent and Certificate of Need applications for nursing home beds until July 1, 1990, and
7. Mandated the continuation of the Special Joint Committee on the Medical Assistance Program until 1992.

Another bill affecting the Medical Assistance Program, House Bill 836 (passed), requires DHMH to adopt regulations and procedures to review every three years the prices of durable medical equipment supplied to medical assistance recipients.

House Bill 815 (passed) revises the income limits for participation in the Pharmacy Assistance Program, a state-funded program distinct from Medical Assistance. The bill also states that providers may not be reimbursed for more than the rate assigned for a generic equivalent for any drug, unless the physician indicates the drug is medically necessary. Additionally, House Bill 815 authorizes the Department of Health and Mental Hygiene to require potential recipients to apply for eligibility for Medical Assistance within 60 days of notification by the Department to do so.

Civil Actions and Procedures

Immunity from Liability The General Assembly granted limited immunity from civil liability to various individuals and organizations.

Two bills expanded the category of associations and organizations covered under provisions of existing law that provide immunity from personal liability for agents providing services or performing duties on behalf of the association or organization and limit the liability of the association or organization itself, if the association or organization maintains insurance coverage that satisfies certain specified criteria.

House Bill 66 (passed) extends provisions of existing law granting immunity from liability to certain volunteers of charitable organizations currently exempt from taxation under S 501(c)(3) of the Internal Revenue Code to include volunteers of corporations that are subject to S 501(c)(4) of the IRS Code (civic leagues), S 501(c)(5) of the IRS Code (labor, agricultural, or horticulture organizations), and S 501(c)(6) of the IRS Code (business leagues, chambers of commerce, real estate boards, boards of trade, and professional football leagues not organized for profit).

Limitation on Noneconomic Damages Senate Bill 899 (passed) clarifies a procedural issue relating to the $350,000 cap on noneconomic damages that applies under current law to any personal injury action in which the cause of action arose on or after July 1, 1986.

The bill prohibits a jury from being informed of the cap and requires a court to reduce a jury award to conform to the cap, if the jury awards an amount that exceeds it.

The bill was introduced in response to the decision in *Franklin v. Mazda Motor Corporation, Slip. op.* dated February 2, 1989, Civil Action No. PN-87-2203, in which the United States District Court for the District of Maryland held that existing law should be interpreted so as to require that the jury be instructed by the court not to return a verdict for noneconomic damages in excess of $350,000.

Health Claims Arbitration

House Bill 776 (passed) modifies the certification requirements under the Health Care Malpractice Claims Act for any claim filed with the Health Claims Arbitration Office on or after July 1, 1989. Under the bill, a party may not serve as a party's expert on a certificate of merit and the certificate may not be signed by a party, an employee or partner of a party, or an employee or stockholder of any professional corporation of which the party is a stockholder.

The bill also creates an exception to the requirement that a claim filed with the Health Claims Arbitration Office be dismissed if the claimant fails to file, within 90 days from the date of the complaint, a certificate of a qualified expert attesting to departure form standards of care and that the departure proximately caused the alleged injury. Under this bill, in lieu of dismissing the claim, the panel chairman is required to grant an extension of not more than 90 days for filing the certificate, if the statute of limitations has expired and the failure to file the certificate was neither willful nor the result of gross negligence.

Finally, the bill authorizes, rather than requires, a

claim to be adjudicated in favor of the claimant on the liability issue if the defendant disputes liability and fails to file within 120 days from service of the certificate of a qualified expert on the defendant, a certificate of a qualified expert attesting to compliance with standards of care or that the departure was not the proximate cause of the injury. The provisions of this bill are to be applied prospectively only.

Personal Injury Protection

Senate Bill 170/House Bill 335 (both passed) allow a purchaser of an automobile insurance policy to waive coverage for personal injury protection (PIP) benefits for all named insureds and listed drivers over 16 years of age covered by the policy. Current law mandates PIP coverage and requires an insured to carry a minimum of $2,500 of benefits payable for medical expenses and lost wages resulting from an automobile accident, regardless of fault. Under Senate Bill 170/House Bill 335 drivers still have to carry PIP coverage for pedestrians, passengers who are not named insureds, and family members under 16. If a driver waives coverage, the waiver applies to all PIP benefits provided under the first-named insured's policy or any other private passenger motor vehicle liability policy or coverage in the state. Cost savings for a driver who waives PIP coverage will vary from $15 to $250 a year, depending primarily on the area of the state in which the driver resides.

Health and Life Insurance

Mandated Benefits The Governor's Commission on Health Care Policy and Financing formed a Committee on Mandated Benefits to investigate the social and economic impact of mandated benefits and to develop a coherent policy on mandated benefits. At the Committee's request, the General Assembly did not enact any additional mandated benefits. The General Assembly maintained the status quo on existing mandates with the passage of Senate Bill 78 (passed) which extends the sunset on the mandate for mental illness until June 30, 1991.

Long Term Care House Bill 694 (passed) establishes the Long-Term Care Insurance Act. The Act stipulates that insurers may not cancel, refuse to renew, or otherwise terminate a long-term care policy because of age or deterioration of the mental or physical health of an insured. It prohibits the exclusion of certain provisions in long-term care policies, and prohibits limiting coverage to skilled nursing care, conditioning eligibility for benefits at one level of care on the receipt of higher levels of care, or requiring prior institutionalization. The Act requires that long-term care insurance provide coverage for senile dementia disorders, including Alzheimer's disease.

Medicare Supplemental Policies The Medicare Coverage Act passed by the U.S. Congress expanded the health benefits available through the medicare program and has required a modification in the benefits offered through medicare supplemental policies to conform with the changes in the medicare program. House Bill 1521 (passed) amends Maryland's Medicare Supplement and Specified Disease Act to specify that if a medicare supplemental policy duplicates benefits now provided through medicare, these benefits must be increased or the premiums reduced. In addition, the bill enhances consumer protection provisions under the Act by requiring insurers to outline, to all applicants, the coverage provided in a medicare supplemental policy and by requiring insurers to submit an advance copy of all advertisements on policies to the Insurance Commissioner.

AIDS Testing The outbreak of AIDS has raised the question as to when an insurer or health maintenance organization may require an AIDS test prior to underwriting individual risks and the procedures that must be followed for such testing. House Bill 1375 (failed) and House Bill 1273 (failed) would have established procedures and standards for AIDS testing and underwriting.

Prescription Drug Reimbursement Senate Bill 730/House Bill 338 (both passed) prohibit individual or group policies that provide benefits for pharmaceutical products from imposing a copayment, deductible, or other condition on an insured who uses the services of a community pharmacy, if those conditions are not imposed when an insured utilizes the services of a mail-order pharmacy.

House Bill 1064 (passed) requires insurers to reimburse insureds for pharmaceutical products in the same amount for all authorized prescribers. The bill also prohibits the coordination of health insurance benefits with intensive care benefits.

Health Maintenance Organization The General Assembly enacted two bills expanding the regulatory authority of the Insurance Commissioner over health maintenance organizations and preferred provider organizations. Senate Bill 758/House Bill 1405 (both passed) require HMOs to submit an insolvency plan to the Insurance Commissioner by January 1, 1990. The bills stipulate the actions the Insurance Commissioner may take as a rehabilitator or liquidator (subject to court approval) in the event of an insolvency of an HMO. They also provide that an enrollee or subscriber of an HMO is not liable to a provider for services rendered.

Mental Health

Senate Bill 156 (Ch. 31) removes the prohibition on the transportation of a person to or from a facility for the mentally ill by someone of the opposite sex and permits the Chief Executive Officer of the facility to allow transportation by a person of either sex, if appropriate.

Senate Bill 56/House Bill 50 (both passed) also pertain to the legal rights of the mentally ill. The bills prohibit a cause of action and disciplinary action against a mental health care provider or the administrator of a facility for failing to predict, warn of,

or take precautions against a patient's violent behavior, unless the provider knew of the patient's propensity for violence, and the patient indicated to the provider or administrator an intention to inflict imminent physical injury upon a specified victim or group of victims.

The Faculty worked very closely with the psychiatric community in defeating SB 638, which would have required hospitals to grant admitting privileges to licensed psychologists. This was killed on the last day of the Session in a Conference Committee action.

Health Occupations

Fees In recent years, concern has been expressed that, of all the health occupation boards, only a small number generate sufficient revenue from their licensing fees to cover the various costs of regulating their profession. In addition, the excess revenue generated by several boards is used to indirectly subsidize those boards that are not self-supporting. Senate Bill 264 (passed) authorizes each health occupation board to set reasonable fees for the issuance and renewal of licenses and other services provided by the board. The bill also requires the Secretary of Health and Mental Hygiene and representatives of the health occupation boards to assess and report to the General Assembly on the administrative, fiscal, and budgetary impact on each board resulting from the setting of licensing fees by each board and on the indirect costs of administering each board. This information will be helpful in studying the overall financing of the boards.

Dispensing of Prescription Drugs Pursuant to legislation that passed the Maryland General Assembly three years ago, the Board of Physician Quality Assurance was directed to create, through regulation, guidelines concerning the dispensing of pharmaceuticals in physicians offices. The Maryland Pharmacists Association obtained draft regulations from the Physician Quality Assurance Board , and because the Pharmacists grew impatient with the progress of the Board they decided to have legislation introduced. However, the legislation introduced was no more intrusive or dangerous than the draft regulations promulgated by the Board itself.

Dr. David Nagel, Dr. Christopher Harvey, and Dr. Harold Bob pose together before the Presidential banquet.

Consequently, legislation was passed affecting the dispensing of prescription drugs by physicians, dentists, and podiatrists. Senate Bill 732/House Bill 1299 (both passed)change the conditions under which these health practitioners may dispense drugs by requiring each practitioner to obtain a written permit from his or her regulatory board in order to dispense. A permit is not required, however, to dispense starter dosages or free samples. Additionally, the bills specify that the practitioner may dispense drugs to a patient only if a pharmacy is not convenient to the patient and the practitioner is physically present on the premises where the prescription is filled and performs a final check of the prescription before it is provided to the patient.

Physicians

Legislation was approved providing additional immunity protection for actions brought against medical review bodies and physicians participating in professional peer review activities. Senate Bill 109 (Ch. 17) (passed) reflects the decision of the state to opt out of the federal Health Care Quality Improvement Act of 1986 and instead to be governed by the Maryland Medical Practice Act. The Maryland Act provides greater immunity protection for actions brought under State law.

Although legislation was enacted in 1987 that required certification of medical and nuclear radiation technologists, the new Board of Physician Quality Assurance has not yet adopted the regulations. Accordingly, House Bill 1489 (passed) extends the date for certification of medical and nuclear radiation technologists from July 1, 1989 to February 1, 1990. The bill also authorizes the Board of Physician Quality Assurance to issue a certificate of temporary authority to an individual employed as a medical radiation technologist or a nuclear medical technologist as of August 1, 1988.

Nurses

A package of bills was introduced in response to the recommendations of the Governor's Task Force to Study the Crisis in Nursing. These bills seek to increase the number of nurses practicing in this State, since manpower shortages currently exist. Senate Bill 703 (passed) allows a registered nurse who graduated prior to September 9, 1979 from a Diploma Nursing Program or an Associate Degree Nursing Program to validate prior education, before entering a baccalaureate nursing program, by successfully completing three transition courses. Senate Bill 704 (passed) directs the Maryland Higher Education Commission to establish a Task Force to investigate and implement changes in the nursing education curricula of community colleges in order to promote access to nursing education and to enhance career mobility. Senate Bill

705 (passed) directs the University of Maryland School of Nursing Task Force to investigate the feasibility of implementing a cooperative nursing degree program at the School of Nursing.

Senate Bill 706 (passed) extends eligibility for general State scholarships to include part-time nursing students. The bill also grants priority participation in the Loan Assistance Repayment Program to certain nursing students. In addition, each recipient of a nursing scholarship may be entitled to a grant to meet certain living costs.

Senate Bill 707/House Bill 1362 (both passed) establish a Health Manpower Shortage Training Grant Program to be administered by the State Scholarship Administration. Under the bills, an eligible school must use each grant to enhance or expand approved education program leading to licensure or certification in a health occupation determined to be in short supply.

Senate Bill 744/House Bill 1274 (both passed) authorize the State Board of Nursing to place a licensee on inactive status. The bills are aimed at preventing the disenfranchisement of nurses who do not fulfill the current active practice requirements but who wish to retain their title under an inactive status registration certificate.

Hospitals

House Bill 471 (passed) prohibits smoking in acute care hospitals outside of designated smoking areas, unless a physician has specifically authorized a patient to smoke. Facilities treating mental disorders and those where the average length of stay exceeds 30 days are excluded from the provisions of the bill.

Senate Bill 534 (passed) repeals the requirement that a hospital administrator, as part of an admission procedure, ascertain whether a person is an organ or tissue donor. Administrators are still required, however, to make donation requests upon the death of an appropriate donor.

Senate Bill 638 (failed) would have required hospitals and nursing homes to provide in their bylaws, rules, or regulations for the use of their facilities by, and staff privileges for, qualified psychologists.

Alternative Health Systems

While House Bill 1479 (passed) (which includes health maintenance organizations, preferred provider organizations, and independent practice organizations in the disciplinary reporting network currently in place for hospitals and nursing homes) is one of several bills introduced to safeguard the solvency of health maintenance organizations (HMOs) and to protect consumers who contract with HMOs. House Bill 59 (passed) requires an HMO licensed on or after July 1, 1989 to have an initial surplus exceeding its liabilities by at least $1.5 million. The surplus requirements for an existing HMO are increased over the next two years, so that by July 1, 1991, the surplus is required to be the greater of $750,000 or 5 percent of subscription charges, with the maximum surplus required capped at $3 million. Senate Bill 758/House Bill 1405 (both passed) provide the Insurance Commissioner with additional authority as a rehabilitator, in the even an HMO becomes insolvent, and require each HMO by January 1, 1990 to develop an insolvency plan.

Medical Laboratories

The background concerning SB 297 began last year as Senate Bill 659, introduced by Senator Leo Green from Prince George's County. SB 659 was defeated and the Senate Finance Committee directed the Department of Health and Mental Hygiene (DHMH) to do a study on physician-operated labs in association with the Faculty. Unfortunately, there was never any cooperation from the DHMH, but rather they conducted a survey and published the results three weeks prior to the opening of the 1989 Legislative Session. Their claims included poor training of medical technologists, faulty equipment, and general lack of proficiency on the part of physicians in their lab practices. We disputed the findings vigorously and publicly.

The legislation as introduced was unacceptable to the Faculty and we testified accordingly. However, several physician groups testified in favor of the legislation including the American Academy of Pathology and the American Society of Clinical Pathologists. This situation posed an extremely difficult lobbying endeavor. Anytime physician groups are pitted against one another, the chances of achieving full success are diminished.

Members of the Senate Finance Committee and members of the Department approached the Faculty in hopes of negotiating a compromise. The Executive Committee of Med Chi felt this issue important enough to call a special Council meeting and discuss the options. The Council discussion took place against the following backdrop. In December 1988 Congress passed legislation that by 1991 will regulate *all* physician-operated laboratories. Therefore the issue quickly focused not on whether physicians would be regulated in their labs but rather when and how the regulation would occur. The federal legislation indicated that if state regulation were in place and effective the feds may opt out and allow the state sole regulatory authority. Council voted unanimously to support a modified version of Senate Bill 297. The Council's amendments specifically required the DHMH to publish a list of those tests which would be exempted from any regulation and further required the DHMH to create a liaison committee on laboratory review comprised of physicians appointed by the Faculty.

Senate Bill 297 (passed) requires the Secretary of Health and Mental Hygiene to exempt a physician or group of physicians from the need to hold a permit to operate a medical laboratory if the physician or group of physicians: (1) Performs or personally supervises the test procedure and the procedure is only for the physician's patients; and (2) The physician performs

only those limited laboratory examinations specified in the bill. However, exempted physician laboratories must participate in a proficiency testing program.

Infectious Waste

In response to medical waste washing ashore from illegal disposal practices, the Departments of the Environment and of Health and Mental Hygiene adopted emergency special medical waste regulations in the fall of 1988 enumerating the required handling, treatment, and disposal procedures for special medical waste and establishing a system to track its disposal. During the 1989 Session several bills were considered to further strengthen the state's efforts to control disposal.

Senate Bill 403/House Bill 536 (both passed) make the penalties for the improper disposal of infectious waste consistent with the penalties for the improper disposal of hazardous waste. The penalty is increased from $500 to $100,000 per day per occurrence or five years in jail, or both. Additionally, Senate Bill 404/House Bill 536 expand the coverage of the infectious waste laws to include all health care facilities. Two bills, House Bill 301 and House Bill 469 (both failed), would have subjected a person found guilty of improperly disposing of medical waste to a penalty of $1 million or ten years imprisonment or both.

Smoking

The General Assembly considered various smoking bills ranging from smoking bans in hospitals and enclosed public places to discrimination against smokers. House Bill 471 (passed) prohibits smoking in hospitals unless the attending physician authorizes the patient to smoke. House Bill 164 (failed) would have prohibited smoking in all enclosed public places, except in designated smoking areas. Senate Bill 729/House Bill 1239 (failed) would have made it illegal for an employer to refuse to hire or to fire a person for being a smoker or a nonsmoker or to require an individual to abstain from smoking outside the course of employment.

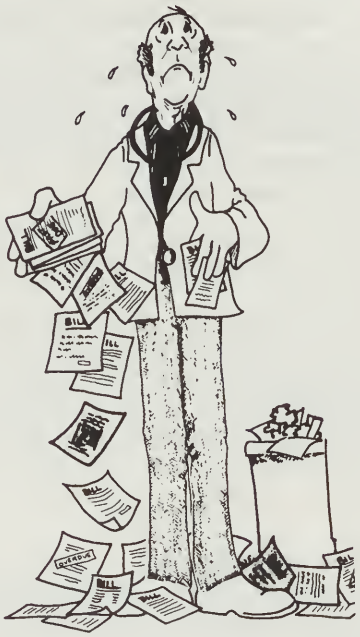
$1,000,000 Celebration

We are pleased to announce that **MED PAY** has funded $1 million in annualized physicians billing since January of this year.

This means no more insurance or collecting hassles for our new clients including:

- Psychiatrist
- Orthopedic Surgeon
- Physical Therapist
- Podiatrist
- Internist



We would be glad to schedule a free consultation to discuss how this timely billing and cash flow (Get paid today for patients seen yesterday and convert your present receivables to cash) program can be of benefit.

Receive Payment Today for Patients Seen Yesterday
Only With

MEDical **PAY**ment

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

Liaison with the Department of Health and Mental Hygiene

Mr. President and Members of the House of Delegates:

The major acivity of the Commitee focused on the proposal by the Department to divert Medical Assistance patients from hospital emergency departments and outpatient clinics. The original proposal included recommendations to:

- eliminate Medicaid payments to hospitals for emergency room services provided to nonemergency patients;
- require hospitals to "divert" nonemergency Medicaid recipients from hospital ER to nonhospital, community based primary care providers;
- Medicaid patient access to hospital outpatient clinics only on referral from a primary care provider; and
- require hospitals to "divert" any Medicaid recipient who comes to an outpatient clinic without a referral.

Med Chi has recognized the problem of primary care services provided in high cost hospital departments. As early as 1975, Med Chi was involved in the Carroll County Study to determine the effects of increased physician fees upon the utilization of services to Medical Assistance patients referred from the emergency department. The Committee has been actively involved in the proposed Medicaid Diversion Project via negotiation with the Secretary and Deputy Secretary of the Department of Health and Mental Hygiene and in close coordination with specialty societies representing physicians who would be adversely affected by the proposed policy. This includes both the Maryland Chapter, American College of Emergency Physicians and the national office of the American College of Emergency Physicians. Additionally, the developing Medicaid proposal has been continuously brought to the attention of the Med Chi Executive Committee and Council, and Michael R. Dobridge MD, President, wrote to all component and specialty societies on July 29, 1988; August 5, 1988; September 2, 1988; January 9, 1989; January 31, 1989 and February 3, 1989 to apprise them of developing issues.

Dr. Israel Weiner speaks on the first six months of The Board of Physician Quality Assurance.

On a proactive basis, Med Chi conducted a survey in September 1988 to measure physician involvement in Medicaid and to obtain opinion as to the effectiveness and administration of the Medical Assistance Program. The majority of respondents indicated that they participate in Medicaid all the time or on a case-by-case basis. The availability and analysis of this information will be helpful in planning activities with the DHMH, the legislature, and other groups regarding future Medicaid initiatives.

Relative to the Medicaid Diversion proposal, testimony (authorized by Council on January 28, 1989) was presented to the Maryland Health Services Cost Review Commission regarding the proposed rate, including the physician component, for Primary Care Access Centers. It was clearly expressed by Med Chi that the provision of the highest quality of care to all Medical Assistance beneficiaries should not be compromised by financial considerations.

After much negotiation, the Medicaid Diversion proposal remains pending with the Administrative, Executive, and Legislative Review Committee (AELR) of the Maryland legislature.

The past year also saw passage of legislation mandating improvements in the Medical Assistance Program. This includes:

1. Reduction of red tape and reimbursement increases for primary care physicians and for physicians practicing in medically underserved areas;
2. Increase of physician manpower in medically underserved areas; and
3. That Med Chi, local medical societies, and the Board of Physician Quality Assurance encourge physicians currently not providing services to Medical Assistance beneficiaries to do so.

In keeping with these recommendations, Med Chi will work through this Committee and component and specialty societies to preserve quality of care for all Medical Assistance beneficiaries. I extend my sincere appreciation to members of the Committee who have given their valuable time to these important activities.

Library and History

Mr. President and Members of the House of Delegates:

In 1988, The Library and History Committee, which was reactivated in 1987, reviewed its goals in the light of rapid technological changes in information processing and gathering. Because of these changes, the contents and services of medical libraries are shifting, with emphasis of the electronic retrieval of data. The original purpose of Library as a repository for textbooks and the Index Medicus, from which one could obtain the latest scientific information has altered. Rapid retrieval of the contents of current scientific journals is now the norm. Bibliographies of medical subjects are obtainable within minutes, and printouts of entire articles can be retrieved in about an hour. Providing this technology and updating Faculty members on how to use it is vital to fruitful use of the library by Med Chi members.

As more and more data accumulate and are stored electronically instead of in book form, the historical publications and artifacts now in the possession of the Library increase in both historic and monetary value and the library staff and Committee must continually re-evaluate their rarity and relevance to the collection and arrange for their preservation and appropriate display.

In 1988, the Library Committee met bimonthly. It identified and addressed itself to the following short and long-term goals.

Short-Term Goals

To establish guidelines for the use of the Krause Rare Book Room, dedicated in September 1988. This beautiful room is open daily for study and (by request) examination of the rare medical books and artifacts it contains. In addition, the room can be rented for social events, the income being used for the upkeep of the books and artifacts.

The Committee and the library staff have established rules for social events including time of availability, allowable number of guests, rules for security, rental fees, and parking arrangements. A list of recommended caterers is being completed, and a brochure is being designed to present these facts to Faculty members.

To investigate the status of the Med Chi historical book and artifact collection originally loaned to the Smithsonian Institute. An extensive review of all available correspondence between Med Chi and the Smithsonian between 1970 and 1981 was made. A synopsis of relevant material keyed to the original letters was prepared. The Library Committee, the Librarian, the Director for Support Services, the Executive Director, and the Faculty's attorney reviewed the material, and all agreed that the collection originally on loan had later been altered to an outright grant in perpetuity and is now the property of the Smithsonian Institute. All the artifacts have been catalogued and appraised. They are insured by the Institute, appropriately housed, and are available to Med Chi on loan.

The Committee has surveyed the various funds that might be appropriately used for preservation and restoration of the library's rare books. The Committee will make recommendations to the Council as to how to finance this activity. The question of restoration has many facets. Restored books lose much of their value. Non-restoration, on the other hand, may lead to loss of a book by total deterioration. The Committee is arranging to meet with a curator from the Eisenhower Library of Johns Hopkins University to get advice on this matter before making any recommendations to the Council and Faculty.

In the matter of preservation of books, the Committee surveyed the various methods of preservation in current use and decided that a relatively inexpensive method of deacidification should be tried. The History of Medicine Archivist and a subcommittee of Dr. Abrams, Dr. Fishbein, and Dr. Wilson have selected a group of books that are duplicates or of minor importance be treated in a trial of the method.

Long-Term Goals

To achieve public recognition of special service of the library. The Committee decided to survey current knowledge of the library's facilities among Maryland physicians and Maryland hospital libraries. Dr. Hamilton prepared a questionnaire that was sent to all

Med Chi archivist Bill Sleeman demonstates the Library's on-line computer capabilities.

Maryland hospitals. There was a 36 percent response, and a follow-up questionnaire will complete the polling. A similar questionnaire was drawn up by Dr. Fricke and will be sent to all Maryland physicians. Dr. Albites is contacting medically related societies in Maryland to see if they would be interested in using the library services. This could be a source of income for the library. When the results of these surveys have been analyzed, appropriate brochures will be prepared to stimulate further interest and utilization of the library's facilities by physicians, medical libraries, and societies.

To advise the Faculty on initiating procedures for publications and celebrations appropriate to the 200th anniversary of the Faculty in 1999. The Committee has identified two projects thus far for the 1999 Bicentennial. The Committee, under the guidance of the Council, plans to mount an exhibit of medical instruments, books, and pamphlets tracing the history of instrumentation and methodology in medicine dating back to the eighteenth century using material from the Smithsonian Institute including artifacts from the Smithsonian Institute's Med Chi collection, now the property of the Smithsonian. With Council approval, a subcommittee is to be formed to update either Eugene Cordell's *Medical Annals of Maryland*, written for the Med Chi centennial in 1899 or the 1950 publication, *Celebration of the Sesquicentennial of the Medical and Chirurgical Faculty of the State of Maryland: 1799 - 1949.*

The Committee extends its thanks to Joseph Jensen, Director of Support Services, for his indoctrinization into the history, structure, and functioning of the library and to Adam Szczepaniak, Library Director, for his cooperation and support of the Committee's goals.

Long-Term Care and Geriatrics

Mr. President and Members of the House of Delegates:

The Committee on Long-Term Care and Geriatrics met five times between September 1988 and May 1989. The Committee has maintained its long-standing commitment to assuring the highest quality of care in long- term care facilities.

The Committee concentrated on Continuing Medical Education by bringing the special problems of the elderly to the attention of physicians and developing educational resources in these areas; and Consumer Information by educating the public about what physicians can offer in the care of the elderly.

In January 1989 the Committee met with representatives from Blue Cross/Blue Shield concerning reimbursement in nursing homes. The Committee is working toward having Medicare reassess the reimbursement rate in Maryland.

In March 1989 the Committee met representatives from Buxbaum-Sacks regarding the new Federal Regulations effective January 1, 1989.

The Committee sponsored a scientific session at the 1989 Annual Meeting of Med Chi, "Thinking Ethically About Nursing Home Transfers," and the response was excellent. In May 1989 the Committee sponsored the Eleventh Annual Meeting of the Medical Directors and Principal Physicians, and over 100 physicians throughout Maryland were invited. Steven Levinson MD, Medical Director, Levindale Hebrew Geriatric Center and Hospital, discussed "Medical Quality Assurance in Nursing Homes."

The Committee looks forward to the coming year and will strive to provide appropriate education to the physicians and the public. The Chairman appreciates the dedication of the Committee members and the Faculty staff.

Managed Care and Third-Party Liaison

Mr. President and Members of the House of Delegates:

The Committee's first initiative this year was to meet with senior executive staff and a member of the Board of Directors of Blue Cross and Blue Shield of Maryland, Inc. Representatives from the Med Chi Executive Committee were also present. Vigorous discussions were held regarding the financial structure of Blue Cross and Blue Shield particularly with respect to financing of managed care programs, sustained losses, experience rating, mandated coverage, and other is-

sues. The concerns of practicing physicians were clearly expressed to this third party carrier. Throughout the year, representatives from the private and Medicare functions of Blue Cross and Blue Shield of Maryland routinely met with the Committee.

The past year saw the expansion of the Committee's charge to involve itself more with health maintenance organizations and other managed systems of health care delivery. At this time, the Committee is working actively with the Maryland Association of HMOs, the Maryland Chapter American College of Emergency Physicians, the Med Chi Committee on Emergency Medical Services, and the Maryland Hospital Association on access of patients enrolled in managed care programs to necessary emergency medical services. The Committee also has worked on behalf of numerous Med Chi members to clarify financial issues following the insolvency of a subcontractor to an HMO in the Baltimore metropolitan area.

In the area of Personal Injury Protection and Workers' Compensation, discussions have been held with the Insurance Commissioner's Office and other authorities regarding the use of private utilization review companies.

Other areas of activity included discussion with third-party payors regarding claims-specific problems brought to our attention by Med Chi members, review of corporate policies, electronic billing systems, and other issues. The Committee works hard to provide a medium for problem resolution, and we are appreciative of the availability of third-party representatives who interact directly with our group.

Maryland Medical Journal

Mr. President and Members of the House of Delegates:

This report covers the period from August 1988 to August 1989, during which *MMJ* underwent some significant production and design changes while maintaining good financial health and growth. Total page count for Volume 37 (1988) was 1,026; issues averaged 86 pages; and distribution was about 7,150 copies per month. Although national pharmaceutical advertising continued the dramatic slide begun in 1986 (their total page count was down 32 percent in 1988 compared to 1987), our local publisher's representative was able to maintain advertising space in *MMJ* at a 38 percent average across the year. Production costs have remained relatively stable, but postal rates continue to increase.

With the August 1988 issue *MMJ* converted to in-house typesetting and formatting. In combination with this changeover, both the August and September issues were off press within three weeks in August. Issues are now mailed a week prior to the cover date instead of mid-month.

Four dedicated issues were produced this year. The December 1988 *MMJ*, Adolescence Today: Youth in Tough Times, compiled by Catherine DeAngelis MD, Director Division of General Pediatrics and Adolescent Medicine, The Johns Hopkins School of Medicine, and Felix Heald MD, Director of Adolescent Medicine, University of Maryland School of Medicine, included nine articles. The January 1989 Legislative Update issue featured four articles as well as a reprint, "A Primer on Tort Reform." The February issue presented fifteen articles Promoting Health and Preventing Disease in Older Adults coordinated by the Center for Health Education, Inc., in cooperation with the Geriatric and Gerontology Education and Research Program of the University of Maryland at Baltimore and Med Chi's Long-term Care and Geriatric Committee. The May issue, devoted to the Physician-Computer Relationship, included seven articles with pertinent information for clinicians contemplating the use of computers in their professional and personal lives.

The November 1988 issue featured four articles from a *festschrift* honoring the medical career of Dr. Thomas B. Connor at the University of Maryland.

The April issue highlighted Raymond M. Atkins MD, Med Chi's President in 1989-1990 (who took office on April 14). This issue ushered in a completely redesigned, more readable, and visually attractive format.

There have been six Editorial Board meetings in this period. At the September 1, 1988 meeting, Dr. James G. Zimmerly, having served as Editor for 11 years, resigned. On September 24 Council, by an award of a commemorative plaque, expressed its appreciation for Dr. Zimmerly's many years of dedicated service. Council appointed Victor R. Hrehorovich MD as Editor for a three-year term. Dr. Hrehorovich had served as Associate Editor with Dr. Zimmerly. Henry P. Laughlin MD was named Associate Editor.

In 1988 there were 106 manuscripts received; three were withdrawn and two were draft proposals. Of the 101 manuscripts reviewed, 79 were accepted, indicating a 22 percent rejection rate. The Board reviewed and revised its mission statement and objectives for Council action. The Board also submitted proposed changes to the Bylaws Committee regarding appointments of Editorial Board members. A tentative Editorial Calendar through April 1991 and a Proposed Cover Calendar through January 1990 have been created.

Two new departments were initiated: (1) PRO Update, a series of articles provided by the Delmarva Foundation for Medical Care, Inc., attempts to define and clarify federal peer review organization requirements and the review-appeals-denials process and (2) Computer Bytes, questions and answers designed to help physicians best use computers in their professional and personal lives.

MMJ continues to invite comments as well as scientific articles. During the 1988 volume year and through July 1989, eight Commentaries, two Editorials, and seven Letters to the Editor have been published.

The second annual "Best Article" awards were presented at Med Chi's semiannual meeting in September 1988. The best practitioners' article, "Heart Transplantation: The Johns Hopkins Experience," by William A. Baumgartner MD, Sharon Augustine RN, and Stephen C. Achuff MD *et al.*, appeared in the September 1987 issue. The best article by residents, "Rocky Mountain Spotted Fever Manifested by Cerebritis and Pneumonitis," by Pradeep Garg MD and David A. Blass MD was in the April 1987 issue.

In April 1989 *MMJ* received an award from the Successful Magazine Publishers Group: an Honorable Mention for excellence in writing, editing, artwork, and design in the Association and Government Publication category.

As always, those associated with the production of the *Maryland Medical Journal* encourage Med Chi members to communicate regularly and often about any and all facets of the publication. The rationale for any editorial decision will be shared with anyone having an interest in *MMJ*.

The Editorial Board and the Managing Editor thank the many outside reviewers of manuscripts who so graciously donated their time and expertise in this important function over the past year. We also appreciate the careful attention of individual department editors who monitor their columns for scientific accuracy and correct citations.

Med Chi Insurance Fund

Mr. President and Members of the House of Delegates:

During the year 1988, the Insurance Fund Board of Directors met six times and conferred on several telephone conferences.

The Hartford group plan of Disability and Major Medical insurance was enhanced by broadening the definition of "Hospital" in the contract. The plan now includes coverage for treatment in Alcoholic Treatment Facilities, Psychiatric Hospitals, Rehabilitation Hospitals, Hospice Facilities, and Ambulatory Surgical Centers, if they meet certain tests stipulated in the contract.

Blue Cross and Blue Shield plan options were revised. A lower benefit, less costly option was added for those members to decrease their expense of Health Insurance.

The largest accomplishment during the year became evident after the end of the year. Med-Mutual changed the renewal dates of all the policies to be effective January 1, beginning in 1989. Policies renewing after June 1988 were written pro rata to December 31, 1988, so that much of the business was renewable January 1. Also, some major competition entered the market in Maryland and were soliciting Med-Mutual policyholders as renewals came up and at year end. The Agency added some staff persons in the property and casualty department to handle the very large volume of activity at year end, with the result that very little business was lost to the competition and more clients were gained, for a net increase in the volume of policyholders through the Med Chi Agency.

It was another successful year for the Agency, and the Faculty and the membership will benefit as a result.

Medicine and Religion

Mr. President and Members of the House of Delegates:

The Medicine and Religion Committee held three meetings during the past year. Activities included:

a. Sponsoring the Prayer Breakfast during Med Chi's 1989 Annual Meeting at which Ann Neale PhD gave a presentation, "A Theological Perspective on the Obligation to Prolong Life."

b. Cosponsoring a session with the Professional Ethics Committee during Med Chi's 1989 Annual Meeting entitled "Cardiopulmonary Resuscitation-Every Patient's Right or Exercise in Futility?"

Medicolegal

Mr. President and Members of the House of Delegates:

The Medicolegal Committee, sponsored jointly by the Medical and Chirurgical Faculty of the State of Maryland, the Maryland State Bar Association and the Baltimore City Bar Association, has continued its work in bringing the medical and legal professions closer together. The Committee rendered advisory opinions on complaints from either discipline and was involved in binding arbitration of a dispute. Again this year, the Committee organized a Medicolegal Hotline staffed by committee members for quick resolution of simple disputes.

In addition, the Committee prepared a survey for use by the medical and legal professions to identify and address current problems. The survey is to be published in the journals of the two professions. The Committee developed Expert Witness Guidelines for adoption by the Council of the Faculty and the Board of Governors of the Maryland State Bar Association.

The Committee also sponsored and presented a program at the Mid-Year Meeting of the Maryland State Bar Association on the effect of recent legislation on malpractice claims. At the April Annual Meeting of the Faculty, the Committee sponsored a session on "Breach of Confidentiality or Duty to Warn? - An Expanding Legal Duty."

The Co-Chairs of the Committee thank the Committee members for their assistance and support during the past year.

Mental Health

Mr President and Members of the House of Delegates:

The Committee on Mental Health held five meetings during the past year. These items were discussed and/or acted upon:

The Bylaws Committee of Med Chi approved the Committee's request for a name change from "The Committee on Emotional Health" to "The Committee on Mental Health," which better identifies the Committee and its activities. A change in the Bylaws also was proposed. The Committee proposed that the last word in the Bylaws, "alcoholism," be changed to "substance abuse." This issue is still pending. Concerns regarding social workers making medical diagnoses continued to be explored. The Attorney General's Opinion, "Referrals of Patients with Psychiatric Illness to Social Workers," prompted the Committee to begin developing guidelines for physicians to use when referring a patient to a social worker. Completion of this endeavor will be a top priority in the coming year.

The Committee considered two bills submitted by Med Chi's Legislative Committee: Senate Bill 78, Health Insurance - Mental Illness - Extension of Termination Date; and House Bill 50, Mental Health Care Providers - Limits on Liability. The Committee supported both bills.

Articles were submitted for future publication in the *Maryland Medical Journal.* A goal of the Committee has been to improve communication and collaboration between psychiatrists and other physicians in Maryland via the column "Today's Psychiatry" in the *Maryland Medical Journal.*

Chairman of the Committee on Alcoholism and Chemical Dependency, N. Joseph Gagliardi MD, was invited to one of our meetings to promote increased dialogue between the two Committees and to learn more about mental health issues that affect both groups.

The Committee, in cooperation with the Maryland Psychiatric Society, cosponsored the presentation "The Psychiatric and Medical Problems of the Homeless" at Med Chi's Annual Meeting. The presentation was well received.

The Committee looks forward to a productive 1989-1990 year. The Co-Chairpersons thanks each Committee member for his/her time and effort in working to improve the quality of care for Marylanders.

Music Medicine Clearinghouse Advisory Board

Mr. President and Members of the House of Delegates:

During the first six months of its existence the Clearinghouse has made a great deal of progress. The Board held two regular meetings and one call meeting, all well attended. A brochure containing a description of the Clearinghouse, services offered, and fees has been completed. A mission statement has been developed to offer guidance in future activities.

In January 1989 the Clearinghouse hosted a visit by Dr. Hunter Fry, an Australian expert in the field of music medicine. A group of local physicians and musicians attended the luncheon and informal discussion afterward. Topics included comparison of treatment successes and failures, total versus partial rest, physician-patient communications, and possibilities for further organizing the local music medicine expertise.

The major effort for the year was participation in the Faculty's Annual Meeting. The Clearinghouse sponsored a session on "Special Problems and Needs of the Instrumental Musicians" by Richard Lederman MD, an internationally known neurologist from the Cleveland Clinic. The lecture was attended by a large number of physicians, allied health professionals, and musicians. The Clearinghouse also had a small table in the exhibit hall to display some of their products and run the music medicine slide show.

The Clearinghouse is exploring the possibility of liaison activities with the International Arts-Medicine Association. The IAMA president, Richard Lippin MD of Philadelphia, visited in March to explain the association's goals. They are hoping to involve a number of organizations in a comprehensive, international approach to information management in the broad field of arts medicine. The Board is awaiting more specific proposals before committing themselves to cooperative efforts.

The Annual Meeting and the overtures from the IAMA have raised a number of issues to be considered next year. A mailing list of interested persons and organizations, both locally and nationally, is being developed. More organized publicity and marketing of Clearinghouse services to libraries, symphonies, music and medical schools, medical specialty societies, music associations, etc. is a major goal. Other ideas being considered include a newsletter, chamber music concerts, and a small conference.

John F. Kressler MD, Member-at-Large

Occupational Health

Mr. President and Members of the House of Delegates:

The Occupational Health Committee met five times during the past year. The Committee continues to study and report on all phases of occupational health, particularly occupational health problems in industry that directly affect the worker. During this year, Committee efforts were focused on the treatment of lower back injuries.

In keeping with this focus, the Committee held a panel session at Med Chi's Annual Meeting, "Caring for the Industrial Back Pain Patient: The Roles of Myofascial Pain and Manipulation." Dr. Stephen M. Levin, Associate Clinical Professor, Orthopaedic Surgery, University of Michigan, and Dr. Norman B. Rosen, FAAPMR, Medical Director, Rehabilitation and Pain Management Associates, were among those who spoke on recent advances in the diagnosis and management of low back pain, highlighting the role of manipulation therapy and soft tissue injection therapy.

Peer Review

Mr. President and Members of the House of Delegates:

This past year changes in the structure of the State of Maryland's physician discipline process have brought many changes in the peer review process. The number of complaints being filed with the new Board of Physician Quality Assurance (BPQA) is greater than ever; however, the BPQA has more staff support including investigators who assist in obtaining information for consideration by review committees. Another significant change is the new requirement that peer review be conducted by physicians of like specialty. As a result, the Committee has required additional support from the Maryland Specialty Societies.

To support actions by the BPQA, the Peer Review Committee is conducting comprehensive practice evaluations in a more timely fashion and with greater completeness. Committee members and staff have devoted much time and energy to improving the peer review system. Much time was devoted to developing a *Peer Review Handbook* to be used as a working guide for uniform peer review across the state. This *Handbook* has been submitted to the BPQA as a source for regulations regarding peer review.

The Committee's activities require the committment of individual members' time to conduct site visits to physicians' offices and/or to review medical records of physicians under review and to prepare detailed written reports of the findings. In some cases, Committee members must testify before the BPQA to support a formal action. The Committee's activities for the past year are reflected in the following statistics:

Cases referred by the CMD/BPQA	47
Physicians interviewed	9
Site visits	18
Medical record reviews	25
Completed reports to the CMD/BPQA	58

These figures do not include cases referred to component societies or single patient complaints referred to another Med Chi committee for review.

Committee members and staff are dedicated to the peer review process and are anxious to continue improving the process for the betterment of the profession and the community.

The Chairman wishes to express his gratitude to all Committee members, to the specialty consultants, and to the Med Chi staff for its able assistance.

Physician/Patient Relations

Mr. President and Members of the House of Delegates:

The Physician/Patient Relations Committee has maintained a vigorous schedule throughout the past year. Improvements have been made in the overall peer review process, and this Committee has made great strides toward completing all investigations within 90 days as required by law. This has been made possible by the increased attention to the process and the dedication of physicians involved in peer review. The Committee continues to investigate complaints involving standards of medical care including Health Claims Arbitration cases and fee disputes. Reports of the Committee's findings and its recommendations are forwarded to the Board of Physician Quality Assurance for consideration and disposition.

The Committee's activities are reflected in the following statistics:

Cases referred by the CMD/BPQA	103
Total interviews	7
Physicians	7
Completed reports submitted to CMD/BPQA	152
Grievances between physicians	2

In addition, Committee members and staff responded to countless inquiries regarding the practice of medicine and related issues. These questions vary in source and complexity and are answered thoroughly and appropriately. This activity fosters an open line of communication that supports and enhances the physician/patient relationship.

Committee members and staff are devoted to the peer review process and are eager to continue improving the process for the betterment of the profession.

The Chairperson expresses her gratitude to all the Committee members and staff for their continued support and efforts to this process.

Physician Rehabilitation

Mr. President and Members of the House of Delegates

The Committee on Physician Rehabilitation has further expanded its umbrella of advocacy by in-

Physician Rehabilitation Advocate Michael Llufrio displays the Physician Rehabilitation Committee calendar.

creasing the number of cases, increasing staff, enhancing services, and improving the loan program.

Last year we were fortunate to hire a Physician Rehabilitation Advocate. Also hired was a new Coordinator of Rehabilitation Follow-up, who came to us after a number of years working for the state directly with the Commission on Medical Discipline and Board of Medical Examiners and with their successor the Board of Physician Quality Assurance.

In September 1988 the Committee sponsored a conference: Professional Rehabilitation: Intervention and Treatment. The keynote speakers, Dr. Vernon Johnson, founder of the Johnson Institute, and Dr. G. Douglas Talbott, are renowned authorities on treating impaired professionals. The conference was well attended and received very positive evaluations from those in attendance.

We are designing and implementing marketing strategies for the Committee. Our brochure and slide show have been improved through redesign and updating. Beginning in January 1989 the services of the Committee have been advertised in the *Maryland Medical Journal*. As a result of these ads, several thousand dollars in donations have been received. These monies have been used to start an endowment to help ensure the ongoing services of the Committee. The advertisements will continue to run in *MMJ* each month. Other means of "getting the message out" are being explored and will be implemented as they become available.

Dr. Louis C. Breschi receives a Certificate of Recognition for his outstanding chairmanship of the Committee of Professional Ethics.

The record-keeping system has been upgraded and restructured with special emphasis given to ease of access to the information enclosed in the record. Using the upgraded record and resources of the Committee has improved substantially our monitoring system and allows us to offer the greatest amount of support to our colleagues under the advocacy of the Rehabilitation Committee.

The Committee loan program has been greatly improved and bad debt decreased as accounts receivable have increased. Bad debt was decreased by nearly $20,000 between 11 August 88 and 13 March 89. During this same period accounts receivable increased nearly $15,000.

Within the next year we look forward to using a secured database to store information about the physicians under our advocacy. This will enable even better access to information for the purpose of statistics, program evaluation, and communication.

Professional Ethics

Mr. President and Members of the House of Delegates:

Members of the Committee on Professional Ethics have participated in various forums and programs to educate the medical community on the ethical responsibilities of physicians in matters pertaining to other physicians and to the public. In this regard, the Committee developed a new ethical opinion on MD or DO Assistant's Fees and revised opinions on Return to Work Statements and Medical Partnerships Between Physicians and Non-Physicians. At the direction of the Council, the Committee revised the policy statements of the Council on Bank Cards, Charging Interest on Past Due Accounts, Discrimination, Professional Courtesy, and Physician Services to Dependents. In addition, the Council

readopted without amendment its policy statement on Compulsory Assessment of Hospital Staff Members and deleted its policy statements on Industrial Medical Referrals and Percentage Fee Charges.

The Committee also developed suggested form letters for guidance when terminating a physician/patient relationship under any circumstance, including the sale of a practice, death, or retirement of a physician.

The Committee cosponsored with the Committee on Medicine and Religion an educational program at the Faculty's Annual Meeting in April, "Cardiopulmonary Resuscitation - Every Patient's Right or An Exercise in Futility?"

The Committee continues to review proposed corporate names for professional associations and corporations.

The Committee is involved in an update of the 1984 *Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland* with anticipated distribution in late 1989.

The Chairman expresses his regard and appreciation to the hardworking and dedicated members of this Committee who continue to give unselfishly of their time to the important work of this Committee.

Professional Review Organization Monitoring

Mr. President and Members of the House of Delegates:

The PRO Monitoring Committee continued to maintain close liaison with the federally designated Professional Review Organization, the Delmarva Foundation for Medical Care, Inc. While the Faculty has neither review power nor legal authority over the PRO, a satisfactory working relationship with the Delmarva Foundation continues to be maintained.

Significantly, the Delmarva Foundation for Medical Care, Inc. entered into a new contractual relationship with the federal government known as the "Third Scope of Work," which took effect April 1, 1989 through March 31, 1992. Under the new scope of work there will be an increase in the involvement of the PRO in physician review and interaction.

On the issues of proposed federal regulations for Denial of Payment for Substandard Quality of Care and Review of Beneficiary Complaints, the Committee developed a position that was approved by the Council and forwarded to the Maryland Congressional Delegation. Essentially, Med Chi's expressed position is that both proposals would be damaging to physician/patient relationships, and that adequate due process must be built into the system including prompt reconsideration of quality denials by physicians in the same medical specialty as the physician whose services are under review. Med Chi also went on record that when reviewing beneficiary complaints concerning quality, PROs should notify the patient that the quality of services does not meet professionally recognized standards *only* if it finds a serious quality problem. In determining whether a serious quality problem exists, PROs should use the same standards they will use for making quality denials: that the care does not meet professionally recognized standards and results in either an actual, significant, adverse effect on the beneficiary or constitutes a gross and flagrant violation of Medicare obligations.

Another area of concern is the issue of Preadmission/Preprocedure Review Requirements for certain elective procedures, which took effect April 1, 1989. Med Chi expressed its concern regarding the timeliness of required notification of physicians by the PRO concerning this federal review requirement.

I wish to take this opportunity to thank R. Lane Wroth MD, Medical Director; Linda Clark, Executive Director; and Jean Murphy, Vice-President for Review for their availability and cooperation.

Additionally, I thank the members of this Committee for their valuable expertise and committment to this work on behalf of all members of the Medical and Chirurgical Faculty of Maryland.

Public Health

Mr. President and Members of the House of Delegates:

During the 1988-89 operational year of Med Chi, the Committee on Public Health exercised its charge to review Med Chi's existing committee structure as it relates to public health and to develop recommendations to improve Med Chi's effectiveness in managing public health issues.

Pursuant to this, the Co-Chairmen of the Committee on Public Health had numerous meetings and developed a series of recommended bylaw amendments that were considered by the House of Delegates on April 12, 1989. Essentially, the proposal would centralize Med Chi's approach to public health, thereby strengthening the Faculty's effectiveness to improve public health services for the citizens of Maryland. The House of Delegates deferred implementation of these recommendations pending further review by the Bylaws Committee and the Committee on Public Health.

Other Committee activities included meetings with the Deputy Secretary of the Department of Health and Mental Hygiene concerning public health initiatives; monitoring of Medicaid Diversion Proposal conjointly with the Liaison Committee with the Department of Health and Mental Hygiene (Co-Chairman, Herman C. Maganzini MD testified in the Legislature [AELR Committee] regarding implications of proposal); reestablished the Subcommittee on Maternal Welfare to act on variations of cesarean section rates in Maryland; the Subcommittee on Sports Medicine assisted the Maryland State Games Commission in planning medical support for amateur athletic competition, June 16-18, 1989; and finally, the Committee heard a presentation from U.S. Army representatives regarding biological defense research program at Edgewood Arsenal and Fort Detrick, Maryland.

Med Chi's Public Relations Assistant Betsy Newman in the lobby at Turf Valley during a brief moment between meetings.

On behalf of the Committee on Public Health, we appreciate the opportunity to participate in this essential area of Med Chi activities.

Public Relations

Mr. President and Members of the House of Delegates

The Public Relations Committee took on several new projects during its 1988-1989 session.

In a joint effort the Public Relations Committee and the Committee on Computers in Medicine developed a special section within the already established Maryland Med Sig computer bulletin board system that provides up-to-date information on issues at Med Chi and the AMA, and news about Med Chi programs and services. Questions or requests for clarification may be directly entered into the system, allowing Med Chi to respond to any issue almost immediately. This new communications system has the potential to increase the flow of information between Med Chi, individual physicians and component society officers. The only equipment necessary to use this system are an IBM compatible computer and a telephone modem.

In January 1989 Med Chi began co-producing a nationally aired version of "Consultation," a one-hour radio talk program coordinated by the Public Relations Committee. "Consultation" is now heard on over 30 radio stations across the country. Subjects discussed on the national program include AIDS, Nutrition, Cancer, Sports Medicine, and Headaches. In addition, a local version of "Consultation" continues to air on WBAL-AM radio on Sunday at 7 a.m.

In March 1989 the Public Relations Committee presented its proposal for a new letterhead and logo to the Med Chi Council. The new stationary was accepted with a few modifications. The new letterhead features the traditional Med Chi Seal next to an updated name and look for the masthead that will now read, "The Medical and Chirurgical Faculty of Maryland." For those unfamiliar with our organization, an explanation of our name, "Maryland State Medical Society," appears at the bottom of the page. Med Chi's FAX number and the address for the Annapolis Office also appears on the new letterhead, which is scheduled to be printed later in 1989 when supplies of the old stationary begin to diminish.

An annual "Award for Excellence in Organized Medicine" was established to recognize the contribu-

tions Maryland medical students make to organized medicine. The award was created to encourage medical students' involvement in organized medicine and to increase Med Chi's visibility at Maryland's medical schools. The Deans of Student Affairs at Johns Hopkins University Medical School, the University of Maryland, and the Uniform Services University of Health Sciences will be asked to nominate a graduating senior who demonstrates outstanding activity in the cause of organized medicine. Nominees must be Med Chi members and, preferably, members of the AMA. All nominations will be subject to review and approval by Med Chi's President. Recipients of the award will receive a plaque presented by a Med Chi representative during their respective graduation ceremonies. For the second year, the Public Relations Committee's postal plate was used to promote Doctor's Day on March 30th. The plate bears a red carnation (the official symbol of Doctor's Day) and was used by the Faculty and several hospitals throughout the state to publicize this special occasion.

In April the Public Relations Committee sponsored the Ninth Annual Photo Contest. Faculty and Auxiliary members entered over 20 photos in both the color and black-and-white categories. All photographs were judged by Stephen Spartana, a professional photographer from Baltimore. First and second prizes were awarded and names of the winners were announced during the House of Delegates Session of the Annual Meeting. Jerrold Post MD won first and second place in the color category. The first place winner in the black-and-white category was David Paul MD and Irvin Wachsman MD won second place in the black-and-white category. All entries in the photo contest were on display during the Annual Meeting.

Certificates of Recognition were presented during the House of Delegates Session of the Annual Meeting to three physicians for their outstanding service and dedication as chairmen of Med Chi committees. President Michael R. Dobridge MD presented certificates to Victor R. Hrehorovich MD, Chairman of the Committee on Hospital Medical Staffs, Louis C. Breschi MD, Chairman of the Committee on Professional Ethics, and Emido A. Bianco MD, Chairman of the Peer Review Committee.

The Public Relations Committee focused attention on the A.H. Robins Award for Community Service by distributing a new handout to describe the award, which resulted in increased nominations over last year. Med Chi's President presented the award during the Annual Meeting to Hiroshi Nakazawa MD of Baltimore.

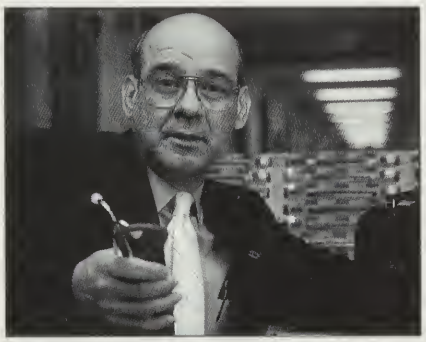
In July 1989 the Public Relations Committee began a monthly advertisement for Med Chi's Speaker's Bureau in the *Maryland Medical Journal.* This advertisement is intended to increase recruitment of physician speakers who are needed to form an organized network of topics and speakers. Physicians in the Speaker's Bureau will be asked to respond to requests from the public and the media for information on their specialty or topic.

The Committee replaced its monthly health clippings packets with daily health clippings from the *Baltimore Sun, The Evening Sun,* and *The Washington Post,* which are distributed to key staff members. The Committee maintains an extensive health clippings file from all Maryland papers, and it is available for use by all Med Chi members.

In May 1989 the Public Relations Committee formed a new Tel-Med subcommittee that will review, update, and approve scripts contained in Maryland's Tel-Med Master Library. The new subcommittee will serve in an advisory capacity to the six Tel-Med programs presently operating in Maryland.

In response to the growing trend in the media to diminish the public image of physicians, the Public Relations Committee submitted a proposal to amend the Article XI, Section 31 of the Bylaws that describes the function and organization of the Public Relations Committee. The amendment, which is under review by the Bylaws committee, proposes that "to enhance the image of physicians" be included as a function of the Public Relations Committee.

The Committee began planning articles for a new Public Relations column in the *Maryland Medical Journal* for submission to the Editorial Board. The purpose of the column will be to provide information to physicians on how to improve patient relations. The column may also include informational bulletins about Med Chi Committee activities and medical issues in Maryland.



The goal of the Public Relations Committee is to create the best possible image for physicians in the eyes of the public. The Committee welcomes comments and suggestions from Med Chi members regarding its activities. As Chairman, I thank the members of my committee whose time and effort have made this a successful year.

Elegant Entertaining

Begin or end a truly special evening in the elegant atmosphere of Med-Chi's historic Kraus Memorial Reading Room 1 block from the BSO. Available for catered functions every day. Please call Pat Marshall at 301-539-0872 for information.

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

Reference

Mr. President and Members of the House of Delegates:

On March 13, 1989, the Reference Committee considered the following resolution:

Resolution 1A/89
Student and Resident Participation

Whereas, The Medical and Chirurgical Faculty of Maryland was among the first state medical societies to establish Student and Resident Component Medical Societies;
Whereas, the Medical and Chirurgical Faculty of Maryland has continued to encourage its student and resident members to participate in its activities including the Council and House of Delegates; and
Whereas, Student and Resident Component Societies will continue to provide new membership vital to a dynamic, growing medical society; therefore be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland continue to involve its student and resident members in appropriate levels of Faculty activities.

The Reference Committee recommends adoption of this resolution.

Resolution 2A/89
Natural Science Ambassador Project

Whereas, The technology and sophistication of modern medicine has evolved through advancements in the various disciplines of the natural sciences;
Whereas, The continued stature of American medicine and technology relies upon the achievements of scientists both present and future;
Whereas, In a recent evaluation of science aptitude, American 17 years old placed near the bottom of a 17 country comparison;
Whereas, 50 percent of Japanese scientists and engineers are under the age of 35, while only 28 percent of their American counterparts are of such age;
Whereas, The classroom can be a vehicle by which to captivate a student's attentions and imagination; and
Whereas, The American Medical Association is developing a project introducing scientist "Ambassadors" into classrooms for the purpose of student enlightenment, with the intention of stimulating interest toward concerns in the Natural Sciences; therefore be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland establish a Natural Sciences Ambassador Project; and be it further
RESOLVED, That project coordination be accomplished through the voluntary involvement of Component Medical Societies with their respective Boards of Education.

The Reference Committee recommends adoption of the above resolution.

Resolution 3A/89
Ophthalmic Surgical Care

Whereas, A surgeon's obligations to a patient do not end with the conclusion of an operation;
Whereas, This physician-patient relationship, unless appropriately terminated by one or both of the parties, continues until ended by the cessation of the medical necessity which gave rise to the relationship;
Whereas, The management of postophthalmic surgical care constitutes the practice of medicine and cannot be managed by other health care practitioners;
Whereas, Postophthalmic surgical care is inseparable from the entire surgical process as it involves monitoring the recovery process, detecting and diagnosing conditions arising during the recovery process, and taking steps to treat postsurgical problems;
Whereas, Ophthalmologists, because of their unique competence to diagnose and treat postoperative ocular pathologic conditions, are the only health care professionals who are fully educated and trained to manage and provide postoperative medical eye care;
Whereas, The American Academy of Ophthalmology believes the provision of postoperative care by nonphysicians represents patient abandonment and is certainly not in the best interest of the patient; and
Whereas, The Maryland Board of Medical Examiners in July 1986 has affirmed that the rendering of postoperative care is the practice of medicine and cannot be legally delegated; therefore be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland asserts that, in keeping with the sound professional practice of medicine, the provision of postoperative medical eye care is the responsibility of the ophthalmologist and can be neither legally nor ethically delegated to a nonphysician.

The Reference Committee recommends adoption of the above resolution.

Subject 4A/89
Women Physicians in Organized Medicine

Whereas, The professional expertise, skills and leadership of women are important to the future of organized medicine;
Whereas, Women are entering the medical field in increasing numbers; and
Whereas, Women physicians have made outstanding contributions to the fields of research and development and clinical medicine; therefore, be it
RESOLVED, That the Medical and Chirurgical

Faculty of Maryland in cooperation with its component societies, actively recruit women members; and be it further,
RESOLVED, That the Medical and Chirurgical Faculty of Maryland encourage women physicians to actively participate in organized medicine through increased committee and other leadership involvement.

The Reference Committee recommends adoption of the above resolution.

Margaret T. Snow MD, Silver Spring

Scientific Activity

Mr. President and Members of the House of Delegates:

The 1988 Semiannual Meeting was held at the Southhampton Princess Hotel, Bermuda, September 14-18, 1988. The 108 attendees rated highly the 10 CME credits offered during the scientific sessions. Contributors to the sessions included James E. Davis MD, President, American Medical Association and James A.C. King MD, President, Bermuda Medical Society, as well as Michael R. Dobridge, President, Med Chi and other Maryland physicians.

The 1989 Annual Meeting was held at the Turf Valley Hotel and Country Club in Ellicott City, April 12-14, 1989. Various specialty societies collaborated in order to increase attendance. This proved to be a successful approach.

Once again, the Committee on Scientific Activity combined some new ideas with some old ones. To emphasize the impact of costs on the quality of health care, the thrust of the Plenary Session centered on "Can We Afford Our Health Care System?" Speakers Edward R. Annis MD, Past President, American Medical Association spoke on "Broken Promises/Increased Challenges," and John Lee Clowe MD, Speaker, House of Delegates, American Medical Association addressed "Challenges to the Medical Profession."

Scientific Activity Committee Chairperson Gary Rosenberg and Marsha Rosenberg chat while waiting in the receiving line.

That evening the Maryland Medical Political Action Committee once again presented the Capitol Steps performing at a cabaret. These brilliant satirists presented their views on topics ranging from President George Bush to the Baltimore Orioles. A hot buffet was served to over 200 physicians, legislators, and spouses.

Since the complimentary lunch served last year was so successful, it was offered on Wednesday and Thursday. The Lunch and Learn session was dropped from the program in order to promote higher attendance in the exhibit areas. Overall, those that participated in the luncheons were pleased with the quality of the food.

An audience of 46 attended the Prayer Breakfast at 7:15 a.m. on Thursday. Even though the attendance dropped from last year, participants enjoyed Dr. Anne Neale's presentation "A Theological Perspective on the Obligation to Prolong Life."

A total of 14 Category I CME credits were offered at the Annual Meeting.

Continuing a policy initiated in 1987, all the Past Presidents and their spouses/guests were given complimentary tickets to the Presidential Banquet. There were eight Past Presidents in attendance. The Presidential Banquet, honoring Michael R. Dobridge MD featured a gourmet meal and dancing to the music of Al Lambert's Moneysworth. Additional entertainment included the Pro Cantare singing group and the Philippine physicians dancing group. As part of the evening's activities, Dr. Dobridge presented plaques to the dancers and to the director of the Pro Cantare. He also presented a plaque of appreciation to Gary L. Rosenberg MD, Chairman, Committee On Scientific Activity. In addition, President Raymond M. Atkins MD presented Dr. Dobridge with a Past-President's plaque. Dr. Dobridge presented Dr. Atkins with a Presidential medallion to be worn during his term of office.

Annual Meeting attendance was lower than last year partly due to moving to a new facility and not sending out a preliminary program. Even though overall attendance was down, the scientific sessions showed an increase over last year. Those physicians attending were pleased with Turf Valley and urged Med Chi to return for future meetings.

The next Semiannual Meeting will be held at the Sheraton Fountainebleau Inn and Spa, Ocean City, Maryland, September 14-16, 1989.

In 1988-89, forty requests were received for cosponsorship by the Faculty for Category I CME credits. Four practice management workshops were offered for physicians and office staff during 1988.

The Committee on Scientific Activity appreciates

the assistance given to make this a successful year and wishes to thank the many individuals who gave of their time and effort.

Gary L. Rosenberg MD, Chairperson

Jack M. Zimmerman MD
Ernest E. Harmon MD
Jose Martinez MD
J. Richard Lilly MD

Mrs. Patricia Marshall, Director of Meeting Services

Small Area Practice Variation

Mr. President and Members of the House of Delegates:

The Committee on Small Area Practice Variation continued its activity to study area-to-area variations in the utilization of medical services. It is a priority of the Committee that such activity fall within the province of physicians and that wherever possible individual physicians, appropriate component and specialty societies, and organized hospital medical staffs be involved so that physicians can appropriately evaluate variations in medical practice.

The Committee's educational function included the development of an article, "What Physicians Should Know about Small Area Variation Analysis," by Kazandjian, Dans, and Scherlis published in the June 1989 *Maryland Medical Journal.* Solicitations have also been made to identified experts in the field for a planned "devoted" issue of the *Maryland Medical Journal* on small area variation analysis. Additionally, the Chairman presented a session during the 191st Med Chi Annual Meeting to educate physicians regarding the growing activity in the study of small area variation and why it is important for physicians to be proactive. Plans are under way for additional educational programs for the next Annual Meeting.

The Committee did involve the Med Chi Subcommittee on Maternal Welfare and the Obstetrical and Gynecological Society of Maryland regarding cesarean section rates and related activities by the Maryland Hospital Association. The involvement of appropriate physician oranizations has been beneficial. Variations in other procedures such as carotid endarterectomy and prostatectomy are also being addressed.

As Chairman, I extend my appreciation to each member of the Comittee for his valuable time and expertise in this Faculty activity.

Specialist Identification

Mr. President and Members of the House of Delegates:

The Committee on Specialist Identification met twice during the past year to carry out its function as the reviewing body for the Board of Physician Quality Assurance in the area of Specialist Identification. At this date, approximately 1,200 applications have been evaluated by the Committee with recommendations to the Board of Physician Quality Assurance.

Application for specialty designation is legally required for all licensed physicians in Maryland. If a physician is certified by the American Board of Medical Specialists, the identification is automatically given by the Board upon confirmation of that credential. If not certified by the American Board of Medical Specialists, the physician must complete an application outlining specific training and experience in the requested specialty.

Much time and effort has been exercised in reviewing applications received thus far. Each application is reviewed thoroughly, fairly, and in compliance with established criteria. Liaison has been satisfactorily maintained with the Board of Physician Quality Assurance members John Lynn MD and Claude Hill MD, who represent the Board for specialist identification.

On behalf of the Committee on Specialist Identification, we appreciate the opportunity to carry on this activity.

Young Physicians

Mr. President and Members of the House of Delegates:

The Committee worked actively to develop progams and to encourage the participation of young physicians in Med Chi and its component societies. By definition, young physicans are licensed physicians under age forty or in practice less then five years.

The Committee reaffirmed its goals to strengthen the Medical and Chirurgical Faculty through increased membership by young physicians. This shall be done by educating young physicians about organized medicine, the political process, and the many issues surrounding medicine at this time. As membership increases we hope to stimulate the involvement of young physicians in leadership roles at the component society and Faculty levels, thereby bringing the unique perspective of young physicians on medical, political, and socioeconomic issues to the medical society.

The Committee conducted a survey of young physician Med Chi members to obtain demographic information and to assess priorities of young physicians in Maryland. The survey response was significant, and tabulation is now under way. Additionally, a Maryland Delegate to the Young Physician Section of the American Medical Association will attend the AMA Young Physician assembly. This year marked the first Med Chi young physician social gathering during the Med Chi's Annual Meeting. Funding for this event was accomplished by the Young Physician Committee, and plans are under way to repeat and improve the event next year. Through these activities, we plan to further develop young physician involvement and resolve to strengthen Med Chi through increased membership and new program initiatives.

For daily office headaches, take what doctors recommend.

The A.D.S. Medical System. It's been tested in medical offices for years and found to be the most effective and affordable remedy for all kinds of office headaches.

You know the headaches.

Mountains of paperwork. Appointment scheduling. Insurance forms and claim submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Now try the most effective and affordable cure.

The A.D.S. Medical System is a proven high performance, easy-to-use system that offers the features you need to fully automate your practice.

- Shortest training period of any system
- Top quality hardware/software service support
- Flexible, expandable multi-user reliability
- The best value available

Call for more information or a free demonstration.

Once you've examined our system, you'll find it's the best available cure for the headaches of managing and operating your practice.

The A.D.S. Medical System. It can make a practice perfect.

Confused?

DHMH DRG HMO

Most people are when it comes to medicine today. Increased communication is the only way physicians can help improve the public's understanding of medicine. In an effort to promote communication, Med Chi is seeking physicians to participate in a Speaker's Bureau.

As a Bureau Speaker, you help strengthen physician's public image by projecting an accurate representation of the goals and values of all Maryland medical professionals.

To become a member of Med Chi Speakers Bureau simply complete the address information, check the appropriate topic(s) listed below, and mail this form to Betsy Newman, Public Relations, Med Chi, 1211 Cathedral Street, Baltimore, MD 21201.

ARMY RESERVE OFFERS NEW FINANCIAL INCENTIVES FOR RESIDENTS IN ANESTHESIOLOGY AND SURGICAL SPECIALTIES

If you are a resident in Anesthesiology, Orthopaedic Surgery, or General Surgery including Neurosurgery, Colon/Rectal, Cardiac/Thoracic, Pediatric, Peripheral/Vascular and Plastic Surgery, the Army Reserve has a new and exciting opportunity for you. The New Specialized Training Assistance Program will provide you with financial incentives while you're training in one of these specialties.

Here's how the program can work for you. If you qualify, you may be selected to participate in the Specialized Training Assistance Program. You'll serve in a local Army Reserve medical unit with flexible scheduling so it won't interfere with your residency training, and in addition to your regular monthly Reserve pay, you'll receive a stipend of $678 a month.

You'll also have the opportunity to practice your specialty for two weeks a year at one of the Army's prestigious Medical Centers.

Find out more about the Army Reserve's new Specialized Training Assistance Program. Call (collect) your U.S. Army Medical Department Reserve Personnel Counselor:

ARMY MEDICINE. BE ALL YOU CAN BE.

Treasurer

Mr. President and Members of the House of Delegates:

The financial books and records of the Medical and Chirurgical Faculty have been audited for the year ended December 31, 1988 by O'Dea and Associates, Certified Public Accountants.

The financial reports reflecting the results of operations for the year 1988 and the financial position of the Faculty at year end are part of this report. The auditors have submitted an unqualified opinion that the financial statements are accurate and conform to generally accepted accounting principles.

The 1989 Budget was approved by Council in January and is presented in this report for your information.

The Faculty investment portfolio was received and is part of the report of the Financial Committee.

Jose M. Yosuico MD, Treasurer

O'Dea & Associates
Certified Public Accountants

The Medical and Chirurgical Faculty
of the State of Maryland
Baltimore, Maryland

We have examined the balance sheet of The Medical and Chirurgical Faculty of the State of Maryland as of December 31, 1988 and 1987 and the related statements of income, expenditures and transfers, and changes in fund balances for the years then ended. Our examinations were made in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the financial statements referred to above present fairly the financial position of The Medical and Chirurgical Faculty of the State of Maryland as of December 31, 1988 and 1987 and the results of its operations and the changes in its fund balances for the years then ended, in conformity with generally accepted accounting principles applied on a consistent basis.

O'Dea & Associates

Notes to Financial Statements, December 31, 1988

Note 1—Summary of Significant Accounting Policies

The Medical and Chirurgical Faculty of the State of Maryland is a nonprofit organization, tax exempt under Section 501 of the Internal Revenue Code.

Marketable securities are carried at cost. Market values at December 31, 1988 and 1987 were $2,376,946 and $2,200,654, respectively.

The Faculty carries its investment in the 100% owned The Med Chi Agency, Inc. at equity. The net assets of the corporation as of December 31, 1988 and 1987 were as follows:

	1988	1987
Current assets	$284,076	$329,541
Fixed assets—net	17,682	13,470
	301,758	343,011
Current liabilities	198,899	94,972
	$102,859	$248,039

Fixed assets of the plant fund, other than personal property, are recorded at cost. Portraits were appraised as of December 31, 1963 at $65,000 an increase of $51,000 over prior years. All other personal property was appraised as of December 31, 1949. Depreciation on fixed assets is not provided. A schedule of fixed assets follows:

	1988	1987
Real Estate		
1209–1215 Cathedral Street		
Land and building	$ 110,636	$ 110,636
Improvements	543,035	543,035
1205–1207 Cathedral Street and 1204 Maryland Avenue		
Land and buildings	2,134,752	1,971,855
Improvements	188,296	188,296
224 Main Street, Annapolis		
Land and building	6,260	—
	2,982,979	2,813,822
Other		
Library books, journals	231,370	231,370
Office and library—fixtures, antiques and museum pieces	87,570	77,349
Portraits—appraised value	65,000	650,000
	383,940	187,719
	$3,366,919	$3,187,541

Fixed assets of the general fund are recorded at cost and depreciated using the straight-line method over their estimated useful lives for assets acquired prior to 1981, using the accelerated cost recovery system for assets acquired after 1980 and the modified accelerated cost recovery system for those acquired after 1986.

	December 31, 1988	December 31, 1987	Life in Years
Automobiles	$ 32,000	$ 32,000	3
Office equipment and furniture	290,282	231,435	5–10
Total cost	322,282	263,435	
Less—accumulated depreciation	235,324	186,739	
	$ 86,958	$ 76,696	

Provision for depreciation charged to operations for the years ended December 31, 1988 and 1987 was $48,585 and $51,714, respectively.

Note 2—Pension Plan

The Faculty has a noncontributory pension plan covering substantially all its employees. Pension contributions for the current year and prior year were $91,832 and $61,295 respectively, which includes amortization of prior service cost over 20 years. The Faculty's policy is to fund pension costs accrued. Actuarially determined pension costs are funded on an annual basis by the Frozen Initial Liability method with initial accrued liabilities computed under the Entry Age Normal Cost method. A comparison of accumulated plan benefits and plan net assets for the Faculty is presented below:

	1988	1987
Actuarial Present Value of Accumulated Plan Benefits		
Vested	$662,369	$730,298
Nonvested	103,199	121,276
	$765,568	$851,574
Net assets available for benefits	$897,015	$941,334

The assumed rate of return used in determining the actuarial present value of accumulated plan benefits was 6.5% for both 1988 and 1987. The fund's assets as of April 1, 1988 and April 1, 1987 exceeded the vested benefits by $234,646 and $211,036, respectively.

Note 3—Related Parties

The Medical and Chirurgical Faculty of the State of Maryland owns the stock of the Med-Chi Agency, Inc. The Faculty leases office space to the Agency under a month-to-month lease. Lease payments from the Agency were $18,246 and $14,003 for 1988 and 1987, respectively. Additionally, the Faculty performed certain management and accounting services for the Agency; income for these services was $105,000 in 1988 and $100,000 in 1987.

Proposed Budget: Estimated Income 1989

	Budget 1988	Projected Actual Thru Dec. 31, 1988	Budget 1989

Total Expenses	$ 2,139,900	$ 2,317,051	$2,385,500

A. Travel: Includes attendance at the following meetings:
Six delegates, six alternates, President, President-elect, and staff to attend.
1. AMA Annual Meeting - Chicago, June
2. AMA Interim Meeting - Hawaii, December

President, President-elect, Council Chairman to attend AMA Leadership Conference, Chicago.

President attends neighboring medical societies:Delaware, Pennsylvania, Virginia, West Virginia, New Jersey, and District of Columbia.

Chief Executive Officers - AAMSE meeting, Georgia AAMSE Annual Conference, California

Officers and staff travel throughout the state for various component society meetings, other official business in the state, and regional and national meetings as determined on an individual basis..

B. Library: The cost of supplics, travel, memberships, copying, and other office expenses will be paid from Library earnings. Library salaries and benefits are included in the Salary and Employee Benefits items. Journal subscriptions, books, and book maintenance are paid from special designated funds.

C. Annual & Semiannual Meeting: New expenditure items of over $5,000 for these meetings (exclusive of pass-through items) to be approved by the Executive Committee or Council. Arrangements and costs for Presidential Banquet and other social events to be cleared by Executive Director.

AXID®

nizatidine

Enhances compliance and convenience

Patients appreciate Axid, 300 mg, in the Convenience Pak

In a Convenience Pak survey (N = 100)[1]

- 100% said the directions on the Convenience Pak were clear and easy to understand
- 93% reported not missing any doses

Pharmacists save time – at no extra cost

- The Convenience Pak saves dispensing time and minimizes handling

The Convenience Pak promotes patient counseling

- Pharmacists dispensing the Axid Convenience Pak can encourage compliance and continued customer satisfaction

Convenience Pak is available at no extra cost

AXID®

nizatidine capsules

Brief Summary

Consult the package literature for complete information.

Indications and Usage: Axid is indicated for up to eight weeks for the treatment of active duodenal ulcer. In most patients, the ulcer will heal within four weeks.

Axid is indicated for maintenance therapy for duodenal ulcer patients at a reduced dosage of 150 mg h.s. after healing of an active duodenal ulcer. The consequences of continuous therapy with Axid for longer than one year are not known.

Contraindication: Axid is contraindicated in patients with known hypersensitivity to the drug and should be used with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General* — 1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Because nizatidine is excreted primarily by the kidney, dosage should be reduced in patients with moderate to severe renal insufficiency.

3. Pharmacokinetic studies in patients with hepatorenal syndrome have not been done. Part of the dose of nizatidine is metabolized in the liver. In patients with normal renal function and uncomplicated hepabc dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests — False-positive tests for urobilinogen with Multistix® may occur during therapy with nizatidine.

Drug Interactions — No interactions have been observed between Axid and theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450-linked drug-metabolizing enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increases in serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility — A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice; although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy — Teratogenic Effects — Pregnancy Category C — Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus and at 50 mg/kg it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizabdine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers — Studies conducted in lactating women have shown that <0.1% of the administered oral dose of nizatidine is secreted in human milk in proportion to plasma concentrations. Caution should be exercised when administering nizatidine to a nursing mother.

Pediatric Use — Safety and effectiveness in children have not been established.

Use in Elderly Patients — Ulcer healing rates in elderly patients are similar to those in younger age groups. The incidence rates of adverse events and laboratory test abnormalities are also similar to those seen in other age groups. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of nizatidine included almost 5,000 patients given nizatidine in studies of varying durations. Oomestic placebo-controlled trials included over 1,900 patients given nizatidine and over 1,300 given placebo. Among reported adverse events in the domestic placebo-controlled trials, sweating (1% vs 0.2%), urticaria (0.5% vs < 0.01%), and somnolence (2.4% vs 1.3%) were significantly more common in the nizatidine group. A variety of less common events was also reported; it was not possible to determine whether these were caused by nizatidine.

Hepatic — Hepatocellular injury, evidenced by elevated liver enzyme tests (SGOT [AST], SGPT [ALT], or alkaline phosphatase), occurred in some patients and was possibly or probably related to nizabdine. In some cases, there was marked elevation of SGOT, SGPT enzymes (greater than 500 IU/L) and, in a single instance, SGPT was greater than 2,000 IU/L. The overall rate of occurrences of elevated liver enzymes and elevations to three bimes the upper limit of normal, however, did not significantly differ from the rate of liver enzyme abnormalities in placebo-treated patients. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular — In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS — Rare cases of reversible mental confusion have been reported.

Endocrine — Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to Axid. Impotence and decreased libido were reported with equal frequency by patients who received Axid and by those given placebo. Rare reports of gynecomastia occurred.

Hypersensitivity — As with other H_2-receptor antagonists, rare cases of anaphylaxis following administration of nizatidine have been reported. Because cross-sensitivity in this class of compounds has been observed, H_2-receptor antagonists should not be administered to individuals with a history of previous hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Hematologic — Fatal thrombocytopenia was reported in a pabent who was treated with Axid and another H_2-receptor antagonist. On previous occasions, this patient had experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental — Sweating and urticaria were reported significantly more frequently in nizabdine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Other — Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizabdine administrabon have been reported.

Overdosage: Overdoses of Axid have been reported rarely. The following is provided to serve as a guide should such an overdose be encountered.

Signs and Symptoms — There is little clinical experience with overdosage of Axid in humans. Test animals that received large doses of nizatidine have exhibited cholinergic-type effects, including lacrimation, salivation, emesis, miosis, and diarrhea. Single oral doses of 800 mg/kg in dogs and of 1,200 mg/kg in monkeys were not lethal. Intravenous median lethal doses in the rat and mouse were 301 mg/kg and 232 mg/kg respectively.

Treatment — To obtain up-to-date information about the treatment of overdose, a good resource is your certified regional Poison Control Center. Telephone numbers of certified poison control centers are listed in the *Physicians' Desk Reference (PDR)*. In managing overdosage, consider the possibility of multiple drug overdoses, interaction among drugs, and unusual drug kinetics in your patient.

If overdosage occurs, use ot acbvated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance.

Additional information available to the profession on request.

Henry P. Laughlin MD, Frederick, recently was honored in Kentucky by the faculty of the University of Louisville School of Medicine. Dr. Laughlin has served the University as their Distinguished Visiting Professor of Psychiatry and the Behavioral Sciences since July 1974. At the beginning of the Medical School's Grand Rounds the Departmental Chairman Professor John J. Schwab MD assisted by former Chairman and World War II US Navy colleague William K. Keller MD formally conferred upon Dr. Laughlin an official plaque of commendation inscribed to *Henry P. Laughlin MD, in respect for your many National Achievements and in grateful appreciation for your 15 years of service to the Department of Psychiatry and Behavioral Sciences, University of Louisville School of Medicine, 1974-1989.*

* * *

Ira T. Fine MD, Baltimore, recently was appointed Chief of Rheumatology at Sinai Hospital. Dr. Fine received his training in Internal Medicine at the University of Maryland in Baltimore and subsequently received Fellowship training in rheumatology at The Johns Hopkins Hospital. Upon completion of his Fellowship he served as Chief Resident in Internal Medicine at University of Maryland Hospital. An instructor in medicine at The Johns Hopkins School of Medicine, Dr. Fine plays an active role in the teaching programs at both Sinai and The Johns Hopkins Hospital.

* * *

On July 1, *Leon E. Kassel* MD, Baltimore, was named Interim Physician in Chief at Sinai Hospital. He will also head the Division of General Internal Medicine.

Past-president of Med Chi (1987-1988) and former President of the Baltimore City Medical Society, Dr. Kassel served on the Maryland Commission on Medical Discipline, on the Governing Council of the Central Maryland Health Systems Agency, and as Chairman of the Board of Directors of the Maryland Foundation for Health Care, the initial PRO for the state of Maryland.

After graduation from the University of Virginia Medical School, Dr. Kassel has practiced in Baltimore (with the exception of two years in the US Air Force) and is Associate Chief of the Deparment of Medicine, Director of the Ambulatory Medicine Program at Sinai, as well as in the private practice of Internal Medicine. Additionally, he is an assistant professor in the Department of Epidemiology and Preventive Medicine at the University of Maryland Medical School and an instructor in Medicine at The Johns Hopkins School of Medicine.

G. Lee Russo MD, Baltimore, has been elected president of the medical staff at Mercy Medical Center. Dr. Russo, who maintains a private practice in neurosurgery, is a graduate of the University of Maryland School of Medicine. He conducted his internship at Mercy Medical Center and his residency in neurosurgery at University Hospital.

* * *

Maryland Orthopedic Society

John Kensora MD, Chief of the Division of Orthopedic Surgery at the University of Maryland Hospital, has been elected president of the Maryland Orthopedic Society for 1989-1990. President-elect is *Stuart Winakur MD*, and the secretary-treasurer (elected for a two-year term) is *George Brouillet MD*; both are in the private practice of orthopedic surgery.

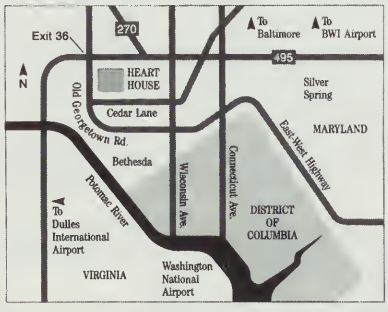
* * *

Montgomery County Medical Society

Cheryl E. Winchell MD, a Gaithersburg family practitioner, has assumed the presidency of the 1,400-member Montgomery County Medical Society. After graduation from the Case Western reserve School of Medicine, an internship at the University of Virginia, and a residency at Grady Memorial Hospital in Atlanta, Dr. Winchell came to the Washington metropolitan area to begin her private practice in family medicine.

No newcomer to medical leadership, Dr. Winchell undertakes the highest office in the MCMS after completing a two-year term as Chief of Staff of Shady Grove Adventist Hospital. In addition to her busy practice, she provides medical care to the homeless at the Gude Drive Men's Shelter.

Other medical society officers are *Jeffrey F. Witte MD*, president-elect; *Lawrence H. Fink MD*, immediate - past-president; *Peter B. Sherer MD*, vice-presdient; *Ronald J. Orleans MD*, secretary; and *William W. Mullins, Jr., MD*, Treasurer. ■



Heart House Learning Center

The American College of Cardiology has been providing continuing medical education to cardiovascular specialists for over 15 years. Attending programs at the Heart House Learning Center is a unique and convenient way of keeping abreast of the latest advances in cardiovascular medicine.

Continuing medical education is imperative for today's medical community and the Learning Center offers an extraordinary and stimulating environment for you to continue your medical education.

The Classroom at Heart House is equipped with 69 Learning Center Chairs, each of which is fitted with a television monitor for viewing videotapes, slides and graphs; a computer response system for evaluating participants' progress; and a tape recorder jack for taping various aspects of the program. The Classroom itself houses, among other things, satellite transmission capability for experiencing actual procedures, as they happen, without leaving your individual learning station. The size of the Classroom affords you an exceptional opportunity to interact with the faculty as well as your fellow participants.

Heart House, the national headquarters of the American College of Cardiology, has been located in Bethesda, Maryland for over 10 years. Its proximity to the National Institutes of Health, the National Library of Medicine and downtown Washington, D.C. has proven to be very beneficial to those attending Learning Center programs.

For more information on the programs being offered at Heart House, please call the Learning Center at 1-800-253-4636 ext. 241 (in Maryland or outside the United States, 1-301-897-5400).

"How can we physicians be assured we're getting the best answers to our malpractice insurance needs when most of us don't even know if we're asking the right questions?"

Metropolitan Imaging Center (MIC) is a state of the art diagnostic imaging facility with centralized services and the latest in diagnostic equipment. The Center is staffed by highly qualified, board certified radiologists and registered technologists with specialized training in neuroradiology, computed tomography and ultrasonography.

MIC offers physicians a wide range of diagnostic and support services. Our facility is bright, cheerful and conveniently located with free, easily accessible parking. Our personnel are trained to help alleviate patient anxieties and inconvenience, providing prompt, courteous scheduling and sensitive counseling.

We provide results of diagnostic findings within 24 hours, with immediate primary physician notification of acute findings, allowing us to provide immediate follow-up and alternative studies. Emergency studies are also welcome.

MIC also offers additional physician support through an informative monthly newsletter and informal educational conferences.

License Registration Renewal

Physicians whose surnames begin with the initials **M through Z** must renew their license registrations in September. The Board of Physician Quality Assurance began mailing renewal information in the middle of July.

Physicians who have not received the renewal information by the second week in August should contact the Board to get the information necessary for renewals before **their licenses expire on September 30, 1989.** Those who have not renewed their license by that date will not have a current license, and their license must be renewed before they may resume practicing in Maryland.

It is the physicians' responsibility, by law, to communicate with the Board of Physician Quality Assurance concerning renewal of their licenses if, for some reason, they do not receive the renewal application.

Physicians may contact the Board by writing to

PO Box 2571, Baltimore, MD 21215-0002
or by calling 301-764-4777

William H. Dorrill, Executive Director

THE STRUGGLE FOR INDEPENDENCE ISN'T ALWAYS FOUGHT IN SOME FAR-OFF COUNTRY.

At Bryn Mawr Rehabilitation Hospital
We Face The Battle Everyday...
And We're Winning.

Over the last ten years, the Bryn Mawr Brain Injury System has made great strides working closely with physicians, nurses and therapists to provide cognitively challenged patients with a vehicle for independence.

By mapping out a carefully planned strategy and implementing our renowned continuum of care, BMRH maximizes an individual's potential by starting at the beginning from the most basic levels of rehabilitation to re-entry into the community. BMRH's professionals are dedicated to helping brain injury patients win ground in the battle they must fight.

Ten years of successfully fighting for our patients' independence has given us the experience and insight to see a future that promises exciting advancements in brain injury rehabilitation.

A DECADE OF ACHIEVEMENT
Bryn Mawr Brain Injury System

Complete information on the Bryn Mawr Brain Injury System is now available.

VASOTEC®

(ENALAPRIL MALEATE | MSD)

Contraindications: VASOTEC® (Enalapril Maleate, MSD) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Heart failure patients given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See DOSAGE AND ADMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in heart failure patients), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASOTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See DOSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (> 5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patients, but was not a cause for discontinuation.

Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions*.)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and DOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation of both drugs. Although a causal relationship has not been established, it is recommended that caution be exercised when lithium is used concomitantly with VASOTEC and serum lithium levels should be monitored frequently.

Pregnancy—Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies in pregnant women. VASOTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 298 / patients.

Hypertension: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

Heart Failure: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); cardiac arrest; pulmonary embolism and infarction; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis or cholestatic jaundice, melena, anorexia, dyspepsia, constipation, glossitis.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and DOSAGE AND ADMINISTRATION), prostate hypertrophy.

Respiratory: Bronchospasm, rhinorrhea, asthma, upper respiratory infection.

Skin: Herpes zoster, pruritus, alopecia, flushing, photosensitivity.

Other: Muscle cramps, hyperhidrosis, impotence, blurred vision, taste alteration, tinnitus.

A symptom complex has been reported which may include fever, myalgia, and arthralgia; an elevated erythrocyte sedimentation rate may be present. Rash or other dermatologic manifestations may occur. These symptoms have disappeared after discontinuation of therapy.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation of therapy in 1.9% ot patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g % and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, if possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) If the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions*.)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASOTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance >30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤30 mL/min (serum creatinine ≥3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum ot 40 mg daily.

Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions*.) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range tor the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinicat Effects*.) Dosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Heart Failure Patients with Renal Impairment or Hyponatremia: In heart failure patients with hyponatremia (serum sodium <130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure*, WARNINGS, and PRECAUTIONS, *Drug Interactions*.) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

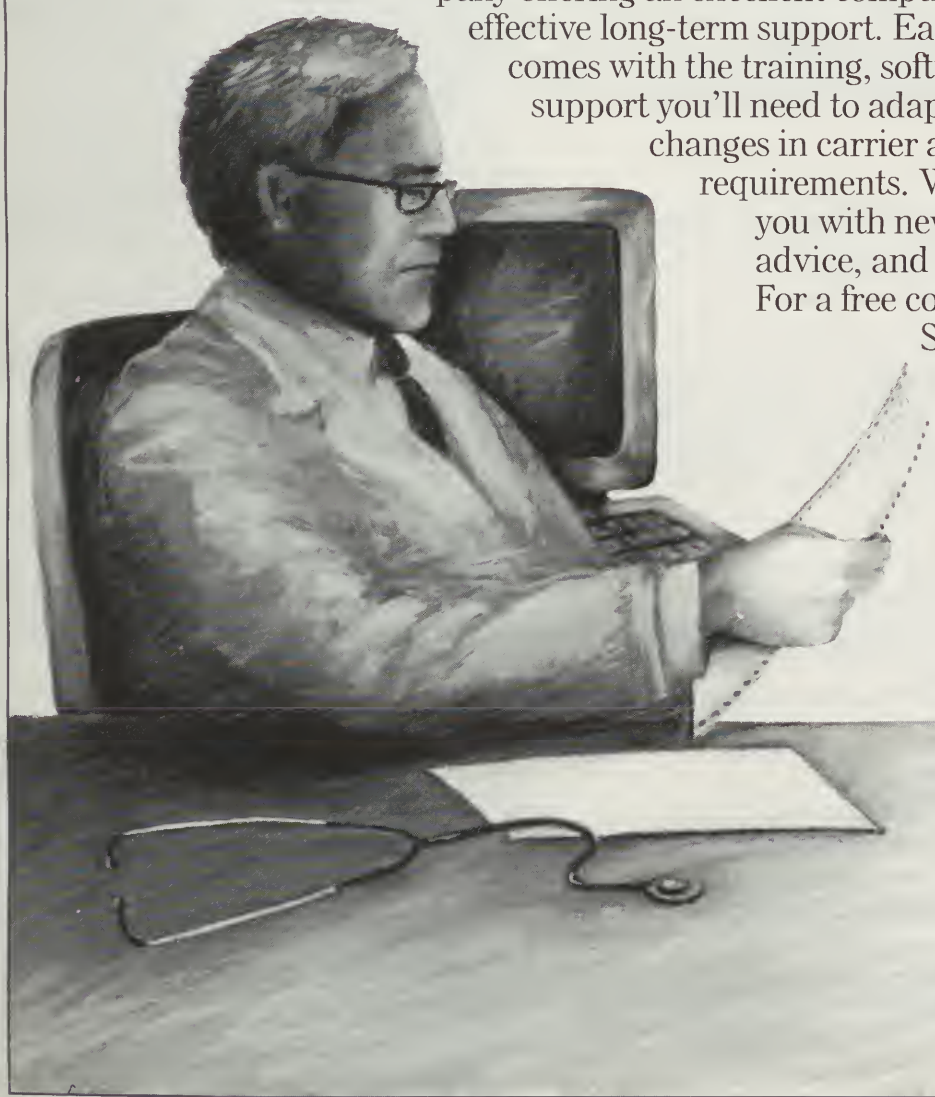
Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.

Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.



Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

Treat your practice with the same care you give your patients.

With billing getting more complicated every day, more physicians are depending on computers to streamline the billing process and maintain cashflow. But without strong customer support, computers can aggravate problems instead of solving them.

That's why you need Sentient—a solid local company offering an excellent computer system with effective long-term support. Each Sentient system comes with the training, software and the ongoing support you'll need to adapt to the latest changes in carrier and regulatory requirements. We're always there for you with new enhancements, advice, and to answer questions. For a free consultation call Sentient today.

A Choice.

Just what the doctors ordered.

What's right for a colleague is not necessarily right for you. That's why Princeton Insurance Company now offers three options to let you build an insurance program tailored to your individual needs:

- Our exclusive *Occurrence Plus* -- the best coverage available from any company.
- Our new *Claims Made Advantage* --- a cost effective way to make the transition to *Occurrence Plus.*
- *Claims Made* -- the lowest cost coverage available today.

The *Claims Made Advantage* and *Claims Made* options let you transfer from another insurer's claims made policy into Princeton's programs without a "tail" or "prior acts" charge.

To find out more about these choices, call one of the independent insurance agents who represent Princeton.

ARTICLES

Women and Organized Medicine: A Call for Action 720
Just as women have assumed the responsibilities of their role in care of patients, they must also contribute to shaping the role of the physician and the future of medicine.

Hospitalized Head-Injured Patients in Maryland: Incidence and Severity of Injuries 725
Ellen J. MacKenzie PhD, Sharon L. Edelstein ScM, and James P. Flynn MD, MPH
Hospital discharge data collected from all acute care hospitals in Maryland were used to examine severity-specific rates of hospitalized head injuries in 1986. Evidence that the rate of hospitalization for head injury may be increasing underscores the importance of head injury as a major public health problem in Maryland.

Case Report: An Unusual Vibrio Infection 735
John B. MacGibbon MD
Nonclassical vibrio infections are being better diagnosed; many of the newer vibrio infections are being better recognized because of more selective culture methods. These infections pose a risk to individuals who play and work in warm coastal waters as well as to those who eat raw or partially cooked seafood.

A Transient Granulocyte Killing Defect Secondary to a Varicella Infection 739
Carol A. Blank MD, James E. Nagel MD, William H. Adler MD, and Fred J. Heldrich MD
A varicella infection in a previously healthy young girl was complicated by bacterial sepsis, arthritis, and osteomyelitis in multiple locations. The mechanism responsible for secondary bacterial infections following varicella may be due to transient defects in granulocyte function.

Cardiac Transplantation in a Regional Center: Goals and Results at Two Years 745
Nelson A. Burton MD; Edward A. Lefrak MD; John A. Miller MD; Linda Ohler RN, MSN; and Mary Beth Foehring RN
Cardiac transplantation moved from the realm of an investigational procedure to a therapeutic modality in the early 1980s. Close follow-up is required to monitor for rejection, infection, and other late complications. Improved patient access to the transplantation center allows enhanced care by the original transplant team.

Case Report: Hepatic Actinomycosis 751
Neil D. Goldberg MD, William C. Anthony MD, Michael C. Yen MD, and Shoab Hashmi MD
Primary hepatic actinomycosis is seldom seen. Treatment with high-dose parental penicillin for prolonged periods is recommended. Concomitant surgical drainage has been recommended, but the nonoperative success reported suggests surgical drainage is not essential to the treatment.

Information for Authors

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program. At your request, *MMJ* will return your disk after your article is published or if the manuscript is not accepted.

Include full name of author(s) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double spaced and numbered consecutively as they appear in text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal jEditors (available through the *Annals of Internal Medicine*).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the author and *MMJ*.

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Can One Insurance Agency Handle All Of Your Policies?

Contemporary Insurance Services:

* Is prepared to advise you concerning all malpractice insurers and can place your coverage with any company
* Carries very low cost term insurance and high-grade universal and whole life products
* Carries excellent disability, overhead and buy-sell products with liberal policy definitions and competitive rates
* Carries excellent health insurance products
* Carries excellent office liability products

Contemporary Insurance Services is one of the largest brokers of malpractice insurance to Maryland physicians. Many of our clients rely on us for all of their insurance needs. Let us show you why many of our clients prefer to handle all of their insurance needs through one agent.

In today's market, you need an insurance broker you can rely on. For more information, complete and return:

SEPTEMBER 1989
Selected Communicable Diseases in Maryland in 1988 (Concluded)

ROCKY MOUNTAIN SPOTTED FEVER (26)

0.6/100,000 (U.S. - 0.3/100,000)

Rocky Mountain spotted fever cases were reported from 13 counties, with Caroline County reporting the highest number of cases (5). Three cases each were reported from Talbot, Queen Anne's, and Harford counties, 2 cases each from Dorchester and Washington counties, and a single case was reported in Baltimore City, Baltimore, Cecil, Howard, Montgomery, Prince George's and St. Mary's counties. All cases had onset of illness between April and October (Figure 7).

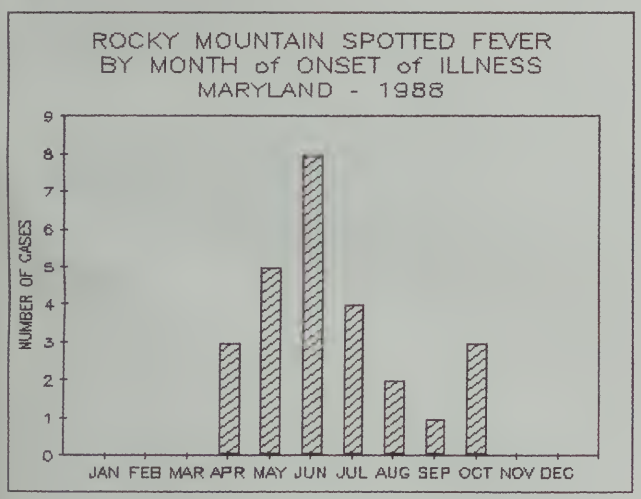

Figure 7

The male to female ratio was 1:1. The age range was 4 to 74 years, (mean 30.5 years). Twenty-three (88.5%) were white.

Nearly all patients had fever (84.6%), headache (76.9%) or rash (73%), although only 9 (34%) had a rash on the soles or palms. Eighteen (69.2%) cases were reported to have been hospitalized. Eighteen (69.2%) cases had a tick bite within 14 days of onset of illness, 6 (23.1%) had been in a known tick-infested area, and 2 (8.7%) reported no known exposure to ticks.

Twenty one (80.8%)cases were confirmed with laboratory results, 1 case was considered a probable case, and 4 were not confirmed.

Treatment included tetracycline or chloramphenicol in 22 of the 25 cases for which treatment information was provided. One case received no treatment. One patient died within 24 hours of hospitalization; all other reported cases made a good recovery.

RUBELLA (2)

0.04/100,000 (U.S. - 0.09/100,000)

Two cases of serologically - confirmed rubella were reported in 1988. One of the reported cases was an 18 month old infant, whose MMR vaccination had been deferred 3 months earlier due to illness; the other patient was a 32 year old male. In both cases the source of infection was not identified. No pregnant, susceptible women were known to have been exposed to the patients.

SALMONELLOSIS (1617)

35.3/100,000 (U.S. - N.A.)

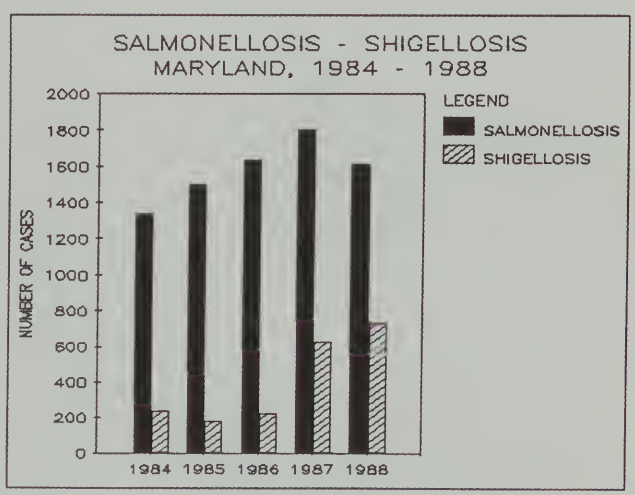

Figure 8

Figure 8 shows the number of cases of salmonellosis reported in Maryland over the past five years. More than half (51.2%) of the cases in 1988 had onset in June through September, the peak month for salmonellosis was August with 288 (17.8%) cases. One-third (33.0%) of the cases were less than 5 years of age, including 18.1% who were younger than 1 year (the group

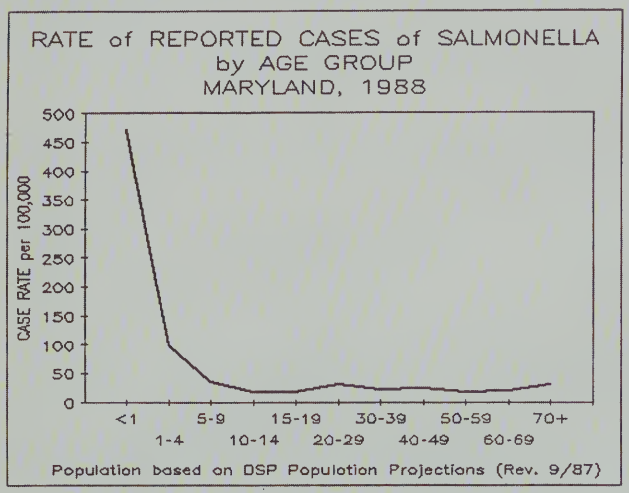

Figure 9

with the highest incidence rate, 469.8/100,000) (Figure 9). An additional 24.6% were between 20 and 39 years old .

Twenty one salmonellosis outbreaks (involving 436 persons) occurred in June through December, in Baltimore City, Baltimore, Cecil, Charles, Harford, Montgomery and Prince George's counties. Eight outbreaks were foodborne. Others involved 3 child care centers, 3

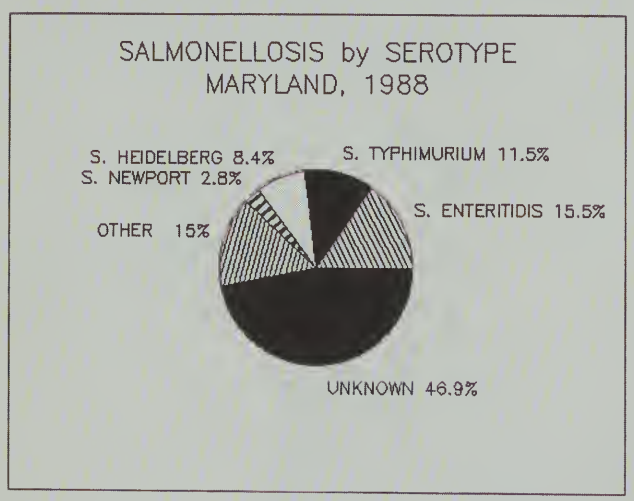

Figure 10

nursing homes, 2 hospitals or health care facilities, and 5 other establishments.

Serotypes of reported isolates are depicted in Figure 10.

SHIGELLOSIS (736)

16/100,000 (U.S. - N.A.)

There has been a dramatic rise in the number of shigellosis cases reported over the past two years (Figure 8). The peak month of onset for shigellosis was May with 94 (12.8%) cases, most cases occurred between January and August (median, 79 cases per month). During 1988, in addition to a higher background rate of shigellosis, 7 outbreaks occurred in Baltimore City, Anne Arundel, Baltimore, Montgomery and Washington counties, with a total of 48 cases; 3 involved food services, 2 involved child care centers and 1 involved a health care facility.

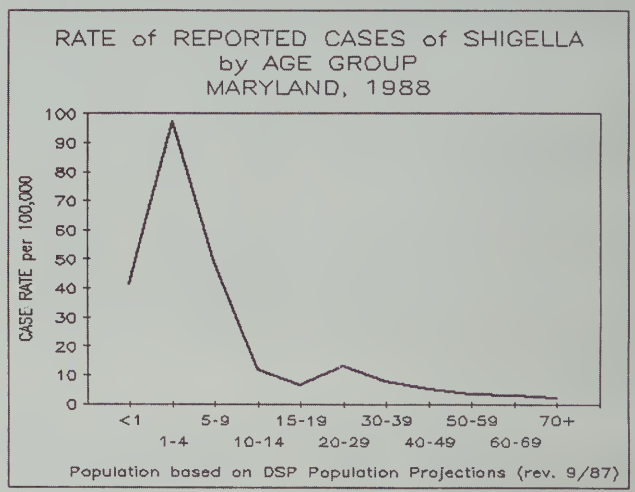

Figure 11

The age distribution of the cases was as follows: 26 (3.6%) were less than 1 year of age, 239 (32.9%) were 1 to 4, 133 (18.3%) were 5 to 9, 58 (8.0%) were 10 to 19 years of age, 222 (30.5%) were adults, and the age of 49 (6.7%) was unknown. Case rates by age are shown in Figure 11.

SYPHILIS (689)

15.0/100,000 (U.S. - 16.5/100,000)

For the calendar year ending December 31, 1988, reported cases of primary and secondary (P&S) syphilis continued the escalating trend described in 1987 (Figure 12). There was an

overall increase for the State of Maryland of 16.0%. While the number of cases reported in Baltimore City decreased by 17.9%, the other jurisdictions in the State reported an increase of 66.7%. P&S syphilis cases in Prince George's County alone rose by 118.0%. In 1987, it was recognized that these syphilis rates are affecting the young, heterosexual, urban population and this problem has persisted in 1988. Unfortunately, as these trends continue and young women of childbearing age become infected, the predicted increases in congenital syphilis follow. There were two cases of congenital syphilis reported in 1987 as compared

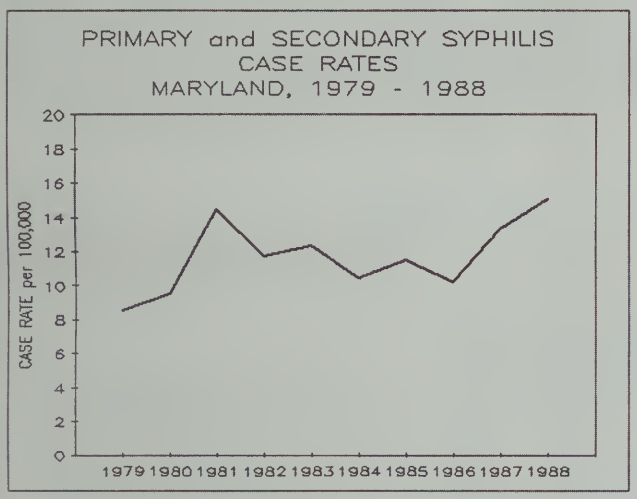

Figure 12

with seven cases reported in 1988. (N.B. Between January and June 1989, 8 confirmed cases of congenital syphilis have been reported.)

Further, as reported last year, diseases that cause skin lesions, such as syphilis, have been implicated as facilitating transmission of human immunodeficiency virus (HIV) infection. In Maryland STD clinics, 20 % of syphilis patients are coinfected with HIV. As a result of the increases in P&S syphilis, young, heterosexual men and women who live in urban areas are likely to be at greater risk for infection with HIV.

TETANUS (1)

0.02/100,000 (U.S. - 0.02/100,000)

The one reported case of tetanus was a 29 year old woman, who developed trismus 10 days after injury to her leg. With treatment with tetanus immune globulin (TIG), she recovered fully within 3 weeks. The patient's history of primary tetanus vaccination was unknown, but she had had one dose of tetanus toxoid in 1986 after an injury.

TUBERCULOSIS (466)

10.17/100,000 (U.S. - 9.3/100,000)

In 1988, Maryland reported 466 cases of tuberculosis. This represents an increase of 8.9% over 1987 (Figure 13). Six counties (Caroline, Dorchester, Montgomery, Somerset, Prince George's, Somerset, and Wicomico) and Baltimore City reported case rates above the national rate.

In Baltimore City only 5.8% of the cases were foreign born, however, in the remainder of the state, 37.5% of cases were foreign born (with a high of 67% of Montgomery County's 85 cases foreign born).

A match of the TB and AIDS registries from 1978-1988 disclosed 43 persons with both diagnoses (1.16% of 3695 TB cases had AIDS, and 2.77 % of 1552 AIDS cases had TB).

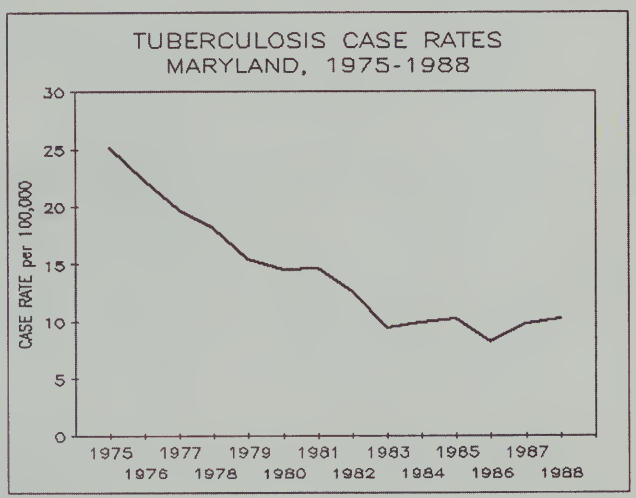

Figure 13

TYPHOID FEVER (6)

0.1/100,000 (U.S. - 0.2/100,000)

The six patients with typhoid fever were exposed in India (2), Pakistan (1), Bolivia (1), and El Salvador (1). The source of infection for one person was his Salvadorian wife who was a carrier of *S. typhi*.

Outbreaks of Diseases Reported in Maryland, 1988

Disease	Setting of Occurrence or Transmission							
	Day Care	Food Srvc.	Hosp	Insti-tution	Nurs. Home	School	Other	Total

Total	10	39	14	8	108	9	36	224

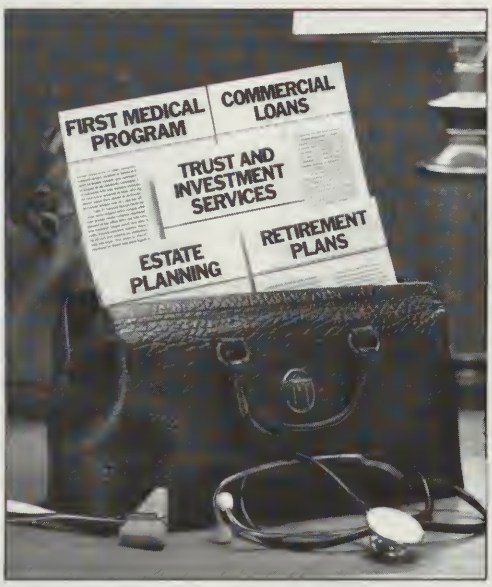
Table 2

OUTBREAKS OF DISEASES (224)

Outbreaks of diseases are reportable under Code of Maryland Regulations. During 1988, 224 outbreaks were reported to health departments in Maryland. Table 2 depicts the reported outbreaks by disease and setting.

Influenza outbreaks are commonly reported from nursing homes and institutions and occur during the period December through April. Outbreaks of non-bacterial gastroenteritis also sweep through the state's nursing homes during the same time of year. In a few outbreaks we obtained serum or stool specimens for viral identification, and have documented Norwalk or Norwalk-like agents as the etiology.

Foodborne gastroenteritis outbreaks caused by *Salmonella* most commonly occur during the warm summer months.



The 41 outbreaks listed in Table 2 as "Other" include outbreaks of, or outbreaks caused by, respiratory infections (4), conjunctivitis (2), *Bacillus cereus* (1), pertussis (1), botulism (2), *Clostridium perfringens* (1), *Campylobacter* (1), *E. coli* (1), giardiasis (2), Herpes simplex (1), *Legionella* (1), measles (3), mumps (2), mushroom intoxication (1), *Neisseria meningitidis* (1), parainfluenza (1), pediculosis (1), *Pseudomonas* (1), ringworm (1), scombroid intoxication (6), *Staph. aureus* (3), *Streptococcus* (2), *Vibrio parahemolyticus* (1), and multiple organisms (1).

New EIS Officer Comes to Maryland

Timothy Cote', MD, MPH, has been assigned by the Centers for Disease Control to be the Epidemic Intelligence Service (EIS) Officer for Maryland. Dr. Cote' received his undergraduate degree at Syracuse University in 1982. He attended Howard University College of Medicine (1982-87) and Harvard School of Public Health (1984-85), and received his MD and MPH degrees in 1987. After a Transitional Internship at Maryland General Hospital, he spent a year as a Preventive Medicine resident at the Illinois Department of Public Health in 1988-89.

We are pleased that he will be joining the staff of the Epidemiology and Disease Control Program for the next two years.

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

Highlights: Executive Committee and Council Actions

Council - April 12, 1989

Minutes - The Council minutes of Thursday, March 23, 1989, were approved as submitted.

Recognition - The Chair called on the President, Dr. Dobridge, who presented certificates of appreciation to the members of the Executive Committee. Dr. Dobridge also presented the Governor's Citation for Excellence to Dr. Emidio Bianco, Chairman of the Peer Review Committee, for his contribution in the development of the *Peer Review Handbook.*

Professional Ethics Committee - Council approved the following policy statements as presented by Dr. Louis Breschi, Chairman of the Professional Ethics Committee:

Revised Policy Statement on Discrimination

(a) In this section, "discrimination" means unfair prejudgment due to group identification or affiliation including, but not limited to, discrimination based on race, color, religion, creed, ethnic origin, a handicapping condition, sex, national origin, or sexual orientation.

(b) The Faculty endorses Principle 6 of the AMA's Principles of Medical Ethics. Principle 6 provides that "A physician shall, in the provision of appropriate patient care, except in emergencies be free to choose whom to serve, with whom to associate, and the environment in which to provide medical services."

(c) However, the Faculty deplores discrimination, particularly within medical societies, component societies, and medical staffs.

(d) The Faculty also strongly deplores the selection of patients solely upon the basis of the patient's ability to pay. Examples of this category of patients are Medicare and Medicaid patients.

Revised Policy on Return-to-Work Statements

(a) Return-to-work statements may contain the diagnosis determined by the physician. It is suggested that physicians not indicate such diagnoses unless permission has been given by the patient.

(b) Return-to-work statements prepared by a physician can be, on occasion, signed by the physician's secretary or nurse on behalf of the physician, provided that permission has been given by the physician to his employee to do so for a particular patient or occurrence.

(c) Frequently, physicians complete absence from work statements in advance of the date the patient should return to work. Such a statement should contain the date of issuance and a specified date by which full recovery is anticipated.

Introductions - The Chair introduced Dr. James T. Clowe, Speaker of the AMA House of Delegates and speaker for the Plenary Session of the Faculty's annual meeting, and Dr. Louis Breschi, who recently became a member of the Council.

State Boards and Commissions - The Council approved the following nominees for the board/commissions indicated:

Advisory Board on Hospital Licensing
Zorayda Lee-Llacer MD, *Clinton* (CCM)
(incumbent) June 30, 1989, 5-year term

Commission on Hereditary and Congenital Disorders
Stephen S. Amato MD, *Baltimore* (PD)
June 30, 1989, 4-year term

Commission on High Blood Pressure & Cardiovascular Risk
Hilary T. O'Herlihy MD, *Glen Burnie* (CD,IM)
(incumbent) June 30, 1989, 4-year term

The above nominees will be submitted to the Governor's office for consideration of appointment.

Medicare Program - The Chairman introduced Dr. Barry Gold, the new Medical Director of the Blue Cross/Blue Shield Medicare Program, who offered to be of assistance to physicians and to answer any questions they may have relative to the program.

Mutual Fire Inland and Marine Malpractice Insurance Company - The Council received an update on the insolvency of Mutual Fire. Physician subscribers to Mutual Fire who may have a malpractice claim filed must rely on the terms of Mutual Fire's reorganization plan for payment of any malpractice claim. Med Chi is constrained in regard to any action on behalf of its members insured by Mutual Fire because of Med Chi's affiliation with the Med Chi Insurance Agency and restraint-of-trade considerations; however, Council was advised that Med Chi will keep its members apprised of the status of Mutual Fire's reorganization plan. In addition, on request, a list of Maryland physicians covered by Mutual Fire will be available to similarly situated Med Chi members.

Emeritus Membership - The Council approved the following physician for Emeritus membership at the request of the component indicated:

Richard A. Sindler MD, Towson, *Baltimore City*

Pro Monitoring - Dr. R. Lane Wroth, Medical Director of the Delmarva Foundation for Medical Care, Inc., presented the Health Care Financing Administration's mandated requirement for preadmission/preprocedure review. Discussion ensued regarding the manner in which the medical community was informed of this requirement, and several councilors indicated their displeasure with the way in which notification took place. Ms. Jean Murphy, Vice President for Contracts, Delmarva Foundation, indicated that notification was sent to several specialty societies prior to April 1, however. Dr. Wroth agreed to continue the relationship with the Med Chi PRO

Monitoring Committee and, in the future, such notification will be coordinated in a timely fashion.

Council - April 14, 1989

Introduction of New Members - The President, Dr. Raymond M. Atkins, called the names of the following new members of Council:

Dr. Alex Azar, *Wicomico County*
3rd Vice-President
Dr. Louis C. Breschi, *Baltimore County*
Dr. Bahram Erfan, *Prince George's County*
2nd Vice-President
Dr. A. H. Ghiladi, *Baltimore County*
Dr. Allan T. Leffler, II, *Howard County*
Dr. Hiroshi Nakazawa, *Baltimore City*
Daniel P. Paoli, *Student Component Society*

Those present were welcomed with applause by the Council.

Election of Chairman and Vice-Chairman - The President called for nominations from the floor for the position of Chairman. The name of Dr. J. David Nagel was placed in nomination, the nominations were declared closed, and Dr. Nagel was elected unanimously to the position of Chairman of Council.

Dr. Nagel presided as Chairman of Council and called for nominations from the floor for the position of Vice-Chairman. Dr. Hiroshi Nakazawa was nominated, the nominations were declared closed, and Dr. Hiroshi Nakazawa was elected unanimously to the position of Vice-Chairman of the Council.

Legislative Report - Gerry Evans presented an update on the activities of the 1989 Legislative Session.

Executive Committee - May 18, 1989

Executive Committee members welcomed Dr. Hiroshi Nakazawa, the newly elected Vice-Chairman of the Executive Committee and Council.

Chairman J. David Nagel MD announced there would be a memorial service for Dr. J. D. Drinkard, Past-President of Med Chi, on May 21, at 4:00 p.m. at the Grace United Church.

Minutes Approved - The Executive Committee minutes of March 16, 1989, were approved as submitted.

Medicaid - Provider Agreement - The Executive Committee approved a draft letter to Dr. Joseph E. Davis, Director of the Medical Care Operations Administration, DHMH, urging adoption of recommended changes in the Provider Agreement for Participation in the Title XIX Program. In particular, Med Chi requested that DHMH give consideration to reducing the period of time for retention of physicians' appointment records, and that a statement be included in the agreement that the Department provide advance notification of potential changes in program procedures and/or policies prior to the effective implementation date to allow adequate time for physicians to respond.

AMA Delegate/Alternate Delegate - The Executive Committee received for information a letter from Med Chi's Parliamentarian, Alan M. Rifkin, Esq., concerning the parliamentary rule on filling vacancies among the AMA Delegation. Mr. Rifkin concurred with the Faculty Bylaws, Article IV, Section 9, that a "vacancy in any other office elected by the House of Delegates shall be filled by the Council until the next annual session of the House of Delegates." Mr. Rifkin also recommended that the Bylaws Committee consider amending Section 6 of Article XI of the Faculty Bylaws by deleting the word "their" to avoid any misinterpretation relative to the seating of the delegates and alternates. This issue will be forwarded to the Bylaws Committee for its consideration.

AMA Issues

Focused CME Programs for Enhanced Clinical Competence - The Executive Committee received, as information, Med Chi's response to the AMA's request regarding activities relating to the needs of physicians who have been identified as requiring focused continuing medical education.

AMA Commemorative Stone - The Executive Committee approved an expenditure of $300 as a contribution to the AMA's campaign to refurbish the AMA Commemorative Stone housed in the Washington Monument.

Hospital Medical Staffs Committee - Dr. Victor Hrehorovich, Chairman of the Hospital Medical Staffs Committee, presented an update on the status of the model hospital medical staff bylaws and requested authorization of the Executive Committee to write to the hospital medical staffs announcing the availability of Med Chi's resources in providing consultative expertise in the area of quality assurance. Following discussion, the Executive Committee recommended that additional information be included in the communication to the hospital medical staffs to reflect the costs incurred for such services. The Executive Committee also approved a draft letter addressed to the chiefs of hospital medical staffs transmitting AMA data on the legal status of hospital medical staffs.

Medicaid Diversion Fund - Dr. Atkins reported on recent discussions with Secretary Wilzack on this issue. Med Chi has expressed its opposition to the Medicaid Hospital Diversion Program and provided recommendations, as approved by Council, in a letter to the AELR (Administrative, Executive and Legislative Review Committee) of May 1, 1989.

Brand Name Drugs Prescriptions - Medical Assistance - Dr. Atkins advised the Committee that during discussions with Secretary Wilzack he requested that the Department keep Med Chi informed of which drugs they are concerned about and requested that they work with Med Chi in resolving this problem. Dr. Atkins letter of May 5, 1989 to Secretary Wilzack citing Med Chi's opposition to Medicaid Transmittal #91

(Prescriptions for Brand Name Drugs) was provided to the committee for review.

Financial Reports - The financial reports for March and April 1989 were reviewed and accepted by the Executive Committee. Following discussion, the Executive Committee adopted a motion by Dr. Atkins that the Faculty's Finance Committee review the monthly financial reports prior to submission to the Executive Committee.

Committee on Scientific Activity - It was reported that the Turf Valley Hotel and Country Club, which had been proposed as the 1990 site for the Faculty's annual meeting, will charge a fee of $5,000 per day for use of meeting space. This matter will be discussed at the meeting of the Committee on Scientific Activity on Monday, May 22, and a report of the committee's deliberations will be provided to the Executive Committee at its next meeting.

Physician Quality Assurance Board - The Executive Committee approved for mailing a letter to the Board of Physician Quality Assurance requesting a meeting with the Board to review the complete case management processing system due to a recent marked increase in the number of cases forwarded to Med Chi and to discuss the matter of the Board issuing subpoenas for medical records.

Pro Monitoring Committee - The Executive Committee approved the request of Dr. John A. Singer, Chairman of the PRO Monitoring Committee, to organize an accredited statewide seminar to educate physicians regarding the Delmarva Foundation's PRO contractual requirments, its organization, and its administration, etc. Dr. Atkins stated he had received an invitation from Dr. R. Lane Wroth, Medical Director of the Delmarva Foundation for a luncheon meeting and will extend the invitation to Dr. Singer as well.

Howard County Medical Society - Mr. Troisi reported on a potential discrimination suit against the Howard County Medical Society involving an HIV-positive individual who had called the society for the referral of a physician for treatment and, allegedly, was told they had no listing of physicians available for treating HIV patients. The case has been reviewed by the Howard County and Maryland State authorities, and the society was not cited as being discriminatory in its action. The federal government also had the case for review, but on learning the Howard County Medical Society was not federally funded, withdrew from the case. The matter is presently in the hands of Alan Rifkin, Esq., for review.

Health Convocation - The Executive Committee approved sponsorship of the 1989 Health Convocation with a contribution of $2,500 to Larry Young Associates.

Committee on Aids - The Executive Committee approved a request of the Committee on AIDS for a contribution of $250 to the statewide "Stop AIDS" program to be administered by the Department of Family Medicine of the University of Maryland.

Legislative Committee Report - Mr. Evans gave a brief report on the activities of the committee and stated that a summary of the 1989 legislative session is near completion.

President's Comments - Dr. Atkins reported he plans to appoint physicians to the Legislative Committee who will be assigned the task of developing position papers on various subjects, for example, AIDS, mental health, peer review, drugs, breast cancer, tort reform, laboratory regulations, etc. This information will be disseminated to members of the Faculty through the component societies to keep them apprized of the Faculty's position on these various issues.

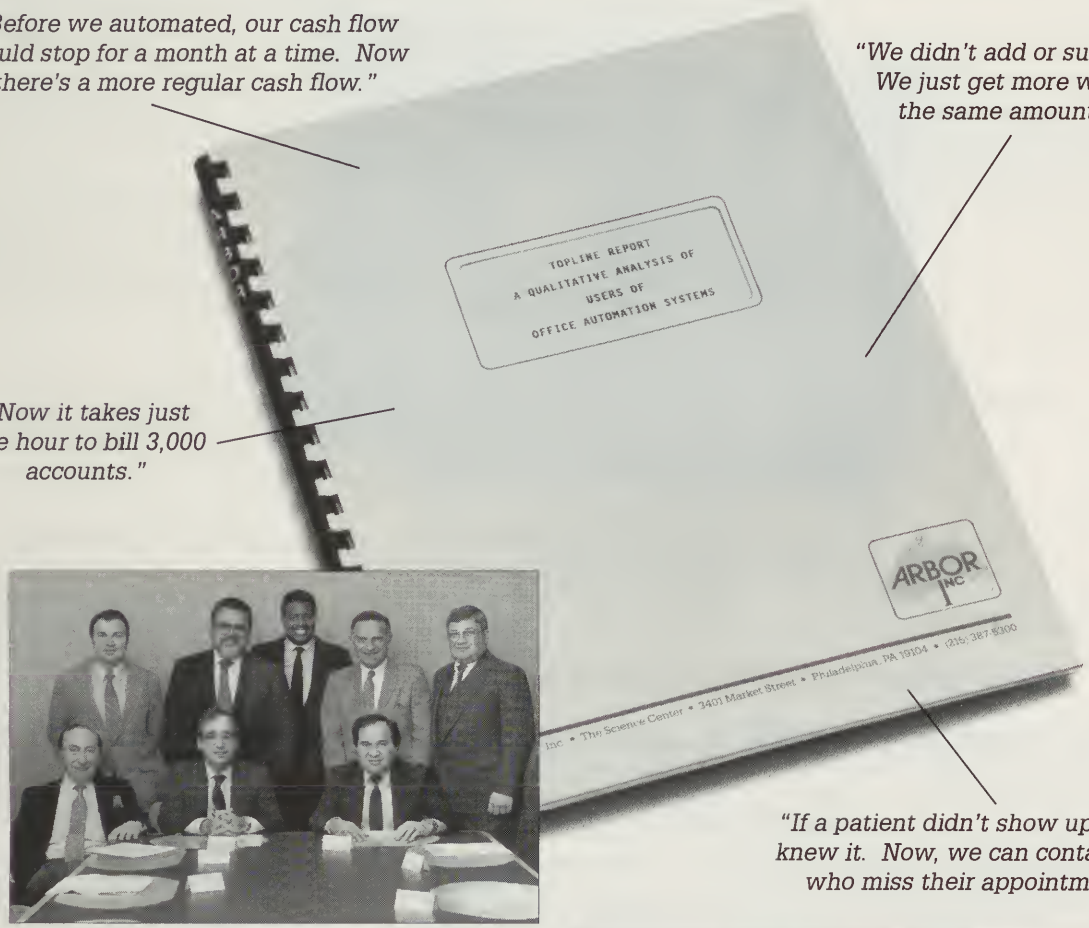
Dr. Atkins also stated that as a result of discussions in a recent meeting with the Faculty's committee chairmen, it was decided that all committees would meet on a monthly basis and copies of the minutes of the meetings would be forwarded to the Executive Committee for review. Following discussion of the best way in which the Executive Committee should review this information, Dr. Nagel suggested that he would review the material with the Executive Director to extract the pertinent information to be forwarded to the members of the Executive Committee. ■

Fourth Annual Institute Financial Representation of Physicians and Other Ambulatory Care Providers

Sponsored by:
The Maryland Association of
Certified Public Accountants

The conference addresses financial and business issues related to the operation of medical practices including practice valuation, purchases and sales, various practice management issues, tax, Medicare reimbursement and fraud and abuse.

The 1 1/2 day conference will be held at the Baltimore Hilton Inn on September 28 - 29, 1989.
Tuition is $205.



For more information, contact the Maryland Association of CPA's at
301-296-6250.

Eight physicians and four medical office managers tell "all" about automation.

"Before we automated, our cash flow would stop for a month at a time. Now there's a more regular cash flow."

"We didn't add or subtract people. We just get more work done in the same amount of time."

"Now it takes just one hour to bill 3,000 accounts."

"If a patient didn't show up, I never knew it. Now, we can contact those who miss their appointments."

What can automation do for you?... What can't it do?... Is it practical?... What should you look for in a system?... What should you expect from the company who sells you the system?... How will it affect your staff?... And how do you go about getting the answers to all these questions?

KTI can help. As the systems supplier to over 3,000 healthcare professionals, we brought together a group of physicians and medical office managers to talk about the benefits and cautions of automation. And prepared a special report on their thoughts and comments.

If you want the advantage of their experiences, send us this coupon. And you'll get a lot of answers in just a few minutes of reading.

September 1989

Semiannual Meeting

Med Chi's Semiannual meeting will be held at the Sheraton Ocean City Resort and Conference Center on September 14-16, 1989. A tentative schedule for the meeting is as follows:

Thursday, September 14, 1989

8 a.m.-5 p.m. Registration
8 a.m. Exhibits Open
8 a.m.-12 noon White Paper Presentations
These special scientific sessions detail the content of Med Chi's new "White Papers" or issue position papers. Topics are issues requiring Med Chi's position and may become legislative issues in the 1990 session of the Maryland General Assembly.
3 p.m.-5 p.m. Med Chi Council Meeting

Friday, September 15, 1989

8:00 a.m.- 5 p.m. Registration
8:30 a.m. Exhibits Open
9 a.m. Auxiliary Meeting and Breakfast Buffet
9:30 a.m.- 12 noon Med Chi House of Delegates Meeting
2 p.m.- 5:30 p.m. Scientific Sessions

Saturday, September 16, 1989

8 a.m.-5 p.m. Registration
9 a.m.-12 noon Exhibits Open
9 a.m.-12:30 p.m. Scientific Sessions
12:30 p.m. MMPAC Luncheon
Maryland Senate President Thomas V. "Mike" Miller is the featured speaker.

Expenditure Targets

Congress is scheduled to vote on the issue of adopting expenditure targets (ETs) as soon as the session begins in September. ETs are government-set expenditure goals for physicians that are intended to control the volume of physicians services under Medicare Part B. If the targets are exceeded, Medicare physician reimbursement rates will be adjusted downward and across the board. The AMA maintains that government control of the volume of medical services means limits or restrictions on those services.

Med Chi has taken several steps to inform its member physicians and the public about ETs. In July, Med Chi sent letters describing the detrimental aspects of ETs to Maryland's U.S. senators and congressmen and to the editors of the *Baltimore Sun* and the *Washington Post*. In addition, Med Chi staff and Public Relations Committee Chairman, William A. Cassidy MD met with AMA President Alan R. Nelson MD to discuss strategies for defeating ETs. Dr. Nelson highly commended Med Chi's efforts in informing its members about this proposal. In addition, the auxiliary and several component societies have notified their membership through phone trees.

To defeat ETs Maryland physicians must encourage their patients to contact their congressmen before Congress convenes in September, and ask them to delete ETs from the Medicare budget reconciliation bill.

Thus far, Representative Constance A. Morella (D-8th District) from Montgomery County, and Representative Tom McMillen from Prince George's County have agreed to delete ETs from the budget.

Med Chi has developed additional ET flyers (see the following pages) so that Maryland physicians may inform their patients about expenditure targets. These flyers describe ETs and provide the phone numbers of all Maryland congressmen. Physicians are encouraged to make copies for their patients and to post the flyer in their offices. For additional copies contact Betsy Newman, Public Relations for Med Chi at 301-539-0872, or in Maryland, 1-800-492-1056.

Problems With Third-Party Carriers?

The Committee on Managed Care and Third-Party Liaison is collecting information from Med Chi members regarding problems they have encountered with third-party carriers. The Committee is particularly interested in arbitrary or unreasonable practices and procedures of third-party carriers. Please forward your concerns to: Aristides Alevizatos MD, Chairman, Committee on Managed Care & Third Party Liaison, Medical & Chirurgical Faculty of Maryland, 1211 Cathedral Street, Baltimore, MD 21201.

UPIN Unique Physician Identification Number

Under the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA), a Registry of Medicare Physician Identification and Eligibility Records was established. The intent of this COBRA legislation is to assure proper payment of Medicare reimbursements and to track practitioners sanctioned by Medicare. Medicare carriers are compiling practitioner data for this Registry. All physicians, including physicians participating and nonparticipating in Medicare, are being contacted by their Medicare carriers for certain identifying information including provider name, provider number, phone number, billing address, and actual physical location of doctor's office. The information will be used to assign a unique identification number (UPIN) to all physicians who receive payment from Medicare. The provisions of COBRA require that all physicians be assigned a UPIN by mid-November, 1989. The information compiled and provided to the Registry is protected from public access by the Privacy Act.

Because of the AMA's interest in helping the Health Care Financing Authority (HCFA) assure proper Medicare reimbursement to physicians, its concern about tracking sanctioned physicians, and its desire to minimize additional requests for information from physicians, AMA has agreed to assist the Registry in identifying duplicate physician records in the carrier data.

Clarification

Comments regarding the "Generic Subsitution Ruling" in the August issue of this newsletter applies to all prescriptions for Medical Assistance Beneficiaries.

Angelo J. Troisi, FACHE
Executive Director

Is Congress Listening?

What Americans said...	What Congress did...
1986 Americans opposed any reduction in Medicare spending*	**1986** *Cut* Medicare spending
1987 Americans favored increased spending for Medicare*	**1987** *Cut* Medicare spending
1988 Americans needed increased government funding on health care for the elderly*	**1988** *Cut* Medicare spending

This year the government wants to cut Medicare again by limiting the amount of medical services for seniors through **"Expenditure Targets."**

Expenditure targets are government-set limits on spending for needed health care. These targets are the first step toward rationed health care for the elderly.

Physicians want you to get all the care you need. To protect your care, call your Congressman today. Their names are listed on the back of this flyer. Tell them you are concerned about the cuts in the Medicare program. Urge them to delete **expenditure targets** from the Medicare Budget Reconcilliation Package.

This Time, Make Congress Listen

*Public opinion survey results published in *American Medical News* June 23\30, 1989

Medical and Chirurgical Faculty of Maryland

Ask your doctor if you have any questions. Or if you need more information, please contact Med Chi's Public Relations department at 301-539-0872 or in MD 1-800-492-1056.

Help Protect Our Medical System

Call your Senators and Congressmen today and say:

This could be you...

In Canada, where **expenditure targets** exist, people wait months for many medical procedures. In Vancouver, Canada there are 1-3 month waiting periods for psychiatric, neurologic or routine orthopedic consultations.
Is that what *you* want?

In America, Congress wants to limit the amount of services for seniors by creating **Expenditure Targets. Expenditure Targets** are government-set limits on spending for needed health care.

These targets are the first step toward a rationed health care for the elderly which could result in waiting periods for medical treatments like those in Canada.

Physicians want you to get all the care you need.

To protect your care, call your Congressman today. Their names are listed on the back of this flyer. Tell them you are concerned about the cuts in the Medicare program. Urge them to delete expenditure targets from the Medicare Budget Reconcilliation Package.

Ask your doctor if you have any questions. Or if you need more information, please contact Med Chi's Public Relations department at 301-539-0872 or in MD 1-800-492-1056.

THE FIRST NAME IN MEDICAL OFFICE AUTOMATION IS STILL THE LAST WORD IN SERVICE.

Since 1977, CBSI has been the leader in medical office automation systems. ❑ Talk to your colleagues and peers in more than 5,000 offices and 50 medical specialties around the area relying on the Physician Information System. Ask what they think about our system, our unequalled level of support and our commitment to the health of your practice. Ask about our system's adaptability, cost-effectiveness and personalized approach. ❑ Then call 770-2292 (In Maryland call toll-free at 1-800-638-6364) and put the CBSI Physician Information System to work for you.

"Based on my experience with other systems, every company looks good prior to the sale. It's not until after the money changes hands that the truth comes out. Please pass along my thanks to each of your staff for making this the smoothest conversion I've ever experienced."

Robert T. Simms
Orthopaedic and Sports Physical Therapy Center
Annapolis, Maryland

"Our collections have improved significantly since installing Physician Information System. Furthermore, CBSI provides a timely response to our questions and calls for service."

Harold Tucker, M.D.
Razzack, Tucker and Hutcheon, M.D., P.A.
Towson, Maryland

"CBSI's technical expertise, including timely revision of software to meet the ever-changing requirements of Blue Shield and Medicare, has been outstanding."

Robert E. Zadek, M.D.
Drs. Abrams, Zadek and Mack, P.A.
Baltimore, Maryland

Women and Organized Medicine: A Call for Action

Just as women physicians have assumed the responsibilities of their role in care of patients, they must also contribute to shaping the role of the physician and the future of medicine at a time when health care is undergoing major changes.

Although the number of female physicians in the United States continues to increase, their level of representation and involvement in organized medicine generally remains unchanged. Between 1970 and 1985 the number of practicing physicians in this country grew by 66 percent; the number of women physicians increased three times that amount to over 80,000, according to the AMA.* In 1980, women constituted 12 percent of the physician work force and by the end of 1985, the number of women had increased to 15 percent of the total physician population. The U.S. Bureau of Health Professionals predicts that by the year 2000 approximately one fifth of the nation's physicians will be women. Despite this extraordinary rate of increase, only about 28 percent of female physicians are involved in organized medicine as compared to approximately 45 percent of male physicians.

AMA data show the national problem of recruitment of women in organized medicine is especially pronounced at the state level. Most states affirm difficulties in recruiting women members and acknowledge that women are underrepresented in their societies. Because of this, several state medical societies have begun recruitment programs specifically geared toward women physicians.

The most popular method of recruitment at the state level is through direct mailings. However, recent efforts show this is not effective. In 1988, the California Medical Association sent personalized letters to 1,910 nonmember women physicians in 11 counties. Only 5 percent of the women answered the letters. The San Francisco Medical Society conducted a similar effort in 1988; they sent a series of three mailings to all nonmember women physicians in the area. Two of the three mailings included membership applications. Despite this extensive effort, only one application was received.

In 1987, the Indiana State Medical Association (ISMA) took a different approach to membership mailings and sent a survey to all women physicians in the state. The survey was intended to pinpoint the interests and concerns of women physicians. John Wilson, Controller of ISMA, said the only conclusive result from the survey was that women physicians prefer informal, unstructured meetings to exchange information. Wilson expressed concern about the low percentage of women currently in membership

*Statistical information provided courtesy of the AMA Women in Medicine Project.

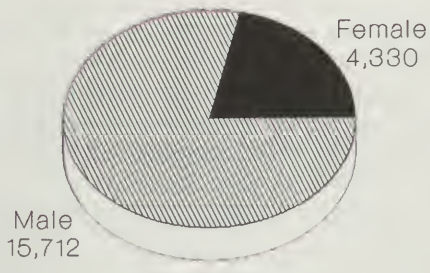
and said, "All medical societies should be doing something to encourage more women to join."

Like other states, Maryland, through Med Chi and several of its component societies, has initiated special recruitment efforts specifically targeted for women. One of these, the Montgomery County Medical Society (MCMS), is Med Chi's most active component in recruiting women. In November 1988, MCMS devoted an issue of *Montgomery Medicine* to women physicians covering topics from medical school interviews to referrals. In January, MCMS sent over 180 letters to nonmember women physicians and received nine requests for membership packets.

At the state level, Med Chi recently formed the ad hoc Women in Medicine Committee, which has started a statewide recruitment campaign for women physicians. In August, the Committee sent a recruitment letter encouraging nonmember women physicians to contact their component society. In September, the committee plans to invite several nonmember women physicians to attend the monthly meeting of the Women in Medicine Committee.

In addition to these conventional methods of recruitment, the Women in Medicine Committee is taking further steps to analyze problems unique to women physicians that currently may prevent women from becoming involved.

Juggling familial responsibilities is often difficult for women. The Women in Medicine Committee is exploring the possibility of providing minimal cost child care services for members conducting business at Med Chi. Med Chi offered this service during the 1988 Semiannual Meeting and this year's Annual Meeting.



There have been few women physicians in the ranks of organized medicine to provide strong role models. To encourage leadership and high visibility within the organization, Chairman Margaret Snow MD has requested the appointment of women to all Med Chi committees. The Women in Medicine Committee hopes that once women are established within the committee framework and accepted as leaders in the organization more women will join.

Future plans for the Committee include encouraging monthly forums at state and county levels for all women physicians so they may have the opportunity to discuss their situations and clarify problems.

Recruitment of women is challenging, but there is some indication that efforts are paying off. By December 1989, four Med Chi component society Presidents will be women (see interviews on next page). According to the AMA, 21,634 women were enrolled in medical school in 1985-1986. Thirty-six percent of these women are AMA student members compared to 40 percent of the male medical students. These figures are encouraging because they show a better balanced male/female ratio and they provide a strong base for the future of women in organized medicine.

National, state, and county medical societies are making a concerted effort to encourage women to join organized medicine. These groups recognize that women must become involved in order to have an organization truly representative of the general physician population that will promote and protect the interests of all physicians.

Comparison of Male to Female Physicians in Maryland

The Benefits of Organized Medicine

Many women physicians who have not joined organized medicine may not realize the benefits of belonging. Med Chi has a long history of representing and serving all Maryland physicians and is recognized nationwide as one of the most progressive medical associations in the United States. Highlighted below are just a few of the programs and services available to member physicians.

Insurance Programs

The Med Chi Agency offers insurance programs and financial services to Med Chi physicians and their office staff. Group insurance plans including health, life, dental, disability, and office overhead help to ease financial worries. In addition, malpractice, property/casualty, and personal lines insurance programs are available. Members also can use the personal financial planning services offered by the Med Chi Agency's professional staff.

Legal Services

Med Chi has an in-house attorney to provide legal advice on professional and medically related issues. Legal services include advice on the release of medical records, on termination of a physician/patient relationship, and on ethical situations. Analysis of contracts and hospital bylaws also is offered, and a confidential physicians defense panel is available to any member facing malpractice action.

Med Chi Library

One of the finest, most comprehensive medical libraries in the country, Med Chi's library has over 120,000 volumes, more than 600 periodicals, and an on-line computer research service. Med Chi library services are available to all members by telephone or mail.

Continuing Medical Education

Since physicians must keep up with the latest medical developments and the latest office management techniques, Med Chi offers scientific sessions during its Annual and Semiannual Meetings that fulfill Category I Continuing Medical Education credits. In addition, Med Chi offers a wide variety of practice management workshops throughout the year for physicians and their office staff.

Peer Review

Med Chi serves as the investigative arm of the Board of Physician Quality Assurance, performing medical practice evaluations and investigations directed toward resolving patient complaints. For physicians whose medical competence suffers due to chemical dependency or psychiatric impairment, Med Chi offers a nationally recognized, confidential physician rehabilitation program.

Legislative Representation

Since its incorporation in 1799, Med Chi has continued its founding philosophy of leading the way in political action and taking steps to secure just laws governing the practice of medicine. Med Chi is the primary voice of physicians and their patients in Annapolis. Med Chi works to influence legislative issues at both state and federal levels and, through its Legislative Committee, sets the direction for legislative action. Med Chi employs a full-time lobbyist who communicates Med Chi positions on health-related legislation. Through MMPAC, the Maryland Medical Political Action Committee, members can show their support for selected political candidates.

Med Chi offers much more than what is described above. It allows physicians to have an impact on concerns relevant to their practice and their patients and provides an opportunity to expand professional and personal relationships. Member physicians get the support necessary to begin a successful practice, and they become part of an organization whose members are the true voice of medicine in Maryland.

To receive a brochure that describes more Med Chi benefits call Med Chi's Membership Office at 539-0872 or 1-800-539-0872. Med Chi physicians receive a $35 credit toward their next year's dues for each physician they recruit.

I have been a member of Med Chi for many years and the organization has always been supportive of what I was doing. I have been able to grow as a leader while working within Med Chi. I first became an alternate delegate, then a delegate, then I was a co-chairman, and now I am a committee chairman. Med Chi is always open to growth.

It is gratifying to be able to say that you are working in organized medicine. I can only speak very highly of this organization of physicians who are all working together for a common cause.

Susan Guarneri MD
President-Elect
Baltimore City Medical Society

I am impressed by the fact that many physicians say, "Organized medicine doesn't represent me or my interests." The people who are most adamant about not joining are very ignorant about what organized medicine does. Physicians not involved in organized medicine usually are unclear about who is representing them. They assume that some "Joe" will do it, but what they don't realize is that "Joe" gets tired.

Congress often acts in a vacuum from the lack of physicians' input. We need more people to get involved in the important issues. Physicians can do this by joining together and sending a unified message to Congress. This can be done by simply writing letters or calling one's congressman.

One problem is trying to get physicians behind a single front. We have too many chiefs and no indians. Physicians must unify behind a group of leaders and vigorously support them. Med Chi provides that unity and that leadership.

Cheryl E. Winchell MD
President-Elect
Montgomery County Medicial Society

The number of women in medicine has increased significantly in the last few years. Just as women have assumed the responsibilities of their role in care of patients, they must also contribute to shaping the role of the physician and the future of medicine at a time when health care is undergoing major changes.

Magaret Sherrard MD
Delegate, Baltimore County

Hospitalized Head-Injured Patients in Maryland: Incidence and Severity of Injuries

Ellen J. MacKenzie PhD, Sharon L. Edelstein ScM, and James P. Flynn MD, MPH

Authors MacKenzie and Edelstein are with the Injury Prevention Center and the Health Services Research and Development Center, Department of Health Policy and Management, The Johns Hopkins School of Hygiene and Public Health. Dr. Flynn is Director/Chief Executive Officer, Montebello Rehabilitation Hospital and Acting Director, MIEMSS, University of Maryland Medical System, Baltimore.

This work was supported in part by Centers for Disease Control Grant No. R49/CCR302486-01 from the Division of Injury Epidemiology and Control, Center for Environmental Health and Injury Control, Centers for Disease Control, and by the National Center for Health Services Research Grant No. R01 HS05630.

Reprints: Ellen J. MacKenzie, Health Services Research and Development Center, 624 N. Broadway, Baltimore, MD 21205 (301) 955-6498.

Hospital discharge data collected from all acute care hospitals in Maryland were used to examine severity-specific rates of hospitalized head injuries in 1986. Findings indicate that males are at twice the risk of females for hospitalization for head injury; whites and nonwhites are at similar risk. Evidence that the rate of hospitalization for head injury may be increasing underscores the importance of head injury as a major public health problem in Maryland.

The public health importance of head injury as a major source of mortality and morbidity is well recognized. Studies published within the last 10 years have reported incidence rates that range from 152 to 200 per 100,000 population depending on case definitions and case ascertainment methodologies.[1-11] Despite differences in the magnitude of these estimates, findings regarding the patterns of incidence by age, race, sex, and external cause are highly consistent. Few published studies, however, have systematically examined these patterns of incidence by severity. Uniformly collected statewide hospital discharge abstract data generally have provided an excellent source of information on the incidence of injury severe enough to require hospitalization.[12,13] The recent development of a computerized conversion table that translates ICD-9CM coded discharge diagnoses into injury severity scores has led to new applications of these databases providing population-based data specific to severity.[14] These data are useful in projecting the number of individuals who survive a serious head injury and who are likely to need rehabilitation services.

Materials and Methods

Data Sources Incidence of hospitalized head injuries for 1986 were computed for the State of Maryland using uniform hospital discharge abstract data maintained by the state's Health Services Cost Review Commission (HSCRC). All 56 acute care, nonfederal hospitals in Maryland are mandated by law to submit uniform data on all discharges to the Commission, which is

responsible for setting hospital rates under the state's per case payment system. Excluded from the database are injuries treated on an outpatient basis as well as deaths that occur at the scene, in transport, or in the emergency department. Data abstracted for each hospital discharge include patient demographics (age, race, sex, county of residence), up to five discharge diagnoses coded using the Clinical Modification of the 9th Revision of the International Classification of Diseases (ICD-9CM), up to three procedures (ICD-9CM coded), total and ICU length of stay, total and component charges, discharge status, and expected principal source of payment. There is a high degree of confidence in the quality of the discharge abstract data including the diagnostic information: it is used in paying all hospitals in Maryland.

To compute discharge rates, the total number of hospital discharges (both residents and nonresidents) was divided by the state resident population for that year as estimated by the Maryland Department of Health and Mental Hygiene. This approach assumes that the number of state residents treated in out-of-state hospitals roughly equals the number of nonresidents treated in-state.

Definitions A head-injury discharge was defined as any discharge with a principal or secondary diagnosis of a skull fracture and/or intracranial injury (ICD-9CM codes 800, 801, 803, 804, 850-854). Only those secondary head-injury discharges with a principal diagnosis of a traumatic injury to another body system, however, were included. Thus individuals who sustained a head injury secondary to a fall following a stroke would not be included if the stroke was listed as the principal diagnosis.

Injury severity was determined through the use of the computerized conversion table ICDMAP, which maps ICD-9CM coded discharge diagnoses into Abbreviated Injury Scale (AIS) scores.[14] The resulting severity scores are referred to as ICD/AIS scores. The AIS is the most widely used injury severity scoring system that is based primarily on anatomic descriptors of the injury.[15] It is an ordinal scale that ranges from 1 (minor injury) to 6 (maximum injury, virtually unsurvivable). While not a perfect tool for providing precise information on injury severity, ICDMAP does afford the opportunity to classify trauma cases according to relative severity when only ICD-9CM coded discharge diagnoses are available.

Assumptions used in assigning AIS scores to ICD-9CM diagnoses were generally conservative. Further, errors in chart abstracting and ICD coding have been shown to lead to lower than average AIS scores.[14] Therefore, the severity of trauma cases will, on average, be slightly lower when using the conversion process than when scoring directly from the medical record. Discharges with more than one head injury diagnosis were classified according to the most severe (highest ICD/AIS score) head injury. For purpose of description, ICD/AIS 1-2 injuries are referred to as "minor," ICD/AIS 3 injuries as "moderate," ICD/AIS 4 injuries as "serious," and AIS 5 injuries as "severe."

Head injuries also were classified according to their external cause as coded using ICD-9CM E-codes. Causes were grouped for presentation into motor vehicle-nonpedestrian (E810.0-823.9 excluding those with a fourth digit of .7), motor vehicle-pedestrian (E810-E823 with a fourth digit of .7), bicycle (E826), falls (E880-888), assault (E960-978), and other. Only 56 percent of the head injury discharges in 1986 were E-coded. Further, the coding of external cause was strongly associated with both the severity of the injury (60 percent of ICD/AIS 1-2 head injuries were E-coded compared to 44 percent of ICD/AIS 4-5 head injuries) and with age of the patient (75 percent of those ages 0-4 were E-coded compared to 41 percent of those aged 75 and above). For this reason the number of discharges by external cause was estimated by multiplying the percent distribution of cause based on those discharges with E-codes by the total number of head-injury discharges within age and severity specific subgroups and then adding across subgroups.

Findings

In 1986 there were 5,838 discharges (18 percent of all trauma discharges) with a principal or secondary diagnosis of a head injury. Of these discharges, 1,179 (20 percent) had only a secondary diagnosis of a head injury. The majority (70 percent) of patients' head injuries were minor (ICD/AIS=1,2). An additional 17 percent were moderately severe (ICD/AIS=3), 9 percent were serious (ICD/AIS=4), and 4 percent were severe (ICD/AIS=5). A total of 20 head injuries could not be severity rated due to a lack of specificity in ICD coded diagnoses. One-third of the head injuries were diagnosed as concussions (ICD 850), and an additional 37 percent were assigned ICD diagnoses of an intracranial injury of other and unspecified nature (ICD 854). Of the remaining 30 percent, 10 percent sustained skull fractures without significant intracranial injury, while 8 percent sustained cerebral lacerations and/or contusions, and 12 percent sustained an intracranial hemorrhage.

Discharge Rates by Age, Sex, Race, and Severity The 1986 head injury discharge rate for all ages was 132 per 100,000 population. Rates for minor, moderate, serious, and severe head injury were 92, 23, 12, and 5 per 100,000 respectively. The pattern of overall incidence by age was similar to that found by previous investigators (Figure 1 and Table 1). There were three incidence peaks: the first for young children ages 0 to 4 years (140 per 100,000), the second for adolescents and young adults ages 15 to 24 (237 per 100,000), and the third for adults ages 75 and over (188 per 100,000). However, patterns of incidence by age were different for minor, moderate, and serious/severe injuries. Young adults aged 15 to 24 were at a higher risk than any other age group for both minor (167 per 100,000) and moderate (42 per 100,000) head injury. Risk of

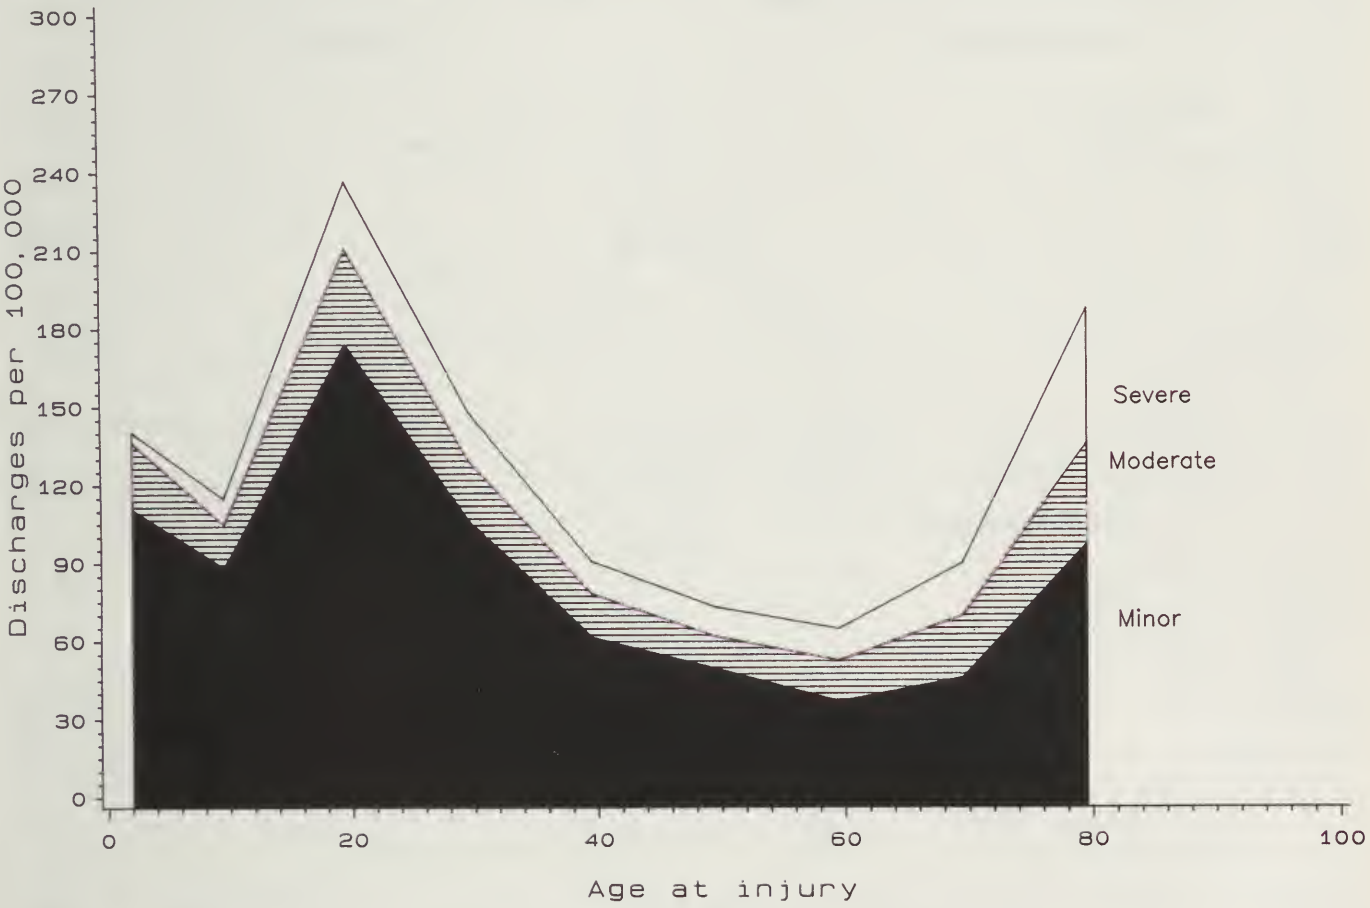

Figure 1. Head Injury Discharge Rates (per 100,000) by Age and Injury Severity (Maryland, 1986)

serious/severe injury, on the other hand, was highest among the elderly aged 75 and over (51 per 100,000). Incidence of serious/severe injury among young adults aged 15 to 24 was half (26 per 100,000) that for the elderly, and the risk of serious/severe head injury to young children was very low (4 per 100,000).

Incidence rates by age for specific ICD-9CM discharge diagnoses are summarized in Table 1. For classification cases were grouped according to the first listed head-injury diagnosis. Of particular interest is the high rate of intracranial hemorrhage among the elderly, aged 75 and over. Although the rate of discharges with a first-listed diagnosis of hemorrhage over all ages was 16.2 per 100,000, the rate of hemorrhage among the elderly was 63.1 per 100,000, more than twice the rate for any other individual age group and 3.5 times the rate for individuals less than 65 years of age.

Discharge rates by age and sex are summarized in Figure 2. The overall rate for males (176 per 100,000) was 2.1 times the female rate (87 per 100,000). The sex ratio is considerably lower among the elderly, ages 75 and over (1.3) and the young children ages 0 to 4 years (1.5), as compared with younger adults, ages 15 to 24 (2.5). However, this relationship of sex ratio by age varies with severity of the injury. Males and females aged 75 and over were equally likely to sustain minor injuries, while the risks to males of moderate and serious/severe injuries were 1.5 and 1.8 times the female rates. Overall, the sex ratios for minor, moderate, and serious/severe injuries were 1.9, 3.2, and 2.7 respectively.

Table 1. Discharge Rates (per 100,000) by First-Listed Head-Injury Diagnosis and Age (Maryland, 1986)

First Listed Diagnosis	Age at Injury									All Ages
	0-4	5-14	15-24	25-34	35-44	45-54	55-64	65-74	75+	
Skull fracture	42.1	10.2	17.8	11.8	6.8	7.0	5.5	8.0	12.3	12.7
Concussion	22.8	40.9	92.7	50.9	32.4	24.7	17.5	25.8	43.8	44.0
Cerebral laceration and/or contusion	7.0	8.2	20.0	9.8	8.4	4.4	5.5	8.4	14.4	10.0
Subarachnoid, subdural and/or extradural hemorrhage or other unspecified intracranial hemorrhage	9.2	8.4	17.9	16.7	13.0	9.8	13.5	25.1	63.1	16.2
Intracranial injury of other and unspecified nature	59.2	47.6	88.6	59.0	30.4	26.7	22.1	2.0	54.5	48.8
All diagnoses	140.3	115.3	237.0	148.2	91.0	72.6	64.1	89.3	188.1	131.7

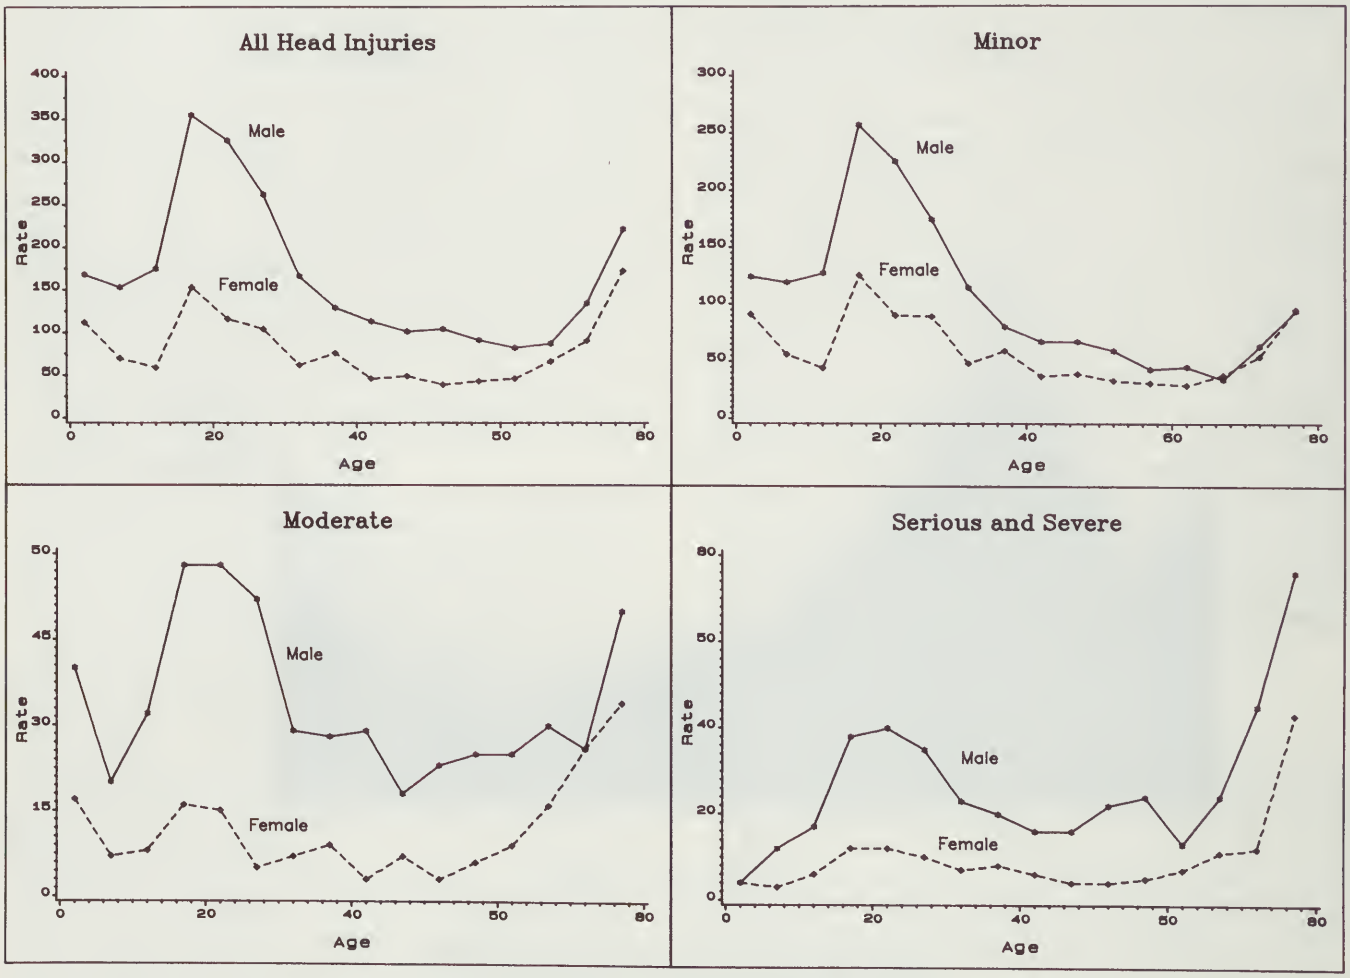

Figure 2. Head-Injury Discharge Rates (per 100,000) by Age, Sex, and Injury Severity (Maryland, 1986)

Comparison of discharge rates by race indicated little overall difference (128 per 100,000 for whites and 141 per 100,000 for nonwhites). This finding was consistent across all severity groups except for severe (ICD/AIS 5) injuries where whites were 1.6 times as likey as nonwhites to sustain a head injury. There were also significant differences in age-specific rates by race. White adolescents and young adults were almost twice as likely to be hospitalized for a head injury as were nonwhites of similar age. The peak in incidence in this young age group, however, was five years later among nonwhites (187 per 100,000 among ages 20 to 24) compared with whites (296 per 100,000 among ages 15 to 19). This five-year shift in peak incidence was similar for all severity groups. Between ages 25 and 75 rates among whites were generally lower than among nonwhites, although the differences were small (Figure 3).

Table 2. Head-Injury Discharge Rates (per 100,000) by External Cause and Severity (Maryland, 1986)

	Severity of Head Injury				
External Cause	Minor	Moderate	Serious	Severe	Total
Motor Vehicle	43.4	6.8	3.0	2.4	55.6
Pedestrian	5.8	1.7	0.4	0.4	8.3
Falls	21.8	7.6	4.0	0.9	34.3
Assault	8.7	3.5	2.0	0.5	14.7
Other	11.8	3.3	2.6	0.7	18.4
Total	91.5	22.9	12.0	4.9	131.3

Discharge Rates by External Cause of Injury and Severity Motor vehicle crashes and falls were the two leading causes of hospitalization for head injury. They resulted in 56 and 34 discharges per 100,000 population respectively (Table 2) and together accounted for over two-thirds of all head injury discharges. The risk of injury resulting from motor vehicle crashes versus falls differed according to severity of the head injury. Although both together accounted for approximately two-thirds of the injuries regardless of severity, the risk of falls versus motor vehicle crashes was slightly higher among those with moderate and serious injury as compared to those with minor and severe injuries for which the risk of motor vehicle crashes was over twice the risk of falls. As documented by previous investigators these patterns varied by age (Figure 4). The majority (70 percent) of head injuries among the elderly and young children were due to falls, whereas among adolescents and young adults, motor vehicle crashes

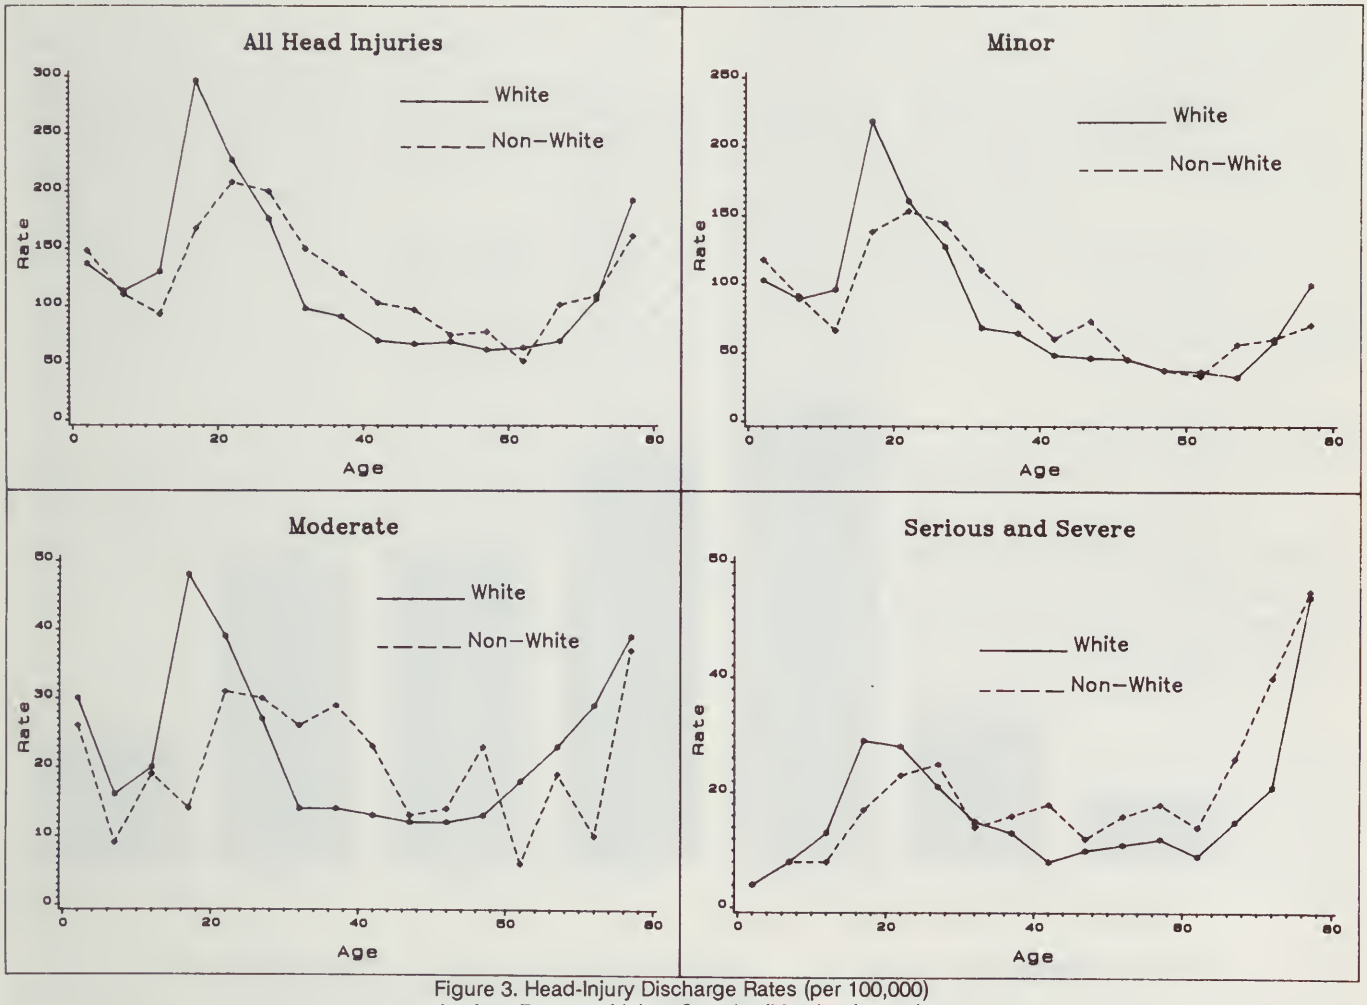

Figure 3. Head-Injury Discharge Rates (per 100,000) by Age, Race, and Injury Severity (Maryland, 1986)

accounted for 58 percent of the head injury discharges, assaults for 14 percent, and falls for only 11 percent.

Discharge Status by Age and Severity Of the 5,838 patients discharged with a head injury diagnosis, 258 (4 percent) died in the hospital (Table 3). An additional 6 percent were transferred directly to an extended care facility and 3 percent were transferred to another acute care facility. There is a strong correlation between status at discharge and ICD/AIS severity of the head injury. Among those with severe (ICD/AIS 5) head injuries, 48 percent died in hospital and an additional 24 percent were transferred directly to an extended-care facility. Among only the survivors of a severe head injury, 46 percent were transferred directly to an extended-care facility. These percents were considerably lower for those sustaining less severe injuries (AIS 1-4) where 3 percent died and 6 percent were transferred to an extended-care facility.

Discussion

The 1986 hospital discharge rate for head injury in Maryland was 132 per 100,000 population. These figures are somewhat lower than previously published estimates. In the most recent and methodologically comparable study, Fife *et al.* reported a 1979-1980 hospital discharge rate for Rhode Island of 152 per 100,000.[8] Kraus reported a 1981 rate of 160 per 100,000 for hospital discharges in San Diego County.[6] However, his definition of head injury included injuries to only the brain. National estimates of head injury hospital discharge rates have been reported as high as 200 per 100,000.[2] While these differences in rates are due in part to differences in case definition and case ascertainment methodologies, regional variations in true incidence may be a factor.

Table 3. Distribution of Discharge Status by Injury Severity (Head-Injury Discharges Maryland, 1986)

Discharge Status	Severity of Head Injury				
	Minor (percent)	Moderate (percent)	Serious (percent)	Severe (percent)	Total (percent)
Home	94	80	66	23	87
Transfer to acute care	2	4	7	5	3
Transfer to extended care	3	10	14	24	6
Died	1	5	13	48	4

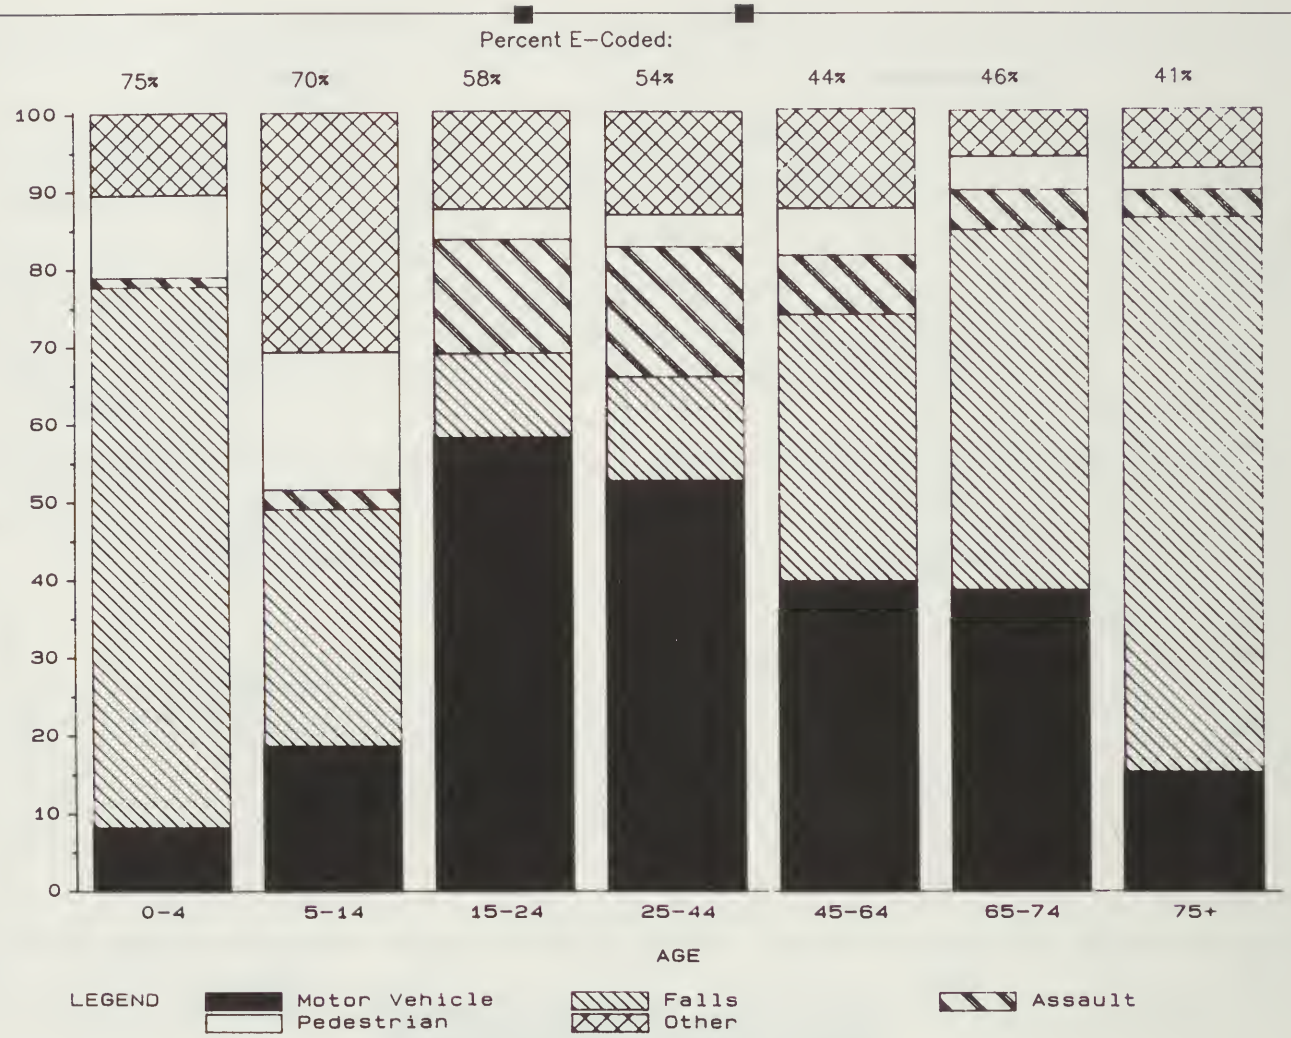

Figure 4. External Cause of Head-Injury Discharge by Age (Maryland, 1986)

Estimates based on the National Hospital Discharge Survey, for instance, indicate that while overall in 1986 there were 132 hospital discharges per 100,000 population with a first-listed diagnosis of a head injury (ICD 800-801; 803-804; 850-854) rates range from a low of 119 for the southern United States to a high of 150 for the Northeast.[16]

It should be pointed out that hospital discharge rates in general tend to overestimate the true incidence of head injury severe enough to result in hospitalization. This overestimation can occur for two reasons. First, transfers from one acute care facility to another are double counted, but the percent of all head injury discharges that are transfers is generally low (<2 percent). A second and potentially more important source of overestimation is the possible inclusion of individuals who were rehospitalized for follow-up care. To the extent these hospitalizations are classified by their principal diagnosis as "complications" or as "late effects" of the injury, they have been excluded from the count by definition. Some of these rehospitalizations will have a principal diagnosis with a valid head-injury code. These cases are not readily identifiable from the HSCRC discharge data. Hospital discharge data from New Zealand in which first admissions can be identified separately from readmissions, indicate that readmissions account for only 2 percent of all admissions with a principal diagnosis of a head injury.[17]

The distribution of head injuries by severity is similar to that reported by Krauss,[6] although the two studies are not directly comparable due to differences in methods of case ascertainment and definition of both head injury (Krauss included injuries to the brain only) and severity (Krauss used the Glasgow Coma Scale [GCS] to define severity). Krauss found that among all hospitalizations for brain injury, 9 percent were severe (GCS scores of 8 or lower); 9 percent were moderate (hospital length of stay of at least 48 hours and GCS 9-12, brain surgery, or an abnormal computerized axial tomography [CAT] scan); and 82 percent were minor (all other brain injuries). In this study 4 percent were ICD/AIS 5 injuries; 9 percent were ICD/AIS 4; 17 percent were ICD/AIS 3; and 70 percent were ICD/AIS 1-2 head injuries.

The findings of the present analysis agree with those of previous investigations with respect to overall pat-

terns of incidence by age, race, sex, and external cause.[1-11] What previously has not been published is a systematic examination of these patterns by severity of the head injury. Of particular interest are the findings that the elderly are at a particularly high risk of serious head injury involving intracranial hemorrhage. The conclusions of this study confirm Pentland and colleagues' comparison of 449 head-injured patients aged 65 and over who were admitted to the Head and Spinal Injury Unit in Edinburgh, Scotland, with a similar group of 1,571 head injury patients under 65 years.[18] They found a significantly higher percent of patients with intracranial hemorrhage among those aged 65 and over (9.4 percent) compared with their comparison group of younger patients (2.7 percent). The previously documented finding that elderly males and females are at equal risk of head injury appears to hold true for minor head injuries only. Elderly males continue to be at significantly higher risk than females for more severe injury.

Based on the data in our study it is projected that in 1990, if the hospital-discharge and case-fatality rates were to remain constant, about 5,764 Maryland residents will survive a head injury serious enough to require hospitalization. These projections were made by applying 1986 age-specific head-injury discharge rates for survivors to the Maryland population as projected by the Maryland Department of Health and Mental Hygiene. Although the majority (72 percent) of head injuries are minor, conservative estimates of the number who sustain AIS 3,4, and 5 head injuries are 917, 482, and 115 respectively.

But these are conservative estimates, there is evidence the rate of hospitalized head-injury may well be increasing. An analysis of the trends in the age-adjusted hospitalized head injury discharge rate has shown a steady increase of 3.4/100,000 population per year over all severity groups with the largest increase noted among the most severe.[19] The rate for ICD/AIS 5 head injuries nearly tripled over eight years from 1.7 per 100,000 to 5.0 per 100,000, whereas the rate for less severe injuries increased by less than 50 percent over the same time period. These increases have been accompanied by a decrease in the case fatality rate from 4.9 percent to 4.4 percent. If one were to project the number of survivors of head injury based on these observed trends, the estimates of the number of individuals surviving AIS 1-2, 3, 4, and 5 head injuries in 1990 are 4,702, 1,043, 553, and 132 respectively.

The individual and societal costs associated with severe head injuries are substantial. Several studies have documented the persistence of significant physical, neuropsychological, and psychosocial deficits following severe head injury in both children and adults.[20-32] Less is known about the residual effects of minor head injury, although there is increasing evidence to suggest that even minor injuries are associated with a constellation of physical symptoms such as persistent headaches as well as psychosocial and behavioral problems.[33-41] The needs of these individuals often are ignored, and yet they are large in number. Nevertheless, these statistics likely underestimate the magnitude of the minor head injury problem for two reasons. First, significant numbers of individuals who sustain head injuries are never hospitalized. Estimates based on the National Health Interview Survey (NHIS) indicate that well over one million people each year are treated for a skull fracture or intracranial injury in an Emergency Department or a physician's office.[42] Second, there is evidence that even among hospitalized patients, minor head injuries that are secondary to other traumatic injuries, especially spinal cord and orthopedic injuries, may be underreported.[43]

The findings of this study underscore the importance of head injury as a major public health problem in Maryland.

Although primary prevention of head injuries should be given the highest priority, there is also a need to ensure that those individuals who do survive a serious head injury receive adequate rehabilitation services.

The State of Maryland Echelons of Care Program has served for many years as a model of regionalized trauma care. Adequate rehabilitation is a vital part of the system if the good results of trauma surgical care are to result in better long-term outcomes and quality of life for those patients who survive.

Acknowledgments

The authors acknowledge the contributions of Drs. Antoinette De Fazio and Mark Kelly of the Montebello Rehabilitation Hospital. They are also grateful for the assistance of the Injury Prevention Center and the Academic Data Center of the Johns Hopkins School of Hygiene and Public Health in pursuing this research.

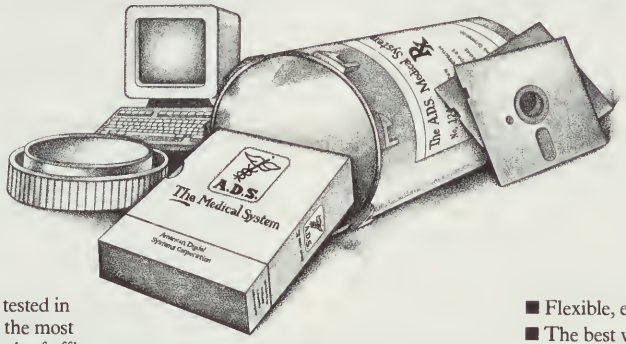
Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service.
1211 Cathedral St., Baltimore, MD 21201
Telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service.* Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.



There comes a time in every physician's practice when automation is no longer an option...it is a necessity. And, choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package that is physician tested and approved. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500 form billing and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management

- ❒ menu driven
- ❒ on-line help manual
- ❒ maintains patient information
- ❒ insurance billing (1500 form)
- ❒ walk-out superbill
- ❒ end of month bill
- ❒ statistical reports
- ❒ accounting reports
- ❒ unlimited technical support
- ❒ unlimited software upgrades
- ❒ unlimited office staff training
- ❒ automatic back-up and restore
- ❒ separate ICD-9 and CPT code databases
- ❒ multiple diagnosis and procedure transactions
- ❒ password protection to sensitive areas
- ❒ no annual fee for Med Chi members

Call the Medical Solutions Management representative at (301) 539-0872 or toll-free in Maryland at 1-800-492-1056.

For daily office headaches, take what doctors recommend.

The A.D.S. Medical System. It's been tested in medical offices for years and found to be the most effective and affordable remedy for all kinds of office headaches.

You know the headaches.

Mountains of paperwork. Appointment scheduling. Insurance forms and claim submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Now try the most effective and affordable cure.

The A.D.S. Medical System is a proven high performance, easy-to-use system that offers the features you need to fully automate your practice.

- Shortest training period of any system
- Top quality hardware/software service support
- Flexible, expandable multi-user reliability
- The best value available

Call for more information or a free demonstration.

Once you've examined our system, you'll find it's the best available cure for the headaches of managing and operating your practice.

The A.D.S. Medical System. It can make a practice perfect.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.

Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

Case Report: An Unusual Vibrio Infection

John B. MacGibbon MD

Dr. MacGibbon is on staff at Church Hospital and an Instructor in Medicine, The Johns Hopkins Hospital.

Nonclassical vibrio infections are being better diagnosed because of awareness of them; many of the newer vibrio infections are being better recognized because of more selective culture methods. These infections pose a risk to individuals who play and work in warm coastal waters as well as to those who eat raw or partially cooked seafood.

A 26-year-old Korean seaman was in his usual state of good health. Two days prior to hospital admission he developed severe epigastric pain and nausea but no vomiting. He then developed watery diarrhea as frequently as every 20 minutes. These symptoms persisted throughout the night. The following day and early on the morning of admission he still had severe diarrhea, felt weak and was doubled up in pain, and was taken to the emergency room.

Laboratory Tests

On examination he was found to be in considerable distress, dehydrated, and he had a high leucocyte count. His stools were watery, yellowish, with a few flecks of undigested food but no gross blood. Stool was negative for occult blood. A few leucocytes were seen on the smear. His white blood cell count was 13,700 with 53% polys, 18% bands, 19% lymphocytes, 3% atypical lymphocytes and 7% monocytes; hemoglobin 15.2, hematocrit 43.8, platelet count normal. Urinalysis was normal. Blood glucose was 91 mg/dl. Creatinine 1.0. The electrolytes were normal.

An x-ray of the abdomen revealed nonspecific bowel pattern with no free air. He was started on 5 percent dextrose and Ringer's lactate and admitted to the ward.

Physical Exam

A physical examination revealed a young man in considerable distress. He was afebrile, pulse 70 regular; respirations 15/min.; blood pressure 106/60, falling to 88/60 on standing. In pain, he was holding his stomach. Head, eyes, ears, nose, and throat were normal. The tongue was coated and dry, but the breath was not offensive. Chest, heart, and lungs were clear to percussion and auscultation. Abdomen revealed a slight generalized tenderness especially in the epigastrium and in the right and left lower quadrants. There was minimal guarding, no rebound tenderness, and no organomegaly noted; bowel sounds were markedly increased. Rectal examination was negative.

Laboratory studies were initiated and the patient hydrated with Ringer's lactate and 5 percent dextrose. The patient's diarrhea persisted. The abdomen became a little distended, and the abdominal x-ray on July 28, 1988 (two days after admission) showed an increased quantity of air in the small intestines with multiple air-fluid levels but no extraluminal air collection. Psoas shadows were symmetrical and normal. The abdominal sonogram showed the small intestine diffusely distended with fluid and hyperperistaltic. The gall bladder, liver, pancreas, and biliary tree appeared normal.

Because of the persistence of the diarrhea and lack of positive cultures at this stage, a sigmoidoscopy was performed. This was reported as unremarkable. The biopsy reports showed slight nonspecific chronic inflammation with associated lymphoid aggregates. The patient was started on Ciprofloxacin on July 28 and was continued at a dose of 500 mgm twice a day. This seemed to have little effect on his diarrhea, which persisted albeit to a lesser extent until July 30 when, although he still had some diarrhea, his abdominal pain was less, his general condition and appetite improved, and he was taken off the intravenous fluids. Oral feeding was commenced and tolerated well.

Upper gastrointestinal x-rays and small bowel studies were performed before discharge; they were described as being unremarkable. A culture of the stool obtained on admission grew normal fecal flora and a scant growth of vibriolike organisms sensitive to ampicillin, gentamycin, cefazolin, tetracycline, and trimethoprim-sulfa. These were isolated on August 1 and finally identified by the Maryland State Health Department as *Vibrio hollisae*.

Studies for ova and parasites were all negative as were viral stool cultures and stool cultures for other enteric pathogens *Campylobacter, Yersinia*, etc. The stool was re-examined and was negative for blood, and the smear showed only a few leucocytes.

Comment

I believe this is an example of a non-cholera vibrio diarrheal infection. Information regarding possible ingestion of raw or partially cooked seafood was not obtained. No other crew members were ill, but it is the habit of Koreans to eat raw crab on occasion. A more recent episode of eight cases of profuse diarrhea occurred on a Korean ship in the port of Baltimore last October. They had ingested raw meat three days before from crabs bought in Jacksonville. The symptoms were clinically those of a vibrio type of infection and came on 12 to 36 hours after inges tion.

V. hollisae has been implicated with diarrhea in man from the ingestion of partially cooked or raw seafood, especially oysters.[1] Diarrhea and abdominal cramps are a feature of infections with this organism; sepsis is usually not. However, a case recently was reported of *V. hollisae* sepsis in a 65-year-old man (an alcoholic and diabetic) who consumed a catfish bought live and caught 115 miles upstream in the Mississippi. (This was unusual as the *Vibrio* is halophilic and the salinity of the water 80 miles downstream was 0.5 percent, the minimum needs for growth of this organism; but it was pointed out that catfish can travel this distance and are adaptable to varying salinity.[2])

Recently a case of cellulitis was reported of non-0:1-vibrio infection occuring in a man with varicose ulceration exposed to fresh water contact in a Colorado lake. The lake water yielded non-0:1 *V. cholera* identical with that found in the wound and bullous fluid from the leg lesions. This would appear to be the first human wound infection with *V. cholera* from contact with fresh water reported in the United States.[3]

The non-0:1 vibrios and those vibrios causing human disease apart from the classical *V. cholera* have only recently been recognized. They include *V. vulnificus, Vparahemolyticus, V. mimicus, V. alginolyticus, V. furnissi, V. hollisae V. damsela* and possibly *V. metschnikovii*. These vibrios are halophilic (except *V. mimicus*) growing in 0.7-3 percent saline and are found as active, motile, gram-negative organisms. They are found in warm coastal seawater and in brackish tidal estuarine waters and lagoons.

Human disease appears to be contracted by contact with or consumption of raw or partially cooked seafood. In the case of *V. vulnificus* local lacerations while cleaning shellfish or other fish or by contamination of wounds with infected seawater may lead to cellulitis and septicemia. Not infrequently death may result.[4] *V. vulnificus* infections also can result from ingestion of raw or partially cooked seafood.

Serious septicemic disease seems to be more common in persons with chronic liver disease and those who area immunosup pressed. [4,5] It would seem prudent that persons with the above conditions avoid raw seafood and use care in the handling and cleaning shellfish especially in warm coastal areas.

Recently a case was reported of a 60-year-old man who fell in the waters of the Inner Harbor in Baltimore after suffering a cardiopulmonary arrest. After resusitation he developed pneumonia and sputum cultures grew *V. cholerae* and *V. vulnificus* and the blood cultures, vibrio species. He recovered after treatment with tetracycline and gentamycin. The patient had a history of alcoholism.[6]

While most of the vibrios can cause gastrointestinal illness others such as *V. damsela* and *V. alginolyticus* commonly cause wound infections, and cases of alginolyticus and mimicus are often implicated in marine acquired ear infections. Even 0:1 *V. cholera* has caused wound infection, and the non-0:1 cholera vibrios have been responsible for the whole spectrum of gas trointestinal, ear, wound, and septicemic infection. *V. parahemo lyticus,* a very common cause of outbreaks of infectious diarrhea in Japan, has been implicated in outbreaks in the USA and in occasional wound and ear infections but rarely in cases of septicemia.

V. furnissii, V. hollisae and *V. fluvialis* all seem to cause mainly gastrointestinal disease. The latter organism

may be identified in hospital laboratories as *Aeromonas hydrophila* so underreporting of this organism probably has occurred.[7] The gastrointestinal illness these organisms cause is usually a severe profuse watery diarrhea, occasionally with leucocytes and blood in the stool. Diarrhea may be accompanied by low-grade fever and abdominal cramps that can be quite severe. Nausea, vomiting, and headache may occur. Incubation varies from a few hours to several days. The diarrhea and severe symptoms may last from 72 hours to six or seven days.[7]

Most diarrheal infections are self-limiting. Treatment includes prompt and adequate hydration. Most vibrios are sensitive to the tetracyclines, the third-generation cephalosporins, and trimethoprim-sulfamethoxazole. Our patient's *V. hollisae* was sensitive to mezlocillin, cefotetan, cefazolin, gentamycin, tetracycline, and trimethoprim-sulfa. Sensitivity to Ciprofloxacin was not tested.

Most of this group is not usually sensitive to penicillin or to ampicillin. Infections with *V. vulnificus* merit the prompt and vigorous use of an appropriate antibiotic such as tetracycline and an aminoglycoside.[7] The efficacy of the quinolones has not been established.

Infection with vibrios always should be suspected given exposure to marine environment in appropriate climatic conditions from swimming, working, playing, or ingesting raw or partially cooked seafood, when the presenting symptoms are those of gastrointestinal illness, wound infections, cellulitis, ear infections, or septicemia.[8] Cautionary advice regarding these activities should be given to those at higher risk of serious illness, such as persons with diabetes, liver disease, alcoholism, and immunosuppression .[1,8]

The Personality Disorder Treatment Program of Sheppard Pratt Hospital

Very often, specialized inpatient evaluation and treatment is a critical step in the effective long-term care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Extended stay intensive inpatient treatment
- ☐ Intermediate stay crisis intervention
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychopharmacology evaluation and treatment
- ☐ Psychotherapy consultation

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

(301) 938-3800
6501 North Charles Street
Baltimore, Maryland 21285-5815

Sheppard Pratt

A Transient Granulocyte Killing Defect Secondary to a Varicella Infection

Carol A. Blank MD, James E. Nagel MD, William H. Adler MD, and Fred J. Heldrich MD

Dr. Blank is with the Department of Pediatrics at St. Agnes Hospital, Baltimore.

Drs. Nagel and Adler are, respectively, assistant and associate professors of pediatrics at The Johns Hopkins University School of Medicine. Dr. Nagel also is Medical Officer, NIA, NIH, Baltimore. Dr. Adler is Chief, Clinical Immunology, NIA, NIH, Baltimore

Dr. Heldrich is associate professor of pediatrics, The Johns Hopkins University School of Medicine and Chairman, Department of Pediatrics, St. Agnes Hospital, Baltimore.

A varicella infection in a previously healthy young girl was complicated by bacterial sepsis, arthritis, and osteomyelitis in multiple locations. This secondary complication caused by Staphylococcus aureus *was associated with a transient defect in granulocyte function and an alteration in the representation of CD4 and CD8 positive lymphocyte subpopulation. The mechanism responsible for secondary bacterial infections following varicella may be due to transient defects in granulocyte function.*

An eight-year-old black female was admitted because of fever and pain in the left hip, thigh, and forearm. Ten days prior to admission, she developed a pruritic, papulovesicular rash diagnosed as varicella. The rash appeared in successive crops over the first six days of her illness. On the sixth day of illness, four days prior to admission, she experienced spiking fever and chills, unrelieved by aspirin. The day of admission, she refused to walk because of pain in the left hip, and on examination, swelling of the left thigh was noted.

Her past health was described as good, without previous serious illness or hospitalization. Immunizations for diphtheria, tetanus, pertussis, and poliomyelitis were complete. Her growth and development had been normal, and she was performing well as a third-grade student. She had no known allergies.

The family (mother, father, and six-year-old brother) were in good health. All had varicella over the previous month without complication, and none had experienced this infection.

Physical Examination

Vital signs upon admission were temperature of 39.5°, pulse 140/minute, respirations 31/minute, blood pressure 90/50 mmHg, and weight 20 kg. On physical examination the patient was oriented, but appeared acutely ill and dehydrated. The skin and mucous membranes were dry. There was a generalized crusted rash without evidence of suppuration. Lesions varied from 1 to 2 cm in diameter. One vesicle was found. The ears were normal. The tongue was coated. The posterior pharynx was clear and tonsils were present. The sclerae were icteric.

Funduscopic examination was normal. Her neck was supple,

and there was no cervical lymphadenopathy. The heart sounds were of good quality and without murmurs. The lung fields were clear to auscultation and percussion. No rales were heard. The abdomen was soft with a smooth, nontender liver edge that was palpable 3 cm below the right costal margin. There was no splenomegaly. Bowel sounds were normal. There was generalized tenderness to muscle palpation, most marked over the left thigh and left forearm. Pitting edema was present on both lower extremities. There was swelling and tenderness at the left hip with limitation of motion in all directions. All other joints had a good range of motion. Neurologic examination was entirely normal.

Laboratory Results and Methods

The white blood cell count was 2700 with 2% segmented neutrophils, 48% band forms, 40% lymphocytes, 4% monocytes, 4% atypical lymphocytes and 2% metamyelocytes. Review of the blood smear showed moderate toxic granulation and vacuolization of the segmented neutrophils. Hemoglobin was 7.7 gm% and hematocrit was 22.6%. The erythrocyte sedimentation rate was 115 mm/hr. Sickle test was negative. Serum electrolytes were Na 118 mmol, K 3.8 mmol, Cl 85 mmol, CO2 20 mmol/L.

Urea nitrogen was 26 mg/dl, creatinine 1.2 mg/dl, and glucose 121 mg/dl. Lactate dehydrogenase (LDH) was 723 U, aspartate aminotransferase (SGOT) 206 U, alanine aminotransferase (SGPT) 43 U, and creatinine kinase(CK) 4378 U. Ammonia was 65 mcg/dl. Total bilirubin was 3.2 mg/dl with direct bilirubin 2.0 mg/dl, and indirect bilirubin 1.2 mg/dl. Cold agglutinin titer was 1:32. Varicella titer was greater than 1:256.

A radiograph of the left hip and left lower extremity revealed soft tissue swelling in the region of the left hip, but no evidence of an osseous lesion. A chest radiograph obtained 12 hours after admission revealed diffuse bilateral infiltrates. There was no pleural effusion.

The assays of the ability of granulocytes to kill Staphylococcus aureus bacteria were performed as follows in the third week of her febrile illness. Granulocytes were obtained from a heparinized blood sample by mixing the sample with 6 percent dextran solution (1:1) and allowing the red cells to settle for 60 minutes at room temperature. The serum-dextran layer was removed from the red cells and centrifuged at 800 rpms for 10 minutes. The cell pellet was washed twice with RPMI-1640 (GIBCO, Grand Island, NY) containing 5 percent fetal calf serum (NABI, Lenexa, KS). After washing, the cells were resuspended in the same media so that there were 1 x 107 granulocytes/ml. The S. aureus bacteria used for the assay were harvested from growth media by an 8000 rpm centrifugation for 10 minutes and washed twice with distilled water. The bacteria pellet was resuspended to an optical density of 0.6 at 610 mu. This suspension was diluted 1:50 with the RPMI-FCS media which resulted in about 5 x 107 bacteria/ml. Autologous serum used for the assay was diluted to 20% with RPMI containing 5 percent FCS.

The assay was performed in 12 x 75 mm siliconized glass tubes to which 0.05 ml of the leukocyte suspension, 0.4 ml of the 20 percent autologous serum, and 0.1 ml of the bacterial suspension were added. The incubation mixture was rotated for 90 minutes at 37° C. At the end of this time, 1 ml of the mixture was added to 1 ml sterile distilled water, mixed and poured into TSP blood agar plates. The plates were incubated overnight at 37° C. Controls were assay mixtures, not rotated, and kept at room temperature for the 90 minutes. Colony counts were done on the agar plates and percent killing determined from these counts.

The determination of lymphocyte subset representation was carried out as described previously.[1]

Hospital Course

On the night of admission, surgical drainage of the left hip yielded purulent material with gram positive cocci on smear. Intravenous nafcillin, 200 mg/kg/day, was begun, and subsequently, cultures of blood and joint fluid were reported positive for *Staphylococcus aureus*. Following surgery, the patient remained acutely ill with continued spiking fever. The patient developed abdominal distention, with reduced bowel sounds, persistence of generalized muscle pain, hemolytic anemia, jaundice, and a generalized macular erythematous rash. Although she remained normotensive, her symptoms were otherwise compatible with the toxic shock syndrome secondary to a S. aureus infection, which is also suggested by the subsequent desquamation of her generalized erythematous rash. A technetium bone scan obtained the day after admission was negative.

The patient remained febrile while on antibiotic therapy specific to the organism. Except for the initial blood culture, all other blood cultures were negative. Since there was no drainage from the left hip, the joint was reopened and packed open. The patient was transfused to achieve a hematocrit of 24 percent. The patient remained febrile with daily temperature spikes to 39.5° C. Antibiotic therapy was changed from nafcillin to vancomycin(50 mg/kg/d) and gentamicin (7.3 mg/kg/dl) without any clinical improvement.

During the second week of hospitalization, the patient began to complain of pain in the left thigh, which was noted to be tender in both the medial and lateral aspects. Sonography demonstrated a fluid collection in the left thigh. Subsequently, a 240 cc volume of purulent fluid was aspirated from that site; it grew *S. aureus* on culture.

The patient continued to complain of buttock pain during the next several days. A gallium scan showed uptake in the right hip. Another aspiration of the right hip yielded 8 cc of purulent material. The patient then underwent surgery to open and drain the right hip abscess and to re-explore the left hip, which revealed

no retained purulent material. The right hip joint was noted to have destructive changes at this time.

Postoperatively, the patient was started on nafcillin(235 mg/kg/day), rifampin (23 mg/kg/day), and vancomycin(50 mg/kg/day), but still remained febrile. Repeat bilateral hip radiographs were done after one month of hospitalization and showed posterior dislocation of the right hip. A repeat technetium bone scan done at the same time showed increased uptake in the proximal left humerus, proximal left femur, and posterior left tenth rib. Re-exploration of both hips showed retained purulent material in the right hip. Neither femoral neck contained purulent material in the medullary canal. No purulent material could be obtained from the left proximal humerus.

The patient continued to be febrile until the sixth week of hospitalization. Her varicella hepatitis, as determined by a return to normal of serum bilirubin and liver enzymes, had resolved by the tenth hospital day. The pneumonia, as determined radiographically, resolved by the fourth week of illness. The patient's erythrocyte sedimentation rate became normal by the eighth month of hospitalization.

In the fourth month of hospitalization, the patient developed a pathologic fracture of the right femoral neck. At that time, arthrography of the right hip showed a pseudoarthritis at the point of the pathologic fracture and fusion of the femoral head to the acetabulum. She was then placed in bilateral hip spica casts.

The patient's hospital course was further complicated by a hepatitis B infection following blood transfusion of packed red cells. The units of packed red blood cells infused had been screened for antibodies and were negative. The patient was found to be hepatitis B surface antigen positive, and hepatitis B core antibody positive in her fifth month of hospitalization. Liver enzymes, which had been elevated on admission, were within normal range at one week, but became elevated again by the fifth month of hospitalization and remained elevated during her remaining period of hospitalization. After the first week of hospitalization, serum bilirubin levels were never elevated. She also developed hypercalciuria due to immobilization in her third month of hospitalization; it resolved by the seventh month.

Studies undertaken to evaluate host defenses in this patient may have contributed to her inability to respond to the infection. Hemoglobin electrophoresis was normal. Glucose-6-phosphodehydrogenase (G6PD) was 2.8 U/ml.Serum IgA was 260 mg/dl (Normal 50-232 mg/dl), IgG 1800 mg/dl (Normal 700-1550 mg/dl), IgM 110 mg/dl (Normal 12-40 mg/dl), determined in the second week of hospitalization. A serum sample taken prior to transfusion showed a passive hemagglutinin antibody titer to tetanus toxoid of 1:20480, which was normal.

Results from a blood sample taken three weeks into the hospitalization showed a white blood cell count of 4600 with 80% segmented neutrophils, 16% lymphocytes, 2% monocytes, and 2% eosinophils. Lymphocyte subset representation showed CD3+ T cells = 66%, CD2+ (rosette receptor T cells) 76%, CD4+ (helper/inducer T cells) 29%, CD8+(suppressor/cytotoxic T cells) 34%, and surface immunoglobulin positive B cells 13% (Table 1). The responses of her lymphocytes *in vitro* to mitogen stimulation showed a background tritiated thymidine incorporation of 541 cpm with a PHA response of 273,708 cpm, a Con A response of 119,052 cpm, and a pokeweed mitogen response of 121,486 cpm, all of which are normal. The results of a S. aureus bacterial killing assay using the patient's granulocytes showed no killing in a 90-minute assay, while cells from a normal control showed 75 percent killing in the assay (Table 2).

Since the patient had a lymphopenia, the absolute numbers for the lymphocyte subset representation were low, but the percent representations for each subset within a normal range with a reversal of the 4/8 ratio. The results of the bacteria killing assay were abnormal at this time during her acute illness. After 2.5 months of hospitalization, her granulocyte function was restudied. Metabolic activity, as judged by NBT dye reduction, showed normal resting activity and a normal level of increased activity during phagocytic activation (resting OD = .148, stimulated OD = .393, OD = .245). A bacterial killing assay at this time showed a 94 percent killing of *S. aureus* in a 90-minute assay, a normal level of activity.

Table 1. Results of Blood Sample taken Three Weeks into Hospitalization

WBC 4600/mm^2
% Lymphs 16
Absolute lymphocyte number = 736/mm^2

Cell Marker	Cell Type	%	Absolute Number
CD2	Rosette receptor Positive T cell	76	559
CD3	T cells	66	486

Discussion

Varicella, a common, highly contagious viral infection, is usually a benign illness. However, there can be

an increased severity in neonates, immunocompromised children and adults.[2-4] Complications may occur in any patient with varicella, and several recent reviews have documented the frequency, severity, and age distribution in both previously healthy patients and those who are immunocompromised.[5-8] These complications fall into five general categories (Table 3): viral dissemination, post-infectious,bacterial infections, toxic encephalopathy (Reyes syndrome), and iatrogenic.

In younger, previously healthy children and with normal immune function, bacterial superinfections are the most frequent complications. Gram positive organisms, staphylococci, and streptococci are most frequently responsible for these infections.[3-8] While skin infections are seen most commonly, lymphadenitis, arthritis, osteomyelitis, pneumonia, and meningitis can occur.[8-13]

Although bacterial superinfection is recognized as a frequent complication in the healthy child, the reasons are unclear. A secondary bacterial infection of the pox lesion and skin may be caused by excoriation, which could result in bacteremia leading to generalized sepsis. Changes in host defense mechanisms have been identified in otherwise healthy patients with varicella that could predispose to bacterial superinfection. Recently, it was reported that gamma-interferon can influence granulocyte function. Any disruption of interferon production may result in a deficiency of granulocyte function. Such a disruption could be a consequence of an extensive viral illness.[14]

Patients in the acute stages of a varicella infection can show a reversal of the helper/suppressor cell ratio as was the case with this patient.[15] In normal patients with varicella, a difference has been shown in the ability of their lymphocytes to respond to varicella antigenic stimulation *in vitro*. Patients with mild disease had maximal lymphocyte responses immediately or within the first two weeks of illness, while those patients who developed meningoencephalitis had a delay in peak lymphocyte responsiveness.[16] These changes were not associated with an increase in bacterial complications.

Severe neutropenia and leukopenia of brief duration have been documented in a previously healthy patient with varicella.[17] Although bacterial complications did not develop the patient was treated with antibiotics.

Our patient showed evidence of impaired granulocyte function concomitant with bacterial superinfection. This deficiency occurred during a time when the viral illness resolved, but the bacterial superinfection with *S. aureus* persisted. During this time she received adequate amounts of appropriate antibiotics, and blood cultures remained sterile. However, despite therapy, multiple new sites of osseous infection appeared, and the patient remained febrile. She had no evidence of an immunodeficiency, a complement deficiency, T-cell abnormality, or underlying disease. Her granulocyte functional deficiency resolved in six weeks, and at that time, the bacterial infection was brought under control. These data suggest the varicella virus produced a transient secondary granulocytic functional deficiency by interfering with their bactericidal activity, which resulted in the protracted and complicated course of a serious S. aureus infection.

Table 3. General Categories of Complications to Varcella

1. Viral dissemination	
Pneumonia	Hepatitis
Meningoencephalitis	Arthritis
2. Postinfectious or autoimmune	
Arthritis	Polyneuritis
Thrombocytopenia	Nephrosis
Anaphylactoid purpura	Menigitis
Encephalitis	Myelitis
3. Bacterial infections	
Arthritis	Impetigo
Necrotizing fasciitis	Cellulitis
Osteomyelitis	Lymphadenitis
Sepsis	
4. Reyes syndrome (toxic encephalopathy)	
5. Iatrogenic	
Drug overdose

Dear Doctor:

Does your practice manager:

- know how to maximize your practice income?
- understand the recent changes in the Medicare program?
- have good audit control procedures in place?
- supervise the front and back office staff effectively?
- evaluate patient satisfaction and marketing efforts periodically?

If you are not certain, recommend that your manager join **MARYLAND MEDICAL GROUP MANAGEMENT ASSOCIATION** — "The Organization for the Medical Practice Professional."

Cardiac Transplantation in a Regional Center: Goals and Results at Two Years

Nelson A. Burton MD; Edward A. Lefrak MD; John A. Miller MD; Linda Ohler RN, MSN; and Mary Beth Foehring RN

From the Departments of Surgery, Medicine, and the Cardiac Transplantation Program of The Virginia Heart Center at Fairfax Hospital Fall Church, VA. Reprints: Dr. Nelson A. Burton, 3301 Woodburn Road, Ste 301, Annandale, VA 22003.

Cardiac transplantation moved from the realm of an investigational procedure to a therapeutic modality in the early 1980s. While one-year survival of 80 percent or greater can be expected, close follow-up is required to monitor for rejection, infection, and other late complications. With the need for close surveillance, both short and long-term, improved patient access to the transplantation center based on geographic proximity allows enhanced care by the original transplant team.

Cardiac transplantation as treatment for end-stage heart failure was initiated over 20 years ago. Enthusiasm for the procedure was quickly extinguished by dismal early results, and virtually all major programs had abandoned the operation by the early 1970s. The careful, persistent, and pioneering work of Dr. Norman Shumway and his colleagues at Stanford, however, proved the efficacy and utility of cardiac transplantation even before the introduction of cyclosporine. With such important developments as antithymocyte globulin, retransplantation for atherosclerosis, long-distance procurement, and endomyocardial biopsy, survival approaching 67 percent at one year was achieved.[1] With the introduction of cyclosporine in December 1980, one-year survival improved to over 80 percent.[2] Decreased morbidity from infection and other steroid-related complications allowed expanded patient selection.[3] These improved results led to a rapid dissemination of heart-tranplant programs across the United States to more than 130 in 1988.[4]

While the "ideal" number of centers performing heart transplant may be difficult to define, there are certain real and potential advantages for the regionalization of heart transplantation to local centers including

1. improved access for patients
2. better long-term folllow-up based on this proximity
3. heightened local awareness of organ transplant needs

If local programs perform cardiac transplantation with results comparable to large university based referral centers, the overall economic advantages as well as those just listed would encourage the maintenance of such regional programs. With these concepts in mind the Virginia Heart Center at Fairfax Hospital initiated a locally based cardiac transplantation program in December 1986.

Organization and Development

The cardiac transplantation program at Fairfax Hospital had its inception in June 1984, two-and-a-half years before the first car-

diac transplant was performed. The organizing physicians in the transplant team were a cardiac surgeon, an immunologist, and a cardiac pathologist. Subsequently this core of physicians expanded to a admit a number of other specialties including cardiology, infectious disease, and psychiatry. Representatives from nursing, hospital administration, dietary services, pharmacy, physical therapy, social work, security, public relations, and housekeeping were involved in planning at the earliest stages. Protocols were developed and put in place for both inpatient and outpatient care of the transplanted patient.

In this early stage, extensive on-site visits to several well-established heart transplantation programs across the country proved very helpful. To prepare and train the surgical team, the operations of both donor heart removal and subsequent transplantation were performed on human cadavers in the Fairfax Hospital morgue with the informed consent of family members. In addition, through the Washington Regional Transplant Consortium, intensive efforts were directed to (1) increase public awareness of the importance and need for organ donation and (2) to assist the medical community in transforming this awareness into more effective organ procurement.

Evaluation

Patients referred to the Virginia Heart Center at Fairfax Hospital with end-stage heart disease are evaluated in a systematic fashion for cardiac transplantation over a two to three-day period. Cardiac function of these patients initially is studied and optimized by transplant cardiologists along with concurrent evaluations by other members of the transplant team.

Cardiac catheterization is performed when needed, with special attention directed to the pulmonary vascular resistance. If elevated, its severity and potential reversibility are assessed by administration of intravenous vasodilators such as nitroprusside and prostaglandin E1. Significant and unresponsive elevation of pulmonary vascular resistance is associated with a high risk of early right heart failure in the donor graft, which is often fatal.[5]

Myocardial biopsy is performed when myocarditis is a potential cause of acute heart failure or to rule out systemic diseases such as amyloidosis or sarcoidosis. Consultants in infectious disease and immunology thoroughly review the patient's serology to evaluate past exposures, sensitizations that could lead to increased graft rejection and the need for pretransplant immunizations. Psychiatrists, social workers, and (if indicated) drug rehabilitation personnel carefully screen patients and their families to discover psychological, emotional, or social problems that might preclude cardiac transplantation. If other medical conditions coexist, appropriate additional specialists are consulted.

When the evaluation has been completed, the Heart Transplantation Review Committee reviews the history and findings of each consultant in detail to determine the appropriateness of heart transplantation for the patient. This committee includes consultants from cardiology, infectious disease, and immunology as well as representatives from surgery, social work, nursing, hospital administration, anesthesia, and the clergy.

Recipients

From December 1986 to March 31, 1989, 106 patients have been referred to Fairfax Hospital for evaluation as possible transplant candidates. Thirty-four patients were accepted for transplantation: 6 women and 28 men. All patients accepted for heart transplantation had documented evidence of severe left, right, or biventricular dysfunction. The severity of left ventricular dysfunction was manifested by a mean ejection fraction of 12 percent (range 5 to 20 percent). The etiology of heart disease was ischemic in 16, idiopathic cardiomyopathy in 14, valvular heart disease in 2, myocarditis in 1, and congenital heart disease in 1. Four of 34 patients accepted for cardiac transplantation died before an appropriate donor heart became available. Currently, there are 7 patients waiting who have been on the list for 1 to 8 months, and one patient was removed from the list for nonmedical reasons.

Twenty-two patients have undergone cardiac transplantation. The median waiting time for a donor heart was 41 days (range 1 to 213 days). The mean age of patients transplanted was 43 years (range 17 to 57 years). More than half the 22 patients receiving transplants (12) were dependent on one or more intravenous inotropic medications or the intra-aortic balloon pump while awaiting transplantation.

Twenty-one of the 22 donor hearts came from hospitals within our own geographic region with only one heart coming from a distant site in Ohio. The average donor age was 25.9 years with a range of 14 to 39 years. The mean period of time the donor hearts were deprived of coronary blood flow (ischemic time) was 1 hr 46 min (range 56 to 179 min).

Surgery

The operative technique for cardiac transplantation is basically that developed in the experimental laboratory nearly 30 years ago by Drs. Lower and Shumway[6] and later modified by Dr. Barnard.[7] After the ascending aorta is cross-clamped, one liter of cold crystalloid cardioplegic solution is delivered proximal to the clamp to preserve the donor heart. The heart is removed by dividing all the vascular connections. This initial cooling is maintained by packing the heart in cold saline-filled bags that are stored in ice during transport to Fairfax Hospital where the recipient has simultaneously been placed on cardiopulmonary bypass. Following excision of the recipient's heart, the donor heart is sewn into place with a series of four anastomoses joining the atria and great vessels. Inter-

mittent application of cold saline during the procedure is used to manintain preservation of the donor heart. No additional cardioplegic solution is administered. Swan-Ganz catheters and left atrial pressure lines are avoided in the recipient. The endotracheal tube, intravascular lines, the Foley catheter, and chest tubes are removed within 24 hours (if possible) to reduce the risks of infection.

Immunosuppression

The immunosuppressive protocol at Fairfax Hospital utilizes cyclosporine, azathioprine, and corticosteroids. The cyclosporine dose is adjusted according to blood levels, steroids initially are given in high doses followed by a gradually tapered dosage schedule, and azathioprine is started at 2 mg per kg with adjustment as needed based on the white blood cell count.

Patients undergo weekly endomyocardial biopsies in the first 8 to 12 weeks following cardiac transplantation. The frequency of biopsies then drops to once every three months by the end of the first year. Each biopsy specimen is stained with hematoxylin and eosin and is graded on a scale from 0 to 10.[8] For the first four weeks specimens are also stained for immunofluorescence to look for antibody mediated vascular or humoral rejection.[9]

Treatment of rejection is based on the severity of rejection and the interval following transplant. Options used to manage rejection include

1. augmented oral prednisone
2. intravenous methylprednisone
3. antithymyocyte globulin or monoclonal antibody, OKT3.

Emphasis is placed on individually tailoring the antirejection treatment to the specific situation to avoid excessive immunosuppression and the consequent increased risk of serious infection.

Outpatient Care

As most patients are discharged from the hospital two to three weeks following transplant, close outpatient follow-up is critical. Early focus is on the adjustment of immunosuppressive medication and close monitoring for signs of rejection or early infection. Patients are enrolled in comprehensive rehabilitation programs emphasizing exercise and proper diet. Management of hypertension is treated by decreasing the cyclosporine to the lowest dose that achieves a satisfactory blood level, tapering steroids where possible, and using specific therapy with the calcium channel blocker diltiazem supplemented by angiotensin-converting enzyme inhibitors, enalapril or captopril, as needed. Hypercholesterolemia is managed by a low-fat, low-cholesterol diet, decreasing steroids, and the addition of gemfibrizil as needed. Four months after heart transplantation, cardiac catheterization is performed and is repeated on an annual basis with special attention given to coronary angiography because of the risk of accelerated atherosclerosis in transplanted hearts.

Results

Twenty-two patients have received heart transplants at Fairfax Hospital; of these, 21 are survivors (95.4) (percent) from 2 to 27 months (mean follow-up, 13 months). One patient with severe biventricular failure and pulmonary hypertension died in the operating room from acute right heart failure of the donor heart. The other 21 patients have been discharged from the hospital. All patients have resumed an active life including full-time employment, school, or other gainful activity.

There have been 50 episodes of rejection; none were associated with hemodynamic deterioration. Thirteen of these (26 percent) occurred within the first four months after transplantation. When rejection occurred it was treated by one of the above-mentioned therapeutic regimes and reversed successfully in each instance. Two patients have had no rejection.

Serious infections requiring hospitalization and IV antibiotics have occurred 7 times. In addition, 20 infections were considered minor; nine were mucocutaneous herpes infections. The majority of infections (16) occurred within the first four months postoperatively. Eight patients (36 percent) have not had infections. There have been no deaths from infection. Malignancy has occurred in three patients. One patient had a small basal cell carcinoma removed from his nose. Two patients have developed lymphoma and are undergoing treatment including acyclovir and chemotherapy.

Discussion

The medical management of patients with symptomatic congestive heart failure has been frustrating and frequently futile. It has been estimated that nearly 200,000 patients die each year from congestive heart failure in the United States.[10] Depending on the degree of disability and the presence or absence of ventricular arrhythmias, one-year mortality in symptomatic patients can range up to 90 percent.[11,12] In a recent study of patients with profound congestive heart failure NYHA Functional Class IV, half the patients followed had died within a year and nearly two-thirds within two years.[11] Large multi-institutional trials of vasodilators, including hydralazine, isosorbide dinitrate, and enalapril, have shown promise but have not dramatically lengthened survival or significantly improved the quality of life.[13,14]

In contrast to the poor prognosis and marginal quality of life in patients with end-stage congestive heart failure treated medically, the results with cardiac transplantation have continued to improve. One year survival of 80 percent is expected, and better than 90 percent survival in the first year is not uncommon.[15]

Three-year survival is in the range of 70 to 80 percent.[16] Quality of life also improves dramatically. Patients nearly bedridden prior to transplantation are able to return to work, pursue their schooling, and spend time with their families and avocations. While there is need for lifelong immunosuppression, close follow-up, and occasional hospitalization, the vast majority of patients are extremely satisfied.

When cardiac transplantation was being developed, it was performed only in large research-oriented medical centers. With improving results, decreasing morbidity, and more accessible technology, cardiac transplantation has become a widely accepted therapeutic modality for end-stage heart disease. Excellent results were achieved and reported by private institutions in the 1980s.[17] The increasing number of such institutions performing cardiac transplantation within the vicinity of the patient's home has some distinct advantages related to proximity.[18] Families are relieved of the additional stress of having to relocate or of being separated from family members, finding themselves in unfamiliar surroundings, adding to the already significant stress of facing a heart transplant. After transplantation early and long-term follow-up is improved as the patient remains close to his/her transplantation center, eliminating hundreds of miles of travel for evaluation, biopsy, and follow-up. Referring physicians have better access to transplant physicians and are able to supplement care in the preoperative and postoperative period. Complications, such as infection or rejection, can be recognized quickly and treated in an expeditious and less costly fashion.Throughout their entire transplantation process, patients are in the familiar setting of home with family and friends nearby.

Increased donor awareness and a subsequent increase in the number of organ donors also has followed the establishment of a regional cardiac transplantation program in our area. The use of "local" donors for "local" patients has the advantage of decreasing the expenses associated with organ procurement as well as decreasing cold ischemic times, which limits myocardial injury.

We have shown that with careful preparation, a privately based regional cardiac transplantation program can achieve results equal to the best transplantation centers in the country, contrary to critics who fear poor survival in non-university based transplant programs.

These results further demonstrate that heart transplantation at a regional center such as Fairfax Hospital not only is less costly but also less disruptive for patients and their families. These benefits can lead to improved patient care and comfort as well as potentially increased survival.

ARMY RESERVE MEDICINE. BE ALL YOU CAN BE.

THE LOWER RESPIRATORY TRACT—

More vulnerable to infection in smokers and older adults

Experience counts

Ceclor® Pulvules® 250 mg

cefaclor

think of it first

For respiratory tract infections due to susceptible strains of indicated organisms.

Summary.
Consult tha package literature for prescribing information.

Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Streptococcus pyogenes* (group A β-hemolytic streptococci).
Contraindication: Known allergy to cephalosporins.
Warnings: CECLOR SHOULD BE ADMINISTEREO CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:
- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:
- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] and toxic epidermal necrolysis or the above skin manifestations accompanied by arthritis/arthralgia, and frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.
- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%, and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology
- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest® tablets but not with Tes-Tape® (glucose enzymatic test strip, Lilly). [061088L]

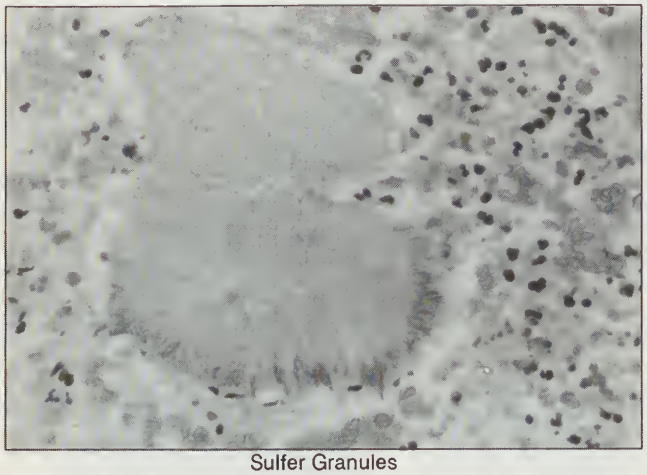
Case Report: Hepatic Actinomycosis

Neil D. Goldberg MD, William C. Anthony MD, Michael C. Yen MD, and Shoab Hashmi MD

From the Department of Medicine, Maryland General Hospital. Dr. Goldberg is clinical assistant professor of medicine, University of Maryland, and Chief, Division of Gastroenterology, Homewood Hospital South. Dr. Anthony is Head, Division of Infectious Diseases, Maryland General Hospital and Church Home Hospice; and assistant Program Director, Department of Medicine, Maryland General Hospital; and Head of Nephrology, Maryland General Hospital.

Primary hepatic actinomycosis is seldom seen, and almost all cases have been diagnosed by laparotomy. Treatment with high-dose parental penicillin for prolonged periods is recommended. In the past concomitant surgical drainage also has been recommended, but the nonoperative success reported here and by others suggests that surgical drainage is not essential to the treatment.



Primary hepatic actinomycosis is rare, and almost all cases have been diagnosed at laparotomy.[1] We report the case of a 38-year-old man who had chronic pancreatitis who presented with right upper quadrant pain, fever, and weight loss of three months duration. Ultrasound of the liver biopsy demonstrated multiple sonolucent defects with internal echos. Liver biopsy was diagnostic of actinomycosis. The patient responded to 90 days of high dose penicillin therapy.

The patient, an alcoholic with chronic pancreatitis, peptic ulcer disease, and internal drainage of a pancreatic pseudocyst three years ago, presented with a history of fever, weight loss, and right upper quadrant pain. The patient was on insulin NPH 10 units q.a.m. and no other medications. He admitted to heavy alcohol use up until three weeks before admission.

Physical examination showed his weight was 113 lbs, height of 5 ft 10 in and temperature was 100°. The examination demonstrated a cachectic, nonicteric black man, who appeared chronically ill. There was no peripheral adenopathy. Cardiopulmonary examination was unremarkable. The liver was 13 cms to percussion palpation in the mid-clavicular line with a smooth tender edge. The spleen was not palpable. No other masses were noted, but there was slight abdominal distension with hypoactive bowel sounds but no evidence of ascites. The stool was hemoccult negative.

Pertinent laboratory data showed white blood cell count (WBC) 12,400, SEGs 81, BANDS 1, lymphs 12, monos 3. Hematocrit 24.8, bilirubin 0.4 mgs, alkaline phosphatase 253 (normal 41-133), SGOT 21, SGPT 4, albumin 2.8, globulin 5.0, amylase 155, and sed rate 68.

Ultrasound of the abdomen demonstrated multiple sonolucent defects in both lobes of the liver with internal echos. These defects also were noted on liver and CT scans. Liver biopsy demonstrated a collection of PMNs, debris, and sulfur granules consistent with

Sulfer Granules

liver abscess associated with actinomycosis (see photo micrograph). Barium enema was unremarkable with normal appearing terminal ileum and appendix. Upper gastronintestinal and small bowel series showed loops of small bowel with fixed loops suggestive of multiple adhesions, but no mucosal abnormalities were evident. The patient initially was treated with aqueous penicillin G 9,000,000 units daily. After four days, the fever and right upper quadrant pain persisted and the pencillin was increased to 18,000,000 units daily; he became afebrile within 24 hours. The penicillin was continued for 90 days, and there was no recurrence of the fever. The patient gained 15 pounds. His albumin rose to 3.5. Follow-up liver and CT scan demonstrated no evidence of intrahepatic defects.

Discussion

Actinomyces israelii is a gram positive filamentous branching rod that grows best anaerobically, but many strains are microaerophilic and some grow aerobically.[2] Confirmation of actinomycosis is based on culture or the characteistic histologic appearance of sulfur granules in which branching bacilli are seen with brown and green stain.[3] Sulfur granules alone are suggestive but not diagnostic with similar structures seen in nocardiosis, aspergillosis, and coccidiomycosis.[4] The organism is an endogenous saprophyte inhabiting the mouth and the gastrointestinal tract. It invades deeper structures only when normal barries are disturbed.[5] The three main forms of the disease are cervicofacial, thoracic, and gastronintestinal. It presents as a chronic generalized inflammatory process with fever and leukocytosis. There is no racial or geographic predilection. Abdominal actinomycosis usually occurs in the setting of antecedent emergent laparotomy, appendicitis being the most common. In Putnam *et al.* analysis of 122 cases of abdominal actinomycosis, the liver was involved secondary to direct extension of the chronic suppurative inflammation. Portal venous spread is another presumptive route.

Primary hepatic actinomycosis is seldom seen. It is difficult to label our patient as being primary without laparotomy. His prior pancreatic pseudocyst drainage may well have been a predisposing factor. Treatment with high-dose parenteral penicillin (10 to 20 million units) for prolonged periods is recommended. Doxycycline is the alternative in pencillin-allergic patients. In the past concomitant surgical drainage has been recommended. The nonoperative success reported here as well as by Von Marion[1] suggests that surgical drainage is not essential to the treatment of hepatic actinomycosis.

Learning

Center

The American College of Cardiology has been providing continuing medical education to cardiovascular specialists for over 15 years. Attending programs at the Heart House Learning Center is a unique and convenient way of keeping abreast of the latest advances in cardiovascular medicine.

Continuing medical education is imperative for today's medical community and the Learning Center offers an extraordinary and stimulating environment for you to continue your medical education.

The Classroom at Heart House is equipped with 69 Learning Center Chairs, each of which is fitted with a television monitor for viewing videotapes, slides and graphs; a computer response system for evaluating participants' progress; and a tape recorder jack for taping various aspects of the program. The Classroom itself houses, among other things, satellite transmission capability for experiencing actual procedures, as they happen, without leaving your individual learning station. The size of the Classroom affords you an exceptional opportunity to interact with the faculty as well as your fellow participants.

Heart House, the national headquarters of the American College of Cardiology, has been located in Bethesda, Maryland for over 10 years. Its proximity to the National Institutes of Health, the National Library of Medicine and downtown Washington, D.C. has proven to be very beneficial to those attending Learning Center programs.

For more information on the programs being offered at Heart House, please call the Learning Center at 1-800-253-4636 ext. 241 (in Maryland or outside the United States, 1-301-897-5400).

The Value of a Broker

Problem: A physician insured becomes disabled. Two months later, upon learning he cannot return to practice, he requests cancellation and a refund of premium backdated to the date of disability. His insurance company will only cancel as of the date of his written request.

Solution: William C. Garrett represents his client's interest and the insurer establishes a new rule applicable to the physician and all future cases which provides a 90-day grace period for such notifications.

Problem: Three surgeons in a group practice face a major rate increase *plus* proportionately higher premiums which reflect the liability of a fourth partner who had recently retired.

Solution: William C. Garrett recommends a professional reorganization so the three surgeons can take advantage of their insurance company's "cancellation/buy-out" provision and start over with a first year rate a month *before* new rates go into effect. The end result—a projected $200,000 savings over a three-year period.

Learn why physicians across Maryland have been depending upon William C. Garrett for over 20 years. It pays to deal with a specialist who represents carefully chosen medical malpractice carriers! Write or call:

Newer Concepts in the Management of Disseminated Prostatic Cancer

Cancer of the prostate is the most common cancer in males,[1] and the majority of the patients diagnosed as having cancer of the prostate are in advanced stages. Currently, the treatment of this group of patients is based on androgen deprivation by either orchiectomy or use of newer analogues of luteinizing hormone-releasing hormone (LHRH). Since the introduction of hormone dependency of the prostate cancer by Huggins and associates,[2] very little progress has been made in the therapy of disseminated prostatic cancer.

Recently the potential for achieving a "medical" castration using potent (LHRH) analogues has been encouraging. These compounds stimulate endogenous gonadotropin and androgen release when administered acutely, but chronic therapy with pharmacological doses induces the paradoxical effect of inhibition. This appears to be a promising new class of agents for the treatment of various hormone dependent diseases, especially prostatic cancer.

The growth of prostatic epithelium depends on the presence of testosterone and 5-alpha-reductase. This enzyme converts testosterone to its active form, dihydrotesterone (DHT). The DHT binds to an androgen receptor and is carried to the nucleus where it binds to the nuclear chromatic to signal the synthesis of a particular protein. Removing the testosterone and retarding the growth of prostate epithelium can be accomplished by orchiectomy, suppressing of lutenizing hormone (LH), or blocking androgen synthesis or its effect at the cellular level.

Frequent low doses of LHRH and its agonists activate gonadotropin secretion. However, continuous infusion of LHRH causes inhibition of follicle - stimulating hormone (FSH) and LH. The suppression of serum LH and testosterone (T) will follow the initial stimulating effect. This temporary elevation of serum LH and T is responsible for initial flare reaction. However, by the fourth week of therapy with LHRH, the LH, FSH, and T levels will drop. The serum T lowered the level of castration (50 ng/ml). LHRH agonists are used clinically in disseminated prostatic cancer, cryptorchism endometriosis, and precocious puberty.

LHRH was isolated and characterized by Schally and associates in 1972.[3] It is a decapeptide that by substitutions of amino acids in the sixth and tenth positions may render agonists up to 100 times more potent than the parent compound. There are a number of LHRH agonists available.

Several multicentric intergroup studies randomizing disseminated prostatic cancer to either orchiectomy or to LHRH arrived at the following conclusions:

1. Endocrine therapy provides a dramatic response in Stage D2 prostatic cancer.[4-5]

2. No convincing study is available for the timing of therapy of disseminated prostatic cancer.

3. There is no evidence that endocrine therapy prolongs the survival of patients with stage D2 prostatic cancer.

4. LHRH has less side effects compared with other forms of endocrine therapy including diethylstibestrol. Furthermore, a depo-compound will eliminate the need for daily administration of these compounds.

However, the side effects of LHRH include impotence and flare-up of the symptoms. The flare reactions at the beginning of the therapy include increased bone pain, spinal cord compression, lymphedema, obstructive uropathy, and increased serum creatinine.

Another new concept of therapy of the disseminated prostatic cancer is total androgen blockage after orchiectomy or LHRH therapy using antiandrogen agents. These agents include flutamide, aminogluthatamide, and cyproterone acetate. Flutamide has been tried in various control studies. In a prospective, randomized study the effect of 750 mg of flutamide has been compared with 3 mg of daily diethylstilbestrol in the management of 40 previously untreated patients with disseminated prostatic cancer. It was reported that after 12 months, a response was demonstrated in 13 of 20 patients receiving flutamide as opposed to 8 out of 20 patients receiving diethyl stilbestrol. Although the difference was not statistically significant, the diethylstilbestrol arm of the study showed more severe side effects than did the flutamide arm.[6]

A prospective, randomized, placebo-controlled trial sponsored by the NCI compared to the effects of LHRH with or without antiandrogen. Six hundred seventeen patients with untreated disseminated cancer entered this study. The median survival for LHRH alone was 27.9 months; when antiandrogens were added the median survival was 34.9 months (Table). The flared reactions were not observed in combined androgen blockage arm.[7]

TAX RELIEF

Have You Ever Earned Interest on Taxes You Paid to the IRS?

You can have Interest Bearing Savings and pay tax on the annual interest or defer the tax

For example:

	$100,000 Bank Deposit *Earning 9% (Taxable)*	vs	$100,000 Insurance Company *Earning 9% (Tax Deferred)*
Account Value *			
Year 10	$169,202		$ 236,735
20	286,294		560,435
30	484,416		1,326,745

Annual Income assuming 9% interest and no depletion of principal:

484,416 x 9% = 43,597 vs 1,326,745 x 9% = 119,407

It's a basic principle: The greater your principal, the greater your income. This is accomplished through tax deferral rather than current taxation.

* Tax Bracket Assumed = 40%

Music Medicine Clearinghouse-Progress Report

In September, 1988 the International Clearinghouse for Resources and Publications on the Medical Problems of Musicians was established by the Medical and Chirurgical Faculty's House of Delegates. The Music Medicine Clearinghouse is staffed by a professional librarian and guided by an advisory board of local physicians with interest and experience in the field of music medicine.

Among the initial board members were physicians with ties to a performing arts medicine interest group at The Johns Hopkins University Medical Center, the Baltimore Symphony, the American Occupational Medical Association, and the International Arts-Medicine Association.

Music medicine is a relatively new field, having emerged within the last ten years. Publications concerning medical problems of musicians, however, date back several hundred years and are widely scattered throughout the medical, musical, and popular literature. Until recently there was very little cross-fertilization between the two disciplines. A journal, *Medical Problems of Performing Artists*, now in its third year of publication, has begun to bring researchers and information together. Prior to the establishment of the Clearinghouse, however, there was no single, centralized source for this information.

The primary mission of the Clearinghouse is to gather, organize, and disseminate information on musicians' medical problems to physicians, musicians, allied health personnel, and researchers. The collection will encompass published information of all types: books, periodicals, audiovisuals, rare and historical items, and archival materials. The collection will include both traditional and alternative therapies. The information will be made available as widely as possible, both in print and computerized forms. The collection is expected to be a catalyst for further research and publication. The Clearinghouse will be a vital force in cooperation among related arts medicine organizations.

The nucleus of the Clearinghouse is a collection of more than 500 reprints, about a dozen books, and a large file of ephemeral material. It includes brochures, newsletters, fact sheets, handouts, and several video and audio tapes. The goal is to acquire an original copy of every related publication.

The Clearinghouse has a nearly complete file of the International Arts-Medicine Association's newsletters, including several special supplements, and other information about this organization. The National Flute Association's Dysfunction Committee is represented by a brochure and information developed for presentations and exhibits. There are files of advertizements for past and upcoming music medicine conferences. The Clearinghouse also maintains a list of arts medicine clinics throughout the country, as well as brochures and newsletters from some of them.

The Clearinghouse provides an ongoing bibliography of citations dealing with music medicine and prepares subject bibliographies on specific subtopics. A version of the bibliography appeared in *Medical Problems of Performing Artists* in 1987, with one update in 1988.

The bibliography is being further computerized, allowing faster, easier preparation of subject bibliographies and the ability to provide updating services to those who regularly use the bibliography. Since the database includes medical, musical, and popular literature, it is unlike any other currently available. Quality control is ensured because the Clearinghouse maintains a copy of everything in the database and the contents of each item is verified before entry.

The Clearinghouse has a section on the Medical and Chirurgical Faculty's Computer Bulletin Board (MedSig) where physicians can discuss the new field of music medicine. Information about conferences, short bibliographies, and other files will be available through the bulletin board. It is also an opportunity for musically inclined computer buffs to advise the Clearinghouse of new publications and materials for the collection.

The Clearinghouse staff and board are working to broaden the collection and publicize its value. A Clearinghouse brochure was distributed at the Conference on Wellness for Performing Musicians sponsored by Catholic University in January and at a Montgomery College pedagogy workshop in May. There will be a Clearinghouse exhibit at the National Flute Association's annual conference this summer.

Three of the biggest names in the field of music medicine have visited the Clearinghouse since its founding. Alice Brandfonbrener MD, of Chicago appeared at the Clearinghouse dedication in September as part of a larger Arts Medicine Weekend in Baltimore. She called the collection the only one of its kind in the nation.

The Clearinghouse hosted Dr. Hunter Fry, an Australian specialist, at a January luncheon. Local physicians and musicians had an opportunity to discuss his work and issues in the developing field of music medicine.

The Clearinghouse sponsored a program on "Special Problems of Instrumental Musicians" at the Medical and Chirurgical Faculty's Annual Meeting, with Richard Lederman MD, a neurologist from Cleveland, as the speaker. The Clearinghouse also maintained an exhibit.

The Clearinghouse is working cooperatively with the International Arts-Medicine Association to develop a system of arts medicine information

management. The Clearinghouse Coordinator serves on the IAMA's Information Management Committee. The Clearinghouse and the IAMA currently are exploring possible liaison activities between themselves and with a number of other interested organizations.

In June the Clearinghouse Coordinator visited the Miller Institute, a performing arts clinic in New York City. Their staff has benefitted from Clearinghouse products and have contributed new information to the collection. Other visits with similar institutions are planned.

In August the Coordinator will attend the Medical Problems of Musicians and Dancers Symposium in Colorado and the National Flute Association Annual Conference in New Orleans. The Coordinator serves on the NFA's Dysfunction Committee and will make a presentation during the Committee-sponsored workshop. The conference will feature an exhibit she developed on hand injuries.

The Clearinghouse has much to offer those interested in the field of music medicine. Musicians usually do not have access to a medical library and often are intimidated by the technical language. Physicians often do not have access to a music library. When they do venture into one, they can be frustrated by the relative lack of computerization and extensive indexing they have come to depend on in their own field. Allied health personnel often do not have a library geared specifically to their needs and hope for some relevant mateials in a medical, nursing, or academic library. Those interested in alternative, holistic therapies usually must do their own information analysis from many disparate sources. Even researchers who are very familiar with libraries can become discouraged going from one to another in trying to access a large number of specialized resources.

Clearinghouse services are making a positive impact. Reprints and bibliographies have been sent to countries as far away as Yugoslavia. Several physicians have called back to say how helpful the information received was in treating specific patients. Occupational therapists, music therapists, and a number of musicians have expressed their appreciation.

The Clearinghouse is fast becoming the primary source for information related to music medicine. Such information is often the key to the treatment of ailing musicians. It is also essential for developing prevention strategies as musicians, music teachers, and health professionals try to deal with potential problems before they occur.

SUSAN E. HARMAN, Coordinator
Music Medicine Clearinghouse

Our home care partnership puts it all together!

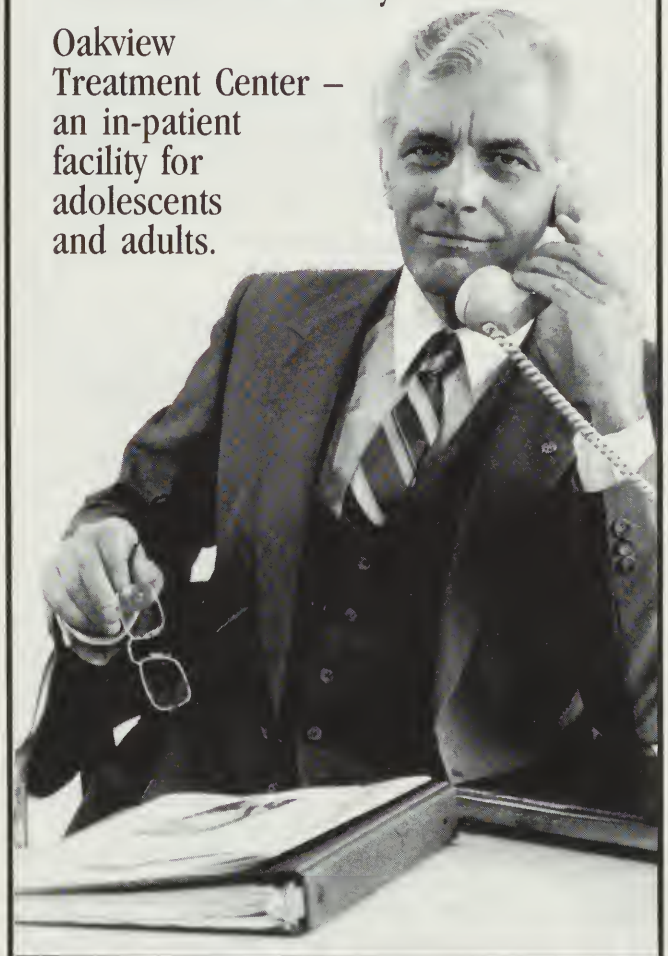
Physicians wanted for leading clinic

Prestigious Chicago-based clinic group specializing in the treatment of venous disorders is expanding nationally. Our newest clinic in Maryland is in need of physicians trained in internal medicine—or who have a broad base of medical experience. We will provide complete training in the latest proprietary techniques of treating venous disorders. We offer a six figure salary and bonus potential, along with malpractice insurance and health benefits. And since there are no weekend hours and a 40-hour work week, you will have plenty of leisure time. You won't have to worry about soliciting for patients or fighting insurance companies.

This is an outstanding opportunity for professional and financial advancement. If you are motivated to build a rewarding practice with the leader in the treatment of venous disorders, send your resume to:

Medical Director
Vein Clinics of America
2340 S. Arlington Heights Road
Arlington Heights, Illinois 60005



Referrals with many happy returns

If alcohol or other drug addiction is part of your patient's profile...let Oakview become part of your treatment team.

At Oakview we are committed to immediate and continuing recovery from addiction.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable.

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

Example of a Generic Screen Failure

Generic screens *are quality assurance critieria that are applied to every case under review. The purpose of each screen is to identify a potential adverse patient outcome.*

The case of a confirmed quality problem presented last month involved a 66-year-old woman who sustained "trauma suffered in the hospital" because of full thickness skin loss from tissue damage at an IV site. This was considered a possible quality-of-care problem, raised by a failure of "generic screen 6" on record review. What are screen failures? What is "generic screen 6?"

Health Care Financing Administration (HCFA) requires that all cases in which the charts show evidence of trauma suffered in the hospital be identified by the nurse reviewers. This is a "generic screen failure." (The term "generic" is used in the sense that this is a general class of events to be specifically reviewed.) If a quality of care problem is suspected, the case is referred to a physician advisor for evaluation. The physician advisor then has the responsibility to see whether the trauma was a result of poor care. "Generic screen 6" includes the following seven elements, or forms of trauma:

1. Unplanned surgery that includes, but is not limited to, removal or repair of a normal organ or body part (that is, surgery not addressed specifically in the operative consent)
2. Fall
3. Serious complications of anesthesia
4. Any transfusion error or serious transfusion
5. Hospital acquired decubitus ulcer and/or deterioration of an existing decubitus
6. Medication error or adverse drug reaction*
   a. with serious potential for harm
   b. resulting in special measures to correct
7. Care or lack of care in serious or potentially serious complications

Who Is Liable for Denied Care?

Each time an admission or continued stay is denied under Section 1862 of the Social Security Act, it is the responsibility of the PRO to determine if the hospital, the patient, or Medicare should be liable for payment. In most cases, Medicare already has paid the hospital. It is assumed the hospital will be liable for most denied days or denied admissions, as they have active utilization review and knowledge of medical necessity and the criteria of the Delmarva Foundation for Medical Care, Inc.

An exception exists if the hospital has notified the patient, in writing, that the admission or continued stay is not covered; in this case the patient will be liable. A second exception occurs when it is clear the hospital could not have known the care would be denied, in which case the PRO has the authority to waive the hospital's liability and allow for Medicare payment. Cases where the hospital could not have known the care would be denied are extremely rare; however, an example may be the case where a regulation changed to exclude payment for a certain procedure and the case was reviewed after the change date.

Use of the Physician Identification Number

During the past two years, the Foundation has discovered very frequent use of wrong physician identification numbers. This results in unnecessary paperwork for the physician; it also results in inappropriate data about patterns of care for a given physician. Sometimes these mistakes can be picked up at the time of actual chart review. However, when review is done on a sampling basis and findings compared to other data, a physician's practice pattern may be significantly distorted.

As medical review systems rely more and more heavily on data systems for patient identification, it becomes increasingly important that accurate physician identification numbers be used as a means of identifying those patients for whom each physician *actually* provides care.

The PRO urges all physicians and medical records and billing systems personnel to monitor closely the use of this important element in the medical data system.

PRO Update is contributed by the Publications Committee of the Delmarva Foundation for Medical Care, Inc. (Donald Harting MD, MPH, Chairman; Carol Lewis MPH, ScD; Jan Melhunak MHS) in cooperation with the Med Chi Peer Review Organization (PRO) Monitoring Committee, John Singer MD, Chairman. ■

Comments from physicians regarding the impact of these regulations on the quality of care delivered to patients are welcomed by the Editorial Board.

How Do You Tell Someone On Medicare She's An "Expenditure Target"?

Right now in Washington, a Congressional committee and the Bush Administration are toying with a new idea.

It's a system of explicit "expenditure targets" for the Medicare program.

The aim of this idea is to cut expenses. The result is that it will cut care.

What it amounts to is nothing less than an elaborate dis-incentive for treatment.

Instead of assuring access to vital health care services, this plan will accomplish the exact opposite. It will lead to the rationing of care.

The system calls for a national yearly target for spending on vital health care services. And after the target amounts are reached, the services would have to be reduced. This would be a disaster for older people.

Originally, Medicare was a golden promise that was made to all Americans.

We ask the Congress and the Bush Administration to keep the faith of that promise.

American Medical Association

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, PIE Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. PIE Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

Baltimore City Medical Society

BCMS Foundation, Inc., Awards

The Baltimore City Medical Society Foundation, Inc. presented $6,000 in scholarships for the 1989-90 academic year to five Baltimore City residents attending medical school. The awards are given out yearly from funds donated to the Foundation by Baltimore City physicians, their families, and friends. Any permanent resident of Baltimore City enrolled in a US medical or osteopathic school may apply for the scholarships, which are granted on the basis of academic achievement and financial need. Each applicant also must be endorsed by a member of the Baltimore City Medical Society (BCMS). Winners for the current year are Catherine McKesson, Saverio Mirarchi, Joseph W. Washington, Jeffrey A. Weaver, and Raymond B. Wynn.

Catherine McKesson was awarded the Elliott R. Fishel MD Memorial scholarship of $1,000. McKesson graduated *magna cum laude* from Towson State University in 1986 with a BS in Biology and Chemistry and a minor in Mathematics. A second-year medical student enrolled at the Medical College of Virginia, she is completing her second year of study at the University of St. Andrews, Scotland, in an exchange program. She will return to the Medical College of Virginia for her final two years and receive her degree there.

McKesson had received a Foundation award of $1,500 for the 1987-1988 academic year.

The scholarship is given in honor of Dr. Elliott R. Fishel each year by his family. Dr. Fishel was a native Baltimorean who served the community as a general surgeon for 35 years.

Saverio Mirarchi, a life-long resident of Baltimore City, was awarded the Nathan E. Needle MD Memorial Scholarship in the amount of $1,500 to support his medical training. Mirarchi graduated from The Johns Hopkins University with general honors in 1987 and was awarded a BA in Natural Science. He is a second-year medical student the University of Maryland Medical School.

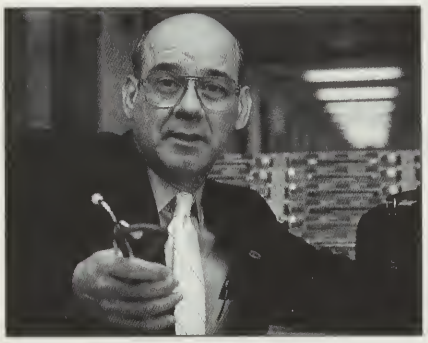
The memorial scholarship is given each year in honor of Dr. Nathan E. Needle, the first Treasurer of the Foundation, by his wife. Dr. Needle was a general practitioner in Baltimore City, retiring in 1978.

Joseph W. Washington, A Baltimore City resident, was awarded a $1,000 scholarship for the 1989-90 academic year. An inhabitant of Baltimore for 30 years, Washington graduated from Morgan State University in 1982 with a BS in Biology and a minor in Mathematics. He is a third-year student at Howard University and intends to become a cardiologist.

Jeffrey Weaver, a Howard University Medical School student, was awarded a $1,500 scholarship. Weaver is a second-year medical student. He graduated *cum laude* from the University of Maryland with a BA in Biology and is a lifelong resident of Baltimore City.

Raymond B. Wynn, a native of Baltimore City attending Meharry Medical College in Nashville, Tennessee, was awarded a $1,000 scholarship. Wynn graduated *cum laude* from Howard University in 1985 with a BS in Radiation Therapy Technology. He is a third-year medical student.

The Baltimore City Medical Society Foundation, Inc. was established in 1972 by the members of the Baltimore City Medical Society to support Baltimore City residents attending medical school and to fund philanthropic enterprises in the community. In addition to providing the scholarships, the Foundation contributed $1,000 to Health Care for the Homeless of Baltimore City to buy needed medical supplies and $500 to the Baltimore Commonwealth to support summer jobs in health care fields for City youth. ■



Baltimore County Medical Association

1988 Media Award

Ask the Doctor, the live call-in television show on Cable Channel 7, won the 1988 Media Award of the American Cancer Society. The award is given for the best cable programs regarding cancer education.

The two programs receiving the award were Cancer in Women, broadcast in January, and Cancer in Men, broadcast in February on Cable Channel 7. The "Ask the Doctor" program is produced by the Baltimore County Medical Association and is supported in a cooperative effort by Baltimore County General Hospital, Franklin Square Hospital Center, Greater Baltimore Medical Center, and St. Joseph Hospital.

This live call-in program is in its third year of production and can be seen on the first Wednesday of each month from 7:30 to 8:30 p.m. ■

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners *in* Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

One Minute With Diabetes

Eating Out

Doctor, I do fairly well following my diabetic meal plan at home, but when I go out to dinner it seems everything goes wrong. What can I do?

It is easier to follow any meal plan when eating at home, and the same dinner (including tax and gratuity) will cost about ten times as much when one eats in a restaurant. Since current custom is to eat out of the home more often, we must adjust to it. If a cafeteria is available one can make food selections easily; following a diabetic meal plan causes little or no difficulty there. However, one does not like to go to a cafeteria for a birthday or anniversary dinner, so we must learn "restaurant eating."

Before Eating Out

1. Know your meal plan so that you can make the best choices from available foods.
2. Know the restaurant. Is it an ethnic food place (Mexican, Chinese, etc.)? Do they provide a wide-choice menu? Are all the foods deep-fat fried? It is best to select a restaurant that provides a variety of choices of meats and vegetables.
3. It is preferable to eat within an hour of the same time each day. If reservations are required this can be managed easily. If reservations are not accepted, arrive early as there is almost never an hour waiting time. Carry some crackers or raisins in case you feel a reaction might be coming on. If there is a long delay, speak to the manager about your need for diabetic care. I have never known a restaurant that will not give priority for a medical problem.

Making Food Choices

Appetizers: *Choose* clear broth, bouillon, consommé, tomato juice, fruit juice, fresh vegetables, or seafood cocktail. *Avoid* cream soup, thick vegetable-meat or vegetable soup, sweetened juice or canned fruit, anything marinated in oil.
Breads: *Choose* plain bread or toast, pita, roll, biscuit, crackers, bread sticks, hotdog or hamburger bun, or english muffin. *Avoid* sweet roll, coffee cake, danish roll, doughnuts (plain, iced, or jelly).
Fats: *Choose* butter, margarine, salad dressing, mayonnaise, cream, sour cream, or cottage cheese. Ask for the fat to be placed on the side so that you can adjust the amount needed. *Avoid* gravy, fried foods, creamed foods, whipped cream.
Salads: *Choose* tossed salad, tomato, lettuce, sprouts, or cucumbers. Any low-calorie vegetable will be suitable. For dressing use lemon wedge, vinegar, or a low-calorie dressing.
Sandwich: *Choose* sandwich of meats, eggs, poultry, fish, cold cuts, or hot dog; may be toasted, open-face, or broiled. *Avoid* oversized sandwiches, gravies, or excessive mayonnaise.
Eggs: *Choose* poached, fried, scrambled, deviled, or omelet. *Avoid* creamed eggs; if you have hypercholesterolemia, restrict eggs as directed by your meal plan.
Meat: *Choose* serving size as recommended in your meal plan. It should be braised, baked, broiled, or roasted. Trim all fat from meats, remove skin from poultry. Meat juices are allowed. *Avoid* fatty, fried, and breaded food; food in barbecue sauce or thickened gravy.
Starchy Foods: *Choose* mashed, baked, or steamed potato; corn, rice, or pasta. Starchy foods often are served in large amounts; limit consumption to your meal plan portion. *Avoid* fried, french fried, creamed, au gratin, or escalloped potato; sweet potato.
Vegetables: *Choose* raw, stewed, steamed, stir fried, boiled, or baked vegetables prepared without added fat. *Avoid* creamed, escalloped, au gratin, candied, or with sauces.
Desserts: *Choose* fresh fruit, angel food cake, sponge cake, pound cake (all cake to be without icing); or ice cream (small scoop), if in your meal plan. *Avoid* pies, pastry, doughnuts, danish roll, sweetened fruit, canned fruit, sundaes, pudding, custard; almost everything on the dessert trolley.
Beverages: *Choose* iced tea, coffee, tea, diet soft drinks, tomato juice, milk, buttermilk, skimmed milk, or club soda. *Avoid* chocolate milk, cocoa, ice-cream soda, milk shakes, regular soft drinks, or any beverage with unknown ingredients.

If the menu does not describe how a food is prepared, do not hesitate to ask the waiter. If the waiter does not know, the information can be learned from the cook.

Condiments (mustard, catchup, horseradish, garlic, etc.) can be consumed in reasonable amounts without concern about caloric content.

A problem often encountered when eating out is that during the interval between placing the order and the arrival of the food, one tends to consume an excessive amount of bread and butter or cheese and crackers. It is a temptation difficult to resist.

If you are invited to eat at the home of a friend, ask what is being served and about what time the meal will be served. A good hostess often will allow you to make suggestions as to your likes and dislikes in foods.

Dining out should be enjoyable. Remember your meal plan, and do not overindulge.

1 Out Of Every 4 Medic Computer Systems Is Bought To Replace Another System.

Here's Why.

Too many practices find out about weak support too late. The smallest glitch takes hours of searching for help that never comes. The distributor went out of business. The software people say it's the hardware. And the hardware people don't answer the phone.

With Medic, that can't ever happen. Since we are the system developers, we can provide all the hardware and software expertise you'll need.

We start by assessing your practice's current needs and even the space you've got for computer stations. Then we follow through, with everything from helping you custom design your bills to seminars on getting the maximum benefit from your system.

That's the security Medic provides to more than 6,000 doctors in 2,000 practices from coast to coast. And it's backed by a $2.5 billion organization. Plus Texas Instruments hardware, with its excellent track record for reliability and expandability.

For a system you can start with and stay with, call Medic. Specialists in computer systems for America's medical community.

$1,000,000 Celebration

We are pleased to announce that **MED PAY** has funded $1 million in annualized physicians billing since January of this year.

This means no more insurance or collecting hassles for our new clients including:

- Psychiatrist
- Orthopedic Surgeon
- Physical Therapist
- Podiatrist
- Internist

We would be glad to schedule a free consultation to discuss how this timely billing and cash flow (Get paid today for patients seen yesterday and convert your present receivables to cash) program can be of benefit.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

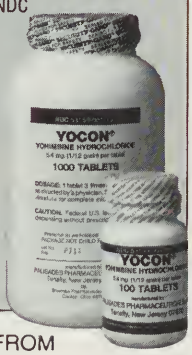
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

James P. G. Flynn MD

James P.G. Flynn MD has been named acting director of the Shock Trauma Center, University of Maryland Medical System, succeeding *R Adams Cowley MD*, founder of the unit, who has become director of the Mathias National Trauma Study Center, established by Congress in 1986. Dr. Flynn will continue in this position until a national search committee chooses Dr. Cowley's permanent successor. He hopes to go beyond the course established by Dr. Cowley and to interact with all phases of the University of Maryland Medical System.

Having served as CEO of Montebello Rehabilitation Hospital for eight years, Dr. Flynn was one of a team responsible for shifting the facility's focus from chronic care to rehabilitation, enabling Montebello to provide rehabilitation services for many Shock Trauma patients with spinal cord, brain, and other complicated injuries.

Dr. Flynn received his medical degree with distinction in Medicine from Trinity College, Dublin University. He trained at The Johns Hopkins Hospital, Baltimore City Hospitals, Greater Baltimore Medical Center, and the State of Maryland Department of Health and Mental Hygiene. He earned masters degrees from Tritnity College and the Johns Hopkins University School of Hygiene and Public Health.

■ ■ ■

Wayne B. Leadbetter, a practicing Orthopaedic Surgeon and Sports Medicine authority in Rockville, MD and suburban Washington, DC, was awarded an Asian Traveling Fellowship in Orthopaedic Sports Medicine. The Fellowship is sponsored by the American Orthopaedic Society for Sports Medicine, a prominent leadership organization in Orthopaedic Sports Medicine to which Dr. Leadbetter had been elected. Chosen for his contributions and accomplishments in the study of pathophysiology and treatment of sports-induced injury, Dr. Leadbetter was the invited lecturer of the Japanese and Hong Kong Sports Medicine Societies during July.

Dr. Leadbetter is a past-chariman of the Orthopaedic Surgery Department at Shady Grove Adventist Hospital and is Medical Director of the Shady Grove Center for Sports Medicine and Rehabilitation.

Maryland Academy of Family Physicians

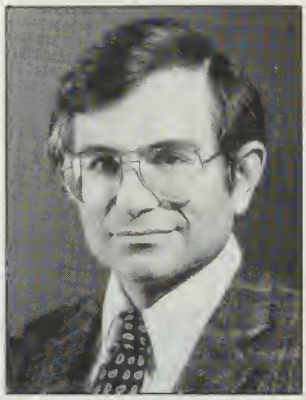
New officers of the Maryland Academy of Family Physicians were installed last May by Dr. James B. Jones, president of the American Academy of Family Physicians, during a ceremony at the Annual Banquet of the Maryland Academy at the Sheraton Ocean City Resort and Conference Center. The newly installed officers are: *Joseph W. Zebley*, III MD, president; *Lee E. Gresser MD*, president-elect; *Christine A. Marino MD*, treasurer; *Michael A. Moskewicz MD*, vice-president; *Anthony J. Bollino MD*, vice-president; and *Benito Martinez MD*, vice-president. Directors are *Kevin S. Ferentz MD, John B. Littleton MD, Christine L. Galan MD, Ben E. Oteyza MD, Abdul Nayeem MD, Richard Colgan MD, Robert Millman MD, and Francis C. Bruno MD. Dean H. Griffin MD* is delegate and *Rose Mary Hatem Bonsack MD* is alternate delegate to AAFP Congress.

■ ■ ■

The Maryland Thoracic Society

The Maryland Thoracic Society has elected its slate of officers effective March 1989-1991. Among them were *James P.G. Flynn MD*, immediate past-president; *C. Rodney Layton MD*, ATS representative councilor; and executive committee members *Floyd J. Malveaux MD* and *L. Dwight Wooster MD*.

The Maryland Radiological Society



The Maryland Radiological Society elected the following officers for the 1989-1991 term: *Christopher M. Harvey MD*, president; *Larry Holder MD*, president-elect; *Allan P. Weksberg MD*, secretary; *John D. Reeder MD*, treasurer; and *Harry C. Knipp MD*, councilor.

Dr. Harvey, a graduate of Temple University School of Medicine, Philadelphia, completed his diagnostic radiology residency at The Bryn Mawr Hospital, Bryn Mawr, Pennsylvania. He is vice-president and full partner, Radiology Associates, PA, with offices in Towson, Cockeysville, Dundalk, and Baltimore City. During his tenure as president of the Baltimore County Medical Association, Dr. Harvey developed and initiated Project Together, which provided free or reduced-fee medical and dental care to the unemployed in Baltimore County at a time when the county was hard hit by the shutdown and layoffs at Bethlehem Steel and at the shipyards. The program was carried out in cooperation with the Baltimore County Health Department.

Dr. Holder received his MD from Washington University, St. Louis, Missouri, and completed his residency as well as a Fellowship in nuclear medicine at the University of Cincinnati Hospital, Cincinnati, Ohio. A past-president of the Maryland Society of Nuclear Medicine, Dr. Holder is Chief, Department of Radiology at The Children's Hospital and Center for Reconstructive Surgery, and Director, Department of Nuclear Medicine, The Union Memorial Hospital, both in Baltimore. ■

Christopher M. Harvey MD

Larry Holder MD

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

October 16-21 — **Thirty-first Annual Emil Novak Memorial Course: Gynecology, Gynecological Pathology, Endocrinology, and High-Risk Obstetrics**. Fee: $650 physicians, $450 residents and fellows; 44.5 AMA Cat I credits, 44 ACOG cognates. Info: C. Kearney 301-955-2959.

October 18-20 — **Industrial Hygiene Air Sampling for Safety Professionals**. Fee: $550, course limited to 30 participants. Info: J. Corn 3011-955-2609.

October 28 - Nov 2 — **The Second Annual Written Boards in Emergency Medicine: A Comprehensive Review**, Sheraton Towson Conference Hotel, Baltimore, sponsored by the Johns Hopkins Medical Institutions Department of Emergency Medicine. Fee: before 9/1/89, $575 physicians, $550 residents; AMA Cat I credits and other appropriate credit pending.

December 7-9 — **Second Annual Wilmer Institute Current Concepts in Ophthalmology**. Fee: $250, $200 (those in training); 20 AMA Cat I credits. Info: D. Heydinger 301-955-2959.

Ophthalmic Electrophysiology Technician Training Course (on-going 1-week course by appointment). The Wilmer Eye Institute, Baltimore. Info: C. Kearney.

The Department of Radiology and Radiological Sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams 301-955-3169.

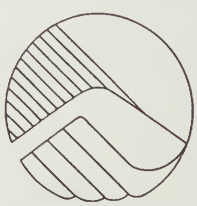
Basic Practicum in Diagnostic Ultrasound: Nov 6-10. Fee: $500; 40 AMA Cat I credits.

Advanced Practicum in Diagnostic Ultrasound: Dec 4-8. Fee: $500; 40 AMA Cat I credits.

Visiting Physicians - offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. Fee: $500; 40 AMA Cat I credits.

Johns Hopkins Medical Grand Rounds - Accredited audiovisual continuing education series of case discussion for clinicians; 30 topics/year in 5 bimonthly programs. Individual and group subscriptions; 40 AMA Cat I credits. Info: 301-955-3988.

Microsurgery Training at The Johns Hopkins Hospital, one week, offered continuously throughout the year. 40 AMA Cat I credits. Info: P. Williams 301-955-3169. ■



Medicine is about helping each other, as well as our patients...

"It is a physician's ethical responsibility to take cognizance of a colleague's inability to practice medicine by reason of physical or mental illness, including alcoholism or drug dependence... Accountability to the public through assurance of competent care to patients by physicians and other health professionals is a paramount responsibility of organized medicine."

from "The Sick Physician", a report to the Council on Mental Health adopted by the AMA House of Delegates, November 1972.

In moderate depression and anxiety

- 74% of patients experienced improved sleep after the first *h.s.* dose[1]
- First-week improvement in somatic symptoms[1]
- 50% greater improvement with Limbitrol in the first week than with amitriptyline alone[2]

Protect Your Prescribing Decision: Specify "Do not substitute."

Limbitrol®

Each tablet contains 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt) Ⓒ

Limbitrol® DS

Each tablet contains 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt) Ⓒ

References: 1. Data on file, Hoffmann-La Roche Inc., Nutley, NJ. 2. Feighner VP, *et al: Psychopharmacology 61:*217-225, Mar 22, 1979.

Limbitrol®Ⓒ
Tranquilizer—Antidepressant
Before prescribing, please consult complete product information, a summary of which follows:
Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants; concomitant use with MAOIs or within 14 days of monoamine oxidase inhibitors (then initiate cautiously, gradually increasing dosage until optimal response is achieved); during acute recovery phase following myocardial infarction.
Warnings: Use with caution in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur when used with anticholinergics. Closely supervise cardiovascular patients. Arrhythmias, sinus tachycardia, prolongation of conduction time, myocardial infarction and stroke reported with tricyclic antidepressants, especially in high doses. Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (*e.g.,* operating machinery, driving).
***Usage in Pregnancy:* Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations. Consider possibility of pregnancy when instituting therapy.**
Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).
Precautions: Use cautiously in patients with a history of seizures, in hyperthyroid patients, those on thyroid medication, patients with impaired renal or hepatic function. Because of suicidal ideation in depressed patients, do not permit easy access to large quantities of drug. Periodic liver function tests and blood counts recommended during prolonged treatment. Amitriptyline may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady-state concentrations of the tricyclic drugs. Use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Should not be taken during the nursing period or by children under 12. In elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.
Adverse Reactions: Most frequent: drowsiness, dry mouth, constipation, blurred vision, dizziness, bloating. Less frequent: vivid dreams, impotence, tremor, confusion, nasal congestion. Rare: granulocytopenia, jaundice, hepatic dysfunction. Others: many symptoms associated with depression including anorexia, fatigue, weakness, restlessness, lethargy.
Adverse reactions not reported with Limbitrol but reported with one or both components or closely related drugs: *Cardiovascular:* Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke. *Psychiatric:* Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania, increased or decreased libido. *Neurologic:* Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns. *Anticholinergic:* Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract. *Allergic:* Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus. *Hematologic:* Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia. *Gastrointestinal:* Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue. *Endocrine:* Testicular swelling, gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion. *Other:* Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.
Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. Withdrawal symptoms also reported with abrupt amitriptyline discontinuation. Therefore, after extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.
Overdosage: Immediately hospitalize patient. Treat symptomatically and supportively. I.V. administration of 1 to 3 mg physostigmine salicylate may reverse symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.
How Supplied: *Double strength (DS) Tablets,* white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and *Tablets,* blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 50.

ROCHE
ROCHE PRODUCTS INC.
Manati, Puerto Rico 00701

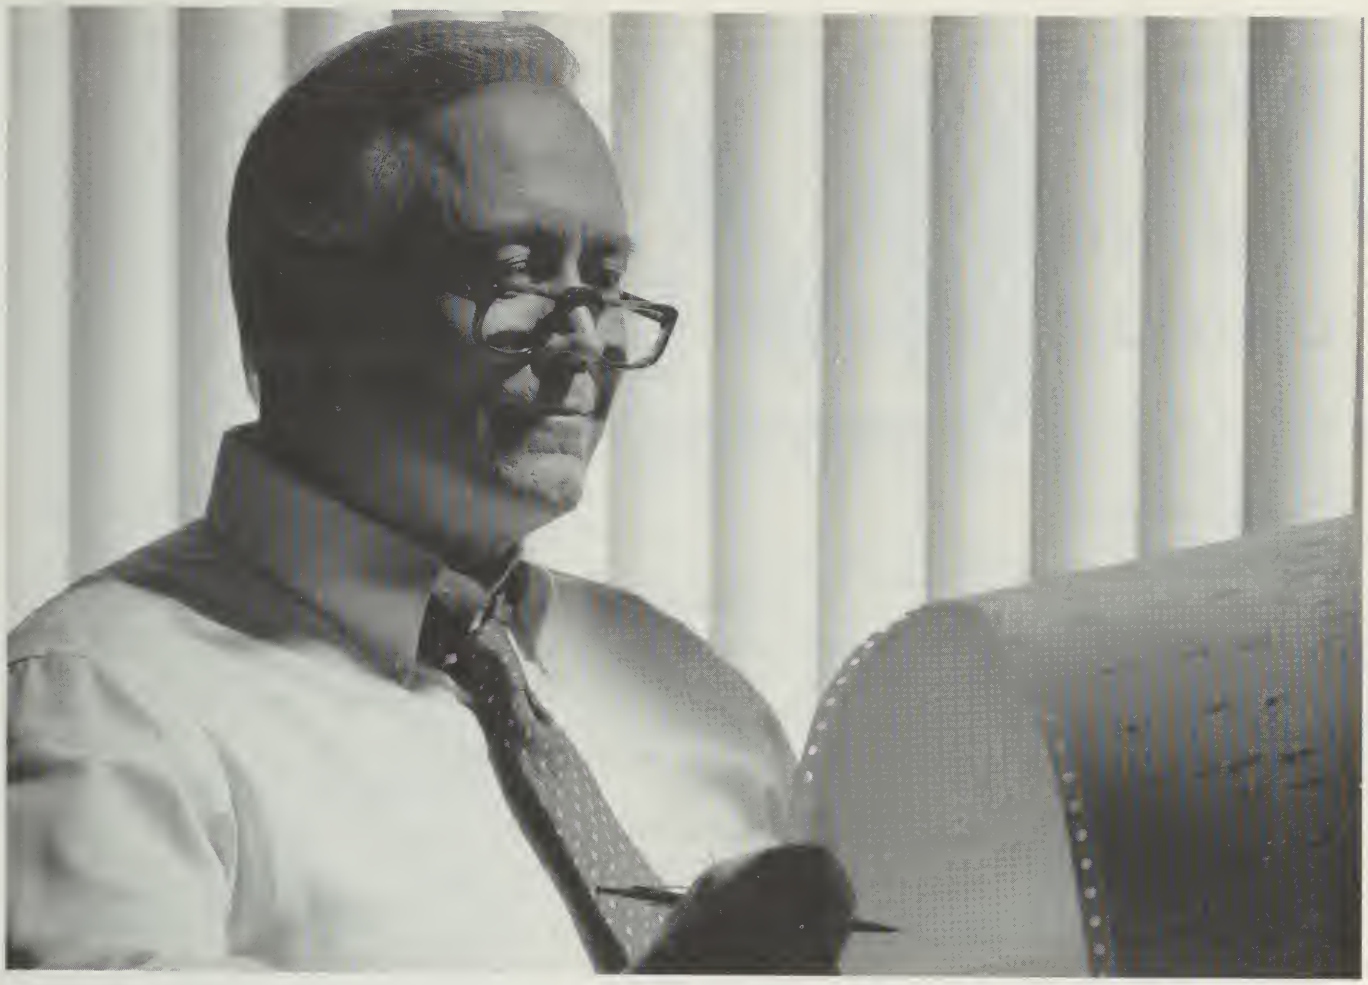
Maryland. Tried & True.

It's true. In today's rapidly changing health care environment, your professional liability insurance must be strong, stable, and reliable. You shouldn't have to worry about whether your company will still be here to protect you in the future.

For more than a decade, thousands of Maryland physicians have found the protection they need with Medical Mutual Liability Insurance Society of Maryland. A financially sound, conservatively managed specialty insurer, Medical Mutual is recognized as expert in the area of professional liability insurance.



Backed by a professional staff with years of experience in underwriting, claims handling, and risk management, our professional liability insurance provides strong, reliable protection—plus the expertise, service and attention that only a specialty insurer can offer.

We are proud to be serving thousands of your colleagues already, Maryland physicians who have found the right combination of protection, flexibility, and service for their practices. If you haven't met us yet, call your broker or call our Member Services Department at 1-800-492-0193.

Medical Mutual. Try us and see what we can do for you.

Three financial reasons why practices choose the ACCLAIM™ Medical System

There are many compelling reasons to automate with the ACCLAIM Medical System. Here are three important benefits our customers have taken the time to write to us about:

1 Improved Cash Flow

"We have seen dramatic improvements in the efficiency of filing insurance claims and tracking accounts. We've also seen substantial improvement in our accounts receivable."

Susan Shaffer, Office Manager
Single Physician Practice

2 Increased Productivity

"The system is easy to use, straightforward in its commands and simplifies medical office management beyond belief."

Judy Greenburg, Office Manager
Four Physician Practice

3 Financial Control

"Sentient's ACCLAIM system has improved our collections by 100% and has provided reliable data on which to base practice management decisions."

Frank J. Mayo, M.D., Pulmonologist

Sentient Systems offers total solutions. Hardware (IBM® and compatible), software, installation, data conversion, training, support and service are a part of every system. We provide the highest quality medical system available today. Just ask our customers.

THE MEDICAL COMPUTING LEADER

A Choice.

Just what the doctors ordered.

Now that you have a choice of professional liability insurers, how do you compare your options? Consider these important points:

- **The protection you get from your policy**

Princeton's exclusive *Occurrence Plus* policy gives you comprehensive protection - including "tail" coverage - that's complete when purchased. With some other policies on the market, you might wait years before receiving such coverage.

- **The company's experience in medical malpractice claims management**

Princeton is known for providing a strong defense against meritless claims, and that helps protect your professional reputation. Our exceptional claims management record reflects our years of experience in resolving medical malpractice cases.

- **The company's financial strength and stability**

With its parent organization, Princeton Insurance Company ranks as the nation's 10th largest professional liability carrier for medical professionals. And Princeton has one of the lowest loss ratios among the top 10.

To learn more about how Princeton compares, contact one of the independent insurance agents that represent Princeton.

OCTOBER 1989 VOLUME 38 NO 10

ARTICLES

Maryland and International Health 797
Timothy D. Baker MD, MPH
Maryland physicians involved in international work in developing countries feel a moral commitment to help the truly destitute of the world.

Yellow Fever and Maryland Physicians 801
Timothy D. Baker MD, MPH
Tenacity, human-relations and scientific skills, and ability to recognize important scientific advances and implement them are human elements essential to the success of disease control programs.

D.A. Henderson: Bringing the Lessons of Smallpox Home 805
Winthrop Morgan MPH
In October 1977, Dr. D. A. Henderson provided irrefutable proof that we have the power to conquer infectious diseases through cooperation, coordination, and common sense. Smallpox was dead.

Malaria in Maryland since 1960: Incidence and Research 809
David F. Clyde MD, PhD
Immediately prior to US involvement in Vietnam, less than 3 cases of malaria were reported from Maryland each year, in contrast to current identification of 10 times that number.

Typhus, Typhoid, and T.E.W. 813
William E. Woodward MD
Theodore E. Woodward's initial discovery of the cure of typhoid may have been serendipitous, but it started his formal study of typhoid fever, which has continued to the present.

International Nutrition Research by a Maryland Physician 817
Chris Kjolhede MD, MPH
A major international nutrition project has lasted for almost three decades, primarily through the efforts of one Maryland scientist-pediatrician.

Statistics and Soap Operas: Population Dynamics at Hopkins 821
Winthrop Morgan MPH
The Population Dynamics Department at The Johns Hopkins School of Hygiene an Department has given new meaning to interdisciplinary collaboration.

Battling Blindness Throughout the World: A Team of Scientists in Maryland Leads the Way 825
Jean H. Humphrey RD, MSPH and Alfred Sommer MD, MHSc
An interdisciplinary team is combating the worldwide scourge of preventable blindness through clinical, epidemiologic and laboratory research, training, and action programs.

Medical
and Chirurgical Faculty
of Maryland

Reverse Foreign Aid : The Foreign Medical Graduate 829
Timothy D. Baker MD
Maryland has received a great gift of dedicated hard-working FMGs whose basic education was underwritten by other countries.

Geographic Epidemiology 833
Alfred A. Buck MD
Information on health problems of people in rural areas of developing countries is scarce; national health statistics are limited due to a lack of adequate diagnostic facilities and incomplete disease reporting. Generalizations from isolated observations to larger areas are fallacious because they neglect the focal nature of most endemic diseases.

Health Care of Merchant Seamen 839
John B. MacGibbon MD
The Port of Baltimore has almost 3,000 ship arrivals every year from over 50 countries. Almost 70,000 merchant seamen from throughout the world enter the port.

Maryland's Travelers' Clinics 846
R.B. Sack MD, D. Herrington MD, and T. Baker MD
Almost half a million Marylanders travel outside the United States every year and are subjected to disease and injury hazards not generally encountered in this country.

American Practitioners and the Global Primary Care Movement. . 849
Henry G. Taylor MD and Carl E. Taylor MD
Experimental Community-Oriented Primary Care (COPC) demonstrations are beginning to show how innovative concepts from around the world can help evolve a distinctly American health system adapted to the particular needs of each community.

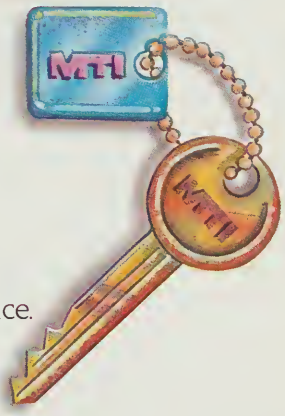
Performance . . . Reliability . . . Comfort . . . Value



For the same reasons more than 6,000 physicians nationwide have selected the Medical Manager® to automate their offices.

Performance	easy-to-use, adaptable to your needs, multi-user, multi-tasking
Reliability	upgraded annually, supported locally and nationwide, endorsed by more Medical Societies than any other system
Comfort	customized to your needs, supported by Prism's staff of experienced medical office administrators
Value	An installed base of 6,000 systems, growing at a rate of 150 installations per month, allows us to make a superior system available at a competitive price.

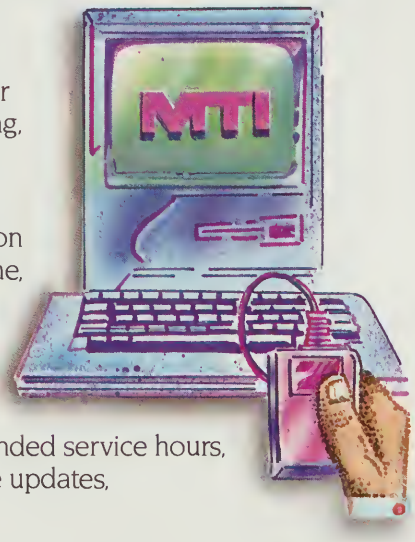
Manage your practice in ten-part HARMONY...

1 **Comprehensive Solutions:** MTI's HARMONY integrates every business office function...data and word processing, claims submission, patient records, appointments scheduling, accounts management...into a comprehensive, turn-key practice management system.



2 **Customized Solutions:** Hardware, software, installation, training, AFTERCARE support, supplies...all custom-tailored to your individual practice.

3 **Unlimited Training:** For your current *and* future staff, for the life of your system.

4 **Over 1000 Doctors:** MTI's systems are meeting the practice management needs of hundreds of physicians...in every specialty, all across the country.

5 **Compatibility:** We offer a free evaluation of your system and practice and help you determine lowest-cost options for upgrades...and MTI's systems are compatible with IBM, Wang, DEC, **TEXAS INSTRUMENTS** and other major manufacturers.

6 **Conversion:** MTI specialists will transfer all practice data on your current system to the HARMONY system. No downtime, no overtime, no anxiety.

7 **Aftercare:** A phone call away, MTI technicians keep your system up and running...with vigilant support, extended service hours, guaranteed response time and repairs, software updates, and custom-programming options.

8 **Money-Back Guarantee:** Something rare among practice management vendors...a money-back guarantee! If HARMONY doesn't meet performance specifications, we'll refund your money.

9 **Non-Obsolescence Guarantee:** Every component offered by MTI is state-of-the-art and will stay that way... supplemented by ongoing system research, programming and enhancements offered to all clients on software maintenance.

10 **Price:** Best of all, HARMONY is competitively-priced *and* cost-effective. Call MTI at 800-777-7MTI.

OCTOBER 1989
Recommendations for Influenza Prevention

Although the cool December weather seems a distant thought, it is time now to plan influenza vaccinations for the coming season. During the last influenza season Maryland experienced widespread activity in the general public while seeing a decrease in institutional outbreaks over the 1987-1988 season. This article a) summarizes reported influenza during the 1988-1989 season, b) provides general information on the prevention and control of influenza, and c) includes a copy of the Important Information About Influenza and Influenza Vaccine, 1989-1990 (consent form) for use with the 1989-1990 influenza vaccine.

1988-1989 INFLUENZA SEASON

The 1988-1989 influenza season extended from December 1988 through April 1989. The Maryland Department of Health and Mental Hygiene (DHMH) Center for Clinical Epidemiology has conducted surveillance through: a) outbreak investigation, b) physician morbidity reports, c) school absenteeism reports to the local health departments, and d) review of laboratory isolates received by the DHMH Central Laboratory along with isolates submitted by private laboratories.

Thirty-two outbreaks of respiratory illness involving 824 cases were reported to the Division of Outbreak Investigation during this period. Facilities which reported outbreaks included 26 nursing homes, five state institutions, and one day care center. Seven of these outbreaks were laboratory-confirmed as due to influenza B (B/Victoria/2/87). One outbreak of influenza A was identified. No agent was identified in the 24 remaining outbreaks. Maryland physicians reported 579 cases with reports peaking in February and March. Excess (greater than 10%) absenteeism was reported by 19 of the 23 counties as well as by Baltimore City. There were 74 laboratory isolates of influenza virus consisting of 30 influenza A and 44 influenza B. Twenty- seven of the 30 influenza A were identified as A/Taiwan/2/86-like (H1N1), a component of the 1988-1989 influenza vaccine. Forty- three of the 44 influenza B isolates were identified as B/Victoria/2/87, also a component of the current vaccine. The four remaining isolates (3 influenza A, 1 influenza B) were either not subtyped or have been sent to the CDC for subtyping with results still pending.

PREVENTION AND CONTROL OF INFLUENZA

The U.S. Public Health Service, Immunization Practices Advisory Committee (ACIP), has published recommendations for the prevention and control of influenza for the 1989-1990 season (MMWR 1989; 38: 297-298, 303-311). That article deals with the use of the 1989-1990 influenza vaccine. Information on use of amantadine should be published in the

MMWR before the start of the 1989-1990 season. Immunoprophylaxis with inactivated (killed-virus) vaccine and chemoprophylaxis or therapy with an influenza-specific antiviral drug (e.g. amantadine) are the two measures available in the U.S. to reduce the impact of influenza. Of these, vaccinations of high-risk persons each year before influenza season is the most important method for prevention of both influenza A and B. Chemoprophylaxis or therapy with amantadine is effective only for influenza A. Vaccination can be highly cost-effective 1) when it is aimed at persons at high-risk for influenza complications or at higher-than-average risk for exposure and 2) when it is administered during a hospitalization or routine health care visit, thus making a special visit to a health care provider unnecessary.

Although yearly vaccination is the best means for influenza prevention, less than 30 % of persons in high-risk groups in the U.S. have received the vaccine each year. Increased use of the vaccine, especially in the elderly and other high-risk groups, could prevent many influenza-associated hospitalizations and deaths. Ten thousand or more excess deaths have been documented in each of 19 epidemics during 1957-1986; more than 40,000 excess deaths occurred in each of several recent epidemics.

TIMING OF VACCINE: The development of a protective response following vaccination takes about 2 weeks. Programs for administration of the 1989-1990 vaccine to high-risk persons should begin prior to the usual December start of the influenza season.

VACCINE COMPOSITION & DOSAGE: The 1989-1990 trivalent influenza vaccine contains a new group of antigens. Remaining 1988-1989 vaccine should not be used. See Table 1, below, for vaccine dosage recommendations, sources, and specific antigen content.

The Important Information sheet which follows contains important facts for you and your patients about who should or should not be vaccinated, dosage, and side effects. It also provides a convenient informed consent record. Even more detailed information appears in the MMWR article cited above.

TABLE 1. Influenza vaccine* dosage, by patient age — United States, 1989–90 season

Age group	Product†	Dosage	No. doses	Route§
6–35 mos	Split virus only	0.25 mL	1 or 2¶	IM
3–12 yrs	Split virus only	0.50 mL	1 or 2¶	IM
>12 yrs	Whole or split virus	0.50 mL	1	IM

*Contains 15 μg each of A/Taiwan/1/86-like (H1N1), A/Shanghai/11/87-like (H3N2), and B/Yamagata/16/88-like hemagglutinin antigens in each 0.5 mL. Manufacturers include: Connaught Laboratories, Inc. (distributed by E.R. Squibb & Sons Inc.) (Fluzone® whole or split); Parke-Davis (Fluogen® split); and Wyeth-Ayerst Laboratories (Influenza Virus Vaccine, Trivalent® split). For further product information call Connaught, (800) 822-2463; Parke-Davis, (800) 223-0432; Wyeth-Ayerst, (800) 321-2304. A fourth vaccine, manufactured by Evans Medical Ltd. and distributed by Lederle Laboratories (purified surface antigen vaccine), may be available for the the 1989-90 influenza season. Further information can be obtained from Lederle Laboratories, telephone [800] 533-3753.

†Because of the lower potential for causing febrile reactions, only split-virus vaccines should be used in children ("split virus" refers to viruses that have been chemically treated to reduce the level of potentially pyrogenic components). They may be labeled as "split," "subvirion," or "purified surface antigen" vaccine. Immunogenicity and side effects of split- and whole-virus vaccines are similar in adults when vaccines are used according to the recommended dosage.

§The recommended site of vaccination is the deltoid muscle for adults and older children. The preferred site for infants and young children is the anterolateral aspect of the thigh.

¶Two doses are recommended for children ≤12 years old who are receiving influenza vaccine for the first time.

IMPORTANT INFORMATION ABOUT INFLUENZA AND INFLUENZA VACCINE, 1989 - 1990

PLEASE READ THIS CAREFULLY

WHAT IS INFLUENZA ("FLU")? Influenza (or "flu") is a viral infection of the nose, throat, bronchial tubes, and lungs that can make someone of any age ill. Usually the flu occurs in the United States from about November to April. If you get the flu, you usually have fever, chills, cough, and soreness and aching in your back, arms, and legs. Although most people are ill for only a few days, some persons have a much more serious illness and may need to go to the hospital. On average, thousands of people die eash year in the United States from the flu or related complications.

WHO SHOULD GET INFLUENZA VACCINE? Because influenza is usually not life threatening in healthy individuals and most people recover fully, health officals emphasize the use of vaccine for the elderly and people with other health problems which make these individuals more likely to be seriously ill or to die from the flu or its complications. For example, people who after even light exercise become short of breath due to diseases affecting their heart or lungs, and people who have low resistance to infections, are likely to be more seriously affected by the flu. Thus, the following groups are at increased risk for serious illness with the flu and should receive vaccine:

- Adults and children with long-term heart or lung problems which caused them to see a doctor regularly, or to be admitted to a hospital for care during the past year.
- Residents of nursing homes, and other institutions housing patients of any age who have serious long-term health problems.
- Healthy people over 65 years of age.
- People of any age who during the past year have regularly seen a doctor or have been admitted to a hospital for treatment for kidney disease, cystic fibrosis, diabetes, anemia ("low blood"), or severe asthma.
- People who have a type of cancer or immunological disorder (or use certain types of medicines) that lowers the body's normal resistance to infections. (Because influenza might cause serious illness and complications in persons infected with the AIDS virus, these individuals should receive influenza vaccine.)
- Children and teenagers (6 months through 18 years of age) on long-term treatment with aspirin who, if they catch the flu, may be at risk of getting Reye syndrome (a childhood disease that causes coma, liver damage, and death).

(PLEASE READ OTHER SIDE)

Certain medical staff who provide care to high-risk patients in health-care facilities should be vaccinated, to reduce the possibility that these patients might catch the flu when receiving medical care. Family members or others who provide care to high-risk persons at home should also be vaccinated. The possibility for spreading the flu to high-risk persons can be reduced by vaccinating:

- Doctors, nurses, and others in both hospital and outpatient-care settings who have extensive contact with high-risk patients in all age groups, including children.
- Individuals who provide care to high-risk persons at home, such as visiting nurses and volunteers, as well as all household members, including children, whether or not they are providers of care.

In addition, a flu shot may be given to:

- Persons wishing to reduce their chances of catching the flu.
- Persons who provide essential community services.
- Students or other persons in schools and colleges if outbreaks would cause major disruptions of school activities.
- Persons traveling to the tropics at any time of the year or to countries south of the equator during April-September. (Persons with high-risk medical conditions and those ages 65 and older who are traveling as indicated above especially should be encouraged to receive vaccine.)

INFLUENZA VACCINE: The viruses that cause flu frequently change, so people who have been infected or given a flu shot in previous years may become infected with a new strain. Because of this, and because any immunity produced by the flu shot will possibly decrease in the year after vaccination, persons in the high-risk groups listed above should be vaccinated every year. This year's flu shot contains the strains A/Taiwan/1/86, A/Shanghai/11/87, and B/Yamagata/16/88 to provide immunity against the types of flu which have been circulating in the past year, and/or are thought to be most likely to occur in the United States next winter. All the viruses in the vaccine are killed so that they cannot infect anyone. Vaccine will begin to provide its protective effect after about one or two weeks, and immunity may decrease, on average, after several months. Flu shots will not protect all persons who get them against the flu. They also will not protect against other illnesses that resemble the flu.

DOSAGE: Only a single flu shot is needed each season for persons older than 12 years, but children 12 years or less may need a second shot after about a month. The doctor or nurse giving the flu shot will discuss this with parents or guardians. Children should be given only vaccine that has been chemically treated during manufacture (split virus) to reduce chances of any side effects. Split-virus vaccines can also be used by adults.

POSSIBLE SIDE EFFECTS FROM THE VACCINE: Most people have no side effects from recent influenza vaccines. Flu shots are given by injection, usually into a muscle of the upper arm. This may cause soreness for a day or two at the injection site and occassionally may also cause a fever or achiness for one or two days. Unlike 1976 swine flu vaccine, recent flu shots have not been linked to the paralytic illness Guillain Barre syndrome. As is the case with most drugs or vaccines, there is a possibility that allergic or more serious reactions, or even death, could occur with the flu shot.

WARNING-SOME PEOPLE SHOULD CHECK WITH A DOCTOR BEFORE TAKING INFLUENZA VACCINE:

- Persons who should not be given the flu shot include those with an allergy to eggs that causes dangerous reactions if they eat eggs.
- Anyone who has ever been paralyzed with Guillain Barre syndrome should seek advice from their doctor about special risks that might exist in their cases.
- Women who are or might be pregnant should consult with their doctor.
- Persons who are ill and have a fever should delay vaccination until the fever and other temporary symptoms have gone.

QUESTIONS: If you have any questions about influenza or influenza vaccination, please ask now or call your doctor before requesting the vaccine.

REACTIONS: If anyone receiving influenza vaccine gets sick and visits a doctor, hospital, or clinic in the 4-weeks after vaccination, please report this to:

PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

Influenza 7/1/89

I have read or have had explained to me the information on this form about influenza and influenza vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of influenza vaccine and request that the vaccine be given to me or to the person named below for whom I am authorized to make this request.

Eight physicians and four medical office managers tell "all" about automation.

"Before we automated, our cash flow would stop for a month at a time. Now there's a more regular cash flow."

"We didn't add or subtract people. We just get more work done in the same amount of time."

"Now it takes just one hour to bill 3,000 accounts."

"If a patient didn't show up, I never knew it. Now, we can contact those who miss their appointments."

What can automation do for you?... What can't it do?... Is it practical?... What should you look for in a system?... What should you expect from the company who sells you the system?... How will it affect your staff?... And how do you go about getting the answers to all these questions?

KTI can help. As the systems supplier to over 3,000 healthcare professionals, we brought together a group of physicians and medical office managers to talk about the benefits and cautions of automation. And prepared a special report on their thoughts and comments.

If you want the advantage of their experiences, send us this coupon. And you'll get a lot of answers in just a few minutes of reading.

LEGAL AND ETHICAL CONCERNS OF YOUR MEDICAL PRACTICE

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIV, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

■ ■ ■

Release of Information

At its June 29, 1989 meeting, the Council adopted the following revised ethical opinion on "Release of Information":

Except as provided by law or as authorized by the patient, a physician should not release medical information about a patient to any person.

Physicians are reminded that, under Maryland law (Section 4-301 (b) of the Health-General Article of the Code), "any provider of medical care who has custody of medical records may not reveal specific medical information contained in those records to any person unless authorized by the individual on whom the record is kept." There are currently 11 limited circumstances under which this prohibition against disclosure without patient authorization applies. If you are releasing information without patient authorization, be sure that one of the following applies:

Medical information may be released if the provider of care is:

1. Performing medical services or allied support services for or on behalf of a patient.
2. Providing information requested by or to further the purpose of a medical review committee, accreditation board or commission, or in response to legal process.
3. Providing information required to conduct the proper activities of the health care provider.
4. Providing information to a government agency performing its lawful duties as authorized by an act of the Maryland General Assembly or the United States Congress.
5. Providing information at the request of a researcher for medical and health care research under a protocol approved by an institutional review board.
6. Revealing the contents of medical records under circumstances where the identity of the patient is not disclosed to the recipient of the records.
7. Providing information to an insurance company or to a defendant or the defendant's legal counsel, in connection with a potential or actual malpractice claim against a provider of medical care.
8. Providing information requested by another provider of medical care for the sole purpose of treating the individual on whom the record is kept.
9. Providing information to a third-party payor for billing purposes only.
10. Providing information to a nonprofit health service plan or a Blue Cross or Blue Shield plan to coordinate benefit payments under more than one sickness and accident, dental, or hospital and medical insurance policy other than an individual policy.
11. Providing information to organ and tissue procurement personnel under the restrictions of Section 5-408 of this Article at the request of a physician for a patient whose organs and tissues may be donated for the purpose of evaluating the patient for possible organ and tissue donation.

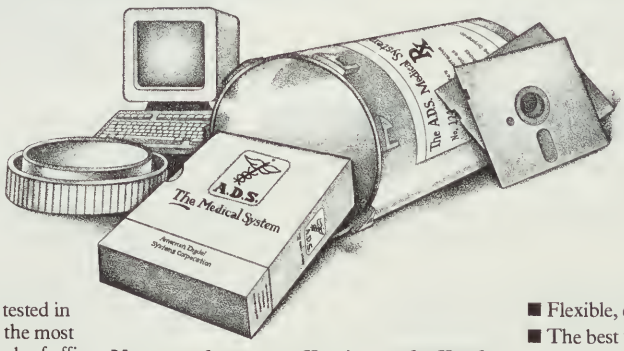
At the same Council meeting, the Committee on Professional Ethics was requested to specifically address, in the context of the revised ethical opinion on "Release of Information," the handling of telephone requests for release of medical information from utilization review agents of insurance companies. Additional clarification from the Committee on Professional Ethics is pending.

Ethical Opinion on Dissolution of Medical Practice; Termination of Physician Employee

The following Ethical Opinion on Dissolution of Medical Practice, Termination of Physician Employee was adopted by Council on February 12 1987:

DISSOLUTION OF MEDICAL PRACTICE; TERMINATION OF PHYSICIAN EMPLOYEE

When physicians dissolve a professional corporation or partnership, or when a physician group discharges a physician employee, the patient's best interest must be paramount, regardless of the dispute that may arise in such situations.



The notice of the change in providers should be a simple factual statement, provided to patients in a timely manner. It should indicate the date of the dissolution or discharge, the address, and telephone number of the physician(s) who will be available for continued patient care. If the departing physician(s) is (are) continuing practice, the address and telephone number of the departing physician(s), when known, should be made available to patients for continued care.

Appropriate instructions should be given to the office staff concerning the handling of patients' questions. Disputes concerning medical records should be resolved according to Ethical Opinion 104,* Medical Records. All physicians involved should act in a fair and professional manner. The patient must always have free choice of physician unless the patient has limited this right by contract with an alternative delivery system. (Council; 2/12/87)

The Committee on Professional Ethics has been requested by several physicians to clarify the ethical opinion on "Dissolution of Medical Practice; Termination of Physician Employee." Questions have arisen as to whether the remaining physician in a practice in which a physician employee has been terminated or in which the practice relationship has been terminated has an ethical responsibility to send written notices to patients of the departing physician or to provide patient lists to the departing physician. No such requirements of providing written notices to patients or patients lists are meant to be imposed under this ethical opinion. The focus of the opinion is to provide guidelines for physicians to ensure that the best interests of the patient are served and to preserve the right of the patient to freely choose the his\her physician. ■

For daily office headaches, take what doctors recommend.

The A.D.S. Medical System. It's been tested in medical offices for years and found to be the most effective and affordable remedy for all kinds of office headaches.

You know the headaches.

Mountains of paperwork. Appointment scheduling. Insurance forms and claim submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Now try the most effective and affordable cure.

The A.D.S. Medical System is a proven high performance, easy-to-use system that offers the features you need to fully automate your practice.

- Shortest training period of any system
- Top quality hardware/software service support
- Flexible, expandable multi-user reliability
- The best value available

Call for more information or a free demonstration.

Once you've examined our system, you'll find it's the best available cure for the headaches of managing and operating your practice.

The A.D.S. Medical System. It can make a practice perfect.

Malpractice-Insurance Company Injunction

In June 1989, the Indiana Department of Insurance obtained an injunction against the Medical Liability Purchasing Group, Inc. of Indiana. This insurance group solicited physicians by mail to purchase malpractice insurance from an offshore company that had not been admitted to do business in any state.

A copy of the *Findings of Fact and Conclusions of Law* from the US District Court in Indiana is available on request from Med Chi (1-800-492-1056 or in Baltimore, 301-539-0872). Physicians are urged to be careful in selecting a malpractice insurance company.

ICD-9 Coding Requirement Extended

HCFA has agreed to extend the grace period for the new regulations requiring ICD-9 codes on all Medicare Part B claims until October 1, 1989. All claims with date-of-service October 1, 1989 or later submitted without a diagnostic code should be denied. Failure of physicians to comply with the requirement could result in monetary penalties of up to $2,000 per incident, or exclusion from the Medicare program. This decision means that, at the AMA's request, HCFA has provided six months of a grace period (April 1 to October 1) for "improperly" coded diagnoses. Also at AMA's request, HCFA has instructed its carriers not to deny claims for "improperly" coded diagnosis until at least January 1, 1990. This means that physicians will have an additional three months to become more familiar with the specifics of the coding guidelines.

To assist physicians in finding an appropriate diagnosis code, the AMA intends to publish abstracted sets of the ICD diagnostic codes based on specialty groupings as part of the CPT 1990 minibook series. The AMA has a limited number of ICD-9 codebooks available for $38.40, which may be ordered via Visa or Mastercharge by calling 1-800-621-8335.

Generic Substitution Ruling

In May the Maryland Board of Pharmacy issued the following ruling: Physicians will no longer be able to write "DISPENSE AS WRITTEN" to require that pharmacists dispense the brand-name drug. Maryland's Medical Assistance Program, in compliance with federal law, mandates that when a specific brand-name drug is to be dispensed, the prescriber must write in his or her own handwriting on the prescription form the phrase, "BRAND MEDICALLY NECESSARY" or "BRAND NECESSARY." Under the Maryland Pharmacy Law, Health Occupations Article, Section 12-508(b)(1) Annotated Code of Maryland, the phrase "DAW" or "DNS" will not require the pharmacist to dispense the

brand name. This ruling (effective July 1, 1989) applies to all prescriptions for Medical Assistance beneficiaries.

Expenditure Targets

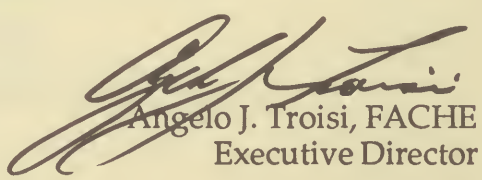
Med Chi thanks all its member physicians, component societies, and the Med Chi Auxiliary who wrote and phoned the Maryland US Representatives during Med Chi's drive to defeat expenditure targets. To order a summary booklet about Med Chi's expenditure targets campaign, contact Med Chi's Public Relations Department at 1-800-492-1056 or 301-539-0872 in Baltimore.

Clarifications

In the August 1989 issue of *MMJ*, Charles F. O'Donnell MD, Baltimore County Past President, Med Chi Past President and past AMA Delegate, appeared unidentified in a photograph with Dr. Roland Smoot (see page 657). Med Chi is proud of Dr. O'Donnell's contributions to organized medicine and to his community.

On page 723 of *MMJ's* September issue, the photograph of Montgomery County Medical Society President Cheryl E. Winchell MD was labeled as President-Elect. She assumed the presidency of Montgomery County in April.

AMA Opinions



The 1989 edition of *Current Opinions* of the AMA's Council on Ethical and Judicial Affairs is free for all AMA members. In addition, the AMA has released, *Reports of the Council on Ethical and Judicial Affairs*. This book, which provides guidelines to help practicing physicians in their decision making, is available to AMA members for $60. Both books can be ordered by calling 1-800-621-8335.

Med Sig Bulletin Board

Med Chi's Med Sig computer bulletin board provides announcements and updates on issues in medicine from the AMA, Med Chi, and around the state. Questions or requests for clarification of announcements in this newsletter may be entered directly into Med Sig. This enables Med Chi staff to respond to your requests almost immediately. For more information regarding the Maryland Med Sig Bulletin Board System, contact Med Chi's Computer Department at 1-800-492-1056 or 539-0872 in Baltimore.

Committee Selections for 1990-1991

Members interested in serving on a Med Chi Committee are reminded that committee selection forms for 1990-1991 will appear in the November, December, and January issues of *MMJ*. Please complete and return one of these forms indicating your interest in serving on one or more committees.

Angelo J. Troisi, FACHE
Executive Director

MARYLAND LAW REGARDING NOTICE OF PARTICIPATION IN THE MEDICARE PROGRAM

On July 1, 1985 a law was passed in Maryland requiring physicians to post a notice in their offices regarding their participation status in the Medicare program. It has been brought to our attention that some physicians are not complying with this law. Therefore, Med-Chi has developed the signs on the next 3 pages for your use. The appropriate sign should be detached and posted in your office.

The law, which is outlined in Section 14-705 of the Health Occupations Article of the Annotated Code of Maryland, states:

> If a physician is engaged in the private practice of medicine in this State, the physician shall display a notice written in English that is plainly visible to patients in the office of the physician concerning whether the physician:
> (1) Is a participating physician under the Medicare program and, therefore, accepts assignment for all Medicare claims;
> (2) Accepts Medicare assignment on a case-by-case basis; or
> (3) Does not accept Medicare assignment in any case.
>
> This requirement DOES NOT apply to a physician or group of physicians who:
> (1) Have exclusive contracts with a health maintenance organization;
> (2) Treat only the patients of the health maintenance organization; and
> (3) Agree to accept full assignment for covered services rendered.
>
> **A PERSON WHO VIOLATES ANY PROVISION OF THIS LAW IS GUILTY OF A MISDEMEANOR AND ON CONVICTION IS SUBJECT TO A FINE NOT TO EXCEED $5,000 OR IMPRISONMENT NOT EXCEEDING 5 YEARS OR BOTH.**

If you have any questions about this matter, contact the Med-Chi Government Relations Department at 539-0872 or 1-800-492-1056.

For My Medicare Patients

I PARTICIPATE IN THE MEDICARE PROGRAM
AND
ACCEPT ASSIGNMENT FOR ALL MEDICARE CLAIMS

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

_____

Physician's Signature

This sign was prepared by the Medical and Chirurgical Faculty of Maryland (The Maryland Medical Society) in accordance with Section 14-705(b) of the Health Occupations Article of the Annotated Code of Maryland.

For My Patients

I ACCEPT MEDICARE ASSIGNMENT ON A CASE-BY-CASE BASIS

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

Physician's Signature

This sign was prepared by the Medical and Chirurgical Faculty of Maryland (The Maryland Medical Society) in accordance with Section 14-705(b) of the Health Occupations Article of the Annotated Code of Maryland.

For My Patients

I DO NOT ACCEPT MEDICARE ASSIGNMENT IN ANY CASE

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

Maryland and International Health

Timothy D. Baker MD, MPH

Dr. Baker, a professor at The Johns Hopkins University School of Public Health and Hygiene, has 30 years experience in international health.

The year is 1793. Philadelphia has been visited by a disastrous epidemic of yellow fever. Baltimore citizens, aware of the contagious nature of yellow fever, take action to protect the city. A Board of Health is constituted - the first in the United States.[1] The first action of this Board is to hire four strong men to be posted on the Philadelphia Road to prevent possible carriers of yellow fever from coming to Baltimore. Thus, the first US City Health Department was created in an attempt to defend Maryland citizens from a yellow fever epidemic that originated in Latin America.

What has happened in the intervening 220 years makes up the substance of this special issue of the *Maryland Medical Journal.*

The articles address the role of physicians who lived in or were trained in Maryland in the control/eradication of four specific diseases: yellow fever, smallpox, malaria, and typhoid.

Although many US medical colleges have international health interests, Maryland is fortunate in having three schools that are leaders in the field of international health: Uniformed Services University of the Health Sciences, University of Maryland, and Johns Hopkins. Space in this issue did not permit complete descriptions of the extensive programs of these institutions. However, the interlinked areas of nutrition, population, and blindness are covered in three articles describing the research programs of Maryland institutions.

The hospitals and universities of Maryland have provided training for many international students who have returned to their home countries for positions of leadership in the health field. In addition to the foreign physicians who are trained here and who return home, there are many foreign medical graduates (FMGs) who are now serving the citizens of Maryland. An article discussing Maryland's debt to less developed countries for their FMGs begins on page 829.

An article by Dr. Alfred A. Buck, a Maryland-trained physician, describes one successful multinational research project and shows the difficulties and opportunities in international health work.

Baltimore is a port city with major international interests and sister cities in nine other countries. Dr. Hiroshi Nakazawa, Vice-Chairman of Med Chi Council and President of the Baltimore City Medical Society, is coordinator for the Kawasaki Sister City Program. Dr. John DeHoff, former president of Baltimore City Medical Society, is coordinator for the Cadiz Sisiter City Program. International trade, a significant part of Maryland's industry, brings many foreign seamen into Baltimore. Their health care is described by a port physician, John B. MacGibbon, who is also a foreign medical graduate from New Zealand. In addition, many Marylanders go overseas every year. These travelers are served by at least five travelers' clinics that are described by Drs. Sack, Herrington, and Baker.

An article on primary health care shows that what is learned in international health may be applied in areas such as Western Maryland.

As we worked on this special issue it became apparent that there were many more international health activities than could be covered in one *MMJ* issue. Readers who know of other important past

and present international health activities are invited to submit manuscripts for future issues of the journal.

We hope that Med Chi members will find a source of pride in the accomplishments of fellow Maryland physicians in international health.

The Broad Spectrum

International health: the words conjure up an image of Albert Schweitzer with his shock of snow white hair and rumpled linen suit standing by his bush hospital in Gabon, Africa.

International health is Albert Schweitzer and other missionary physicians, both religious and secular, but it is also much, much more and probably is best defined as any health activity between two or more nations. The activity may be:

1. *Multilateral* - The World Health Organization (WHO), UNICEF, and The World Bank, for example, with their many member nations joined together for joint direction and policy setting. Maryland physicians have served on the Governing Council, Executive Committee, and Expert Committees of WHO and for the World Bank and UNICEF.
2. *Bilateral* - Two nations make a unique agreement, such as the Agency for International Development's (AID) programs with a number of the less-developed countries of the world. Many Maryland physicians also have served with AID. USAID sponsored much of the work described on articles on population, blindness, and nutrition.
3. *Governmental* - Military units of the United States and many other nations have carried out international health programs. Today the Naval Medical Research Units in Cairo, Manila, and Jakarta provide excellent examples of cooperative health research projects, sponsored by the military, bringing health benefits to all people. Maryland physicians have played key roles in these projects. The article on Geographic Epidemiology (page 833) describes military sponsored international health research. The National Institutes of Health in Bethesda have a domestic focus but also have important international health programs such as the Fogarty Center.

Table 1 US Physicians in International Health

	Long-term Employees	Short-term Employees	Volunteers	Total
Clinical	340	66	253	659
Public health	172	187	56	417
Other & unspecified	125	56	160	341
Total	627	309	471	1,417

NOTE: Numbers from most recent survey (1981).[2] Slight increases may be expected from recent increased in US foreign aid for health.[3] See also NOTE Table 2.

4. *Quasigovernmental organizations* - The International Red Cross, for example, assumes responsibilities for activities such as health aspects of disaster relief and the health of refugees around the world in Thailand, Sudan, Angola, and Mozambique.
5. *Religious missions* probably still employ the largest number of US physicians in international health. Mission activities range from the modern tertiary hospitals of the Seventh Day Adventists in Hong Kong, Bangkok, and Taipei to the "bush" clinics of the Sudan Interior Mission. Many Maryland physicians have given their time to serve either short-term or long-term with religious mission health activities. Today there is still a need for physicians who have the missionary spirit to serve those countries in greatest need.
6. *Nonreligious, private, voluntary, organizations* (PVOs) CARE, Foster Parents Plan, Save the Children, Project HOPE, and many others offer opportunities for Maryland physicians to serve in international health.
7. In addition to these broad based, philanthropic public fund-raising agencies, there are *professional organizations* such as Health Volunteers Overseas, Orthopedics International, InterPlast, and Project Orbis that offer the opportunity for physicians, specialists in given fields, to volunteer their time to serve the medical needs of the poorest of the poor.
8. The great *endowed foundations* such as Rockefeller and Kellogg have had major programs in international health. The yellow fever article describes one Rockefeller Foundation activity. Other nations such as Japan and Italy are following the US lead.
9. *Universities* are playing an increasingly important role in international health through their research projects in the developing countries of the world and in the training of foreign students at the postgraduate, postdoctoral level.
10. With the recent major increase of funds for international health work, a large number of *consulting firms* have been set up to take advantage of funding opportunities. Located near the Washington Beltway these firms have been dubbed, somewhat pejoratively, "beltway bandits," however, some carry out excellent programs to benefit the health of people in developing nations. A few located in Maryland are thus part of the international health activities of our state.

Size of US International Health Effort

Although very recent figures are not available for the number of US health professionals engaged in international health activities, there are at least as many as shown in Tables 1 and 2.

Data are not available on the exact number of Maryland physicians involved in international health, but because of the major programs of the three educational institutions, Maryland probably contributes a greater share of U.S. health personnel overseas than indicated by the size of the state.

Only 0.3 percent of all US physicians are engaged in international health. The percentage in Maryland may be slightly higher than for the rest of the US. For comparisons with the number of foreign physicians coming to the United States, see the article on "Reverse Foreign Aid" on page 829.

The distribution of Maryland physicians among the various types of international health organizations may be estimated from Table 2.

Volunteer health professionals make up over 40 percent of the number in church-related organizations and 50 percent in private voluntary organizations. US "volunteer" physicians in less-developed countries often are not cost effective. If they do not speak the local language they will tie up health workers as translators. If they require special housing or medical equipment they often place a drain on scarce local resources. Peace Corps "volunteers" cost over $20,000 per year in support and back-up expenses,[5] more than the annual salary of the Minister of Health in many countries. Prospective volunteer Maryland physicians would be well advised to seek information from organizations such as Health Volunteers International (Dr. James Cobey, Washington Station POB 6515, Washington, DC 20035-5157; 202-290-0928) in seeking meaningful volunteer assignments.

Worlds Apart

Although the broad definition of international health includes the activities among industrialized nations, the focus of this issue is on Maryland scientists and institutions in the less-developed countries of the world. Readers should understand the great gulf that lies between the opulence of America and the less-developed countries of the world.

They are not a discrete block but rather a continuous spectrum from the poorest of the poor (such as Chad or Bangladesh with their intractable problems of poverty, ill health, and economic regression rather than development) to countries such as Chile, Taiwan, or Korea, which are entering the category of industrialized nations.

As Table 3 shows, the health of a nation as represented by infant mortality is very closely related to the economic level of the country. However, a few major exceptions show it is possible to achieve good health at low cost. Good health may be achieved by the interaction of a number of factors. Equitable distribution of financial resources makes the lot of the poorest fifth of the people less onerous and less life-threatening than it is in countries such as Brazil where the richest tenth of the population has far more than its share of the nation's wealth. The percent of the national income received by the poorest fifth of households in Sri Lanka is three times as great as the percent of the national income received by the poorest one-fifth in Brazil.

Female education is also highly correlated with better health (Table 4). In each economic level the higher percent female education is associated with better infant survival. It is not surprising that children of better educated mothers have a better chance to survive.

Table 2. US Health Professionals in International Health by Type of Organization [4]

	Number	Percent
Church related	2,199	33
Private voluntary	1,668	25
Universities	985	15
For profit	878	13
Government	867	13

NOTE: 2,000 additional US health professionals are estimated from a telephone random sample follow-up of international health organizations not responding to an initial survey. Although the follow-up sample was too small to estimate the number of physicians that should be added to the US totals, there would be less than 500.

Table 3. Relation of Economic Level To Health

	Per/cap[6] GNP	Favorable Exceptions	IMR*[7]	Av. IMR * for level	Unfavorable Exceptions	IMR*
High-Income Countries	$6,200			10	Saudi Arabia	85
	4,210	Trinidad	13			
Mid-income Countries	2,000			56	Brazil	63
	1,810	Malaysia	30			
Low income Countries	450			76	Indonesia	88
	400	Sri Lanka	30			

*Infant mortality rate

Table 4. Female Education and Infant Mortality

Economic Level	Secondary school age* females in school[6] percent	Infant Mortality Rate
High		
Saudi Arabia	1	85
Trinidad	78	13
Mid		
Brazil	16	63
Malaysia	22	30
Low		
Indonesia	7	88
Sri Lanka	64	30

*Data from year corresponding to average age of mothers.

Widely disseminated health services, particularly preventive services, seem to play a role in providing "good health at low cost" in certain of the less-developed countries such as China and Sri Lanka.[8]

The infant mortality levels in the poorest of the poor nations are far worse than they were a century ago in the United States. Frequently the statement is heard, "we have poverty and ill health in the United States, why should we be concerned about other nations?" The answer lies in the fact that "poverty and ill health" in the US would be "affluence and moderate health" in many of the poorest nations.

Maryland's physicians involved in international work in developing countries feel a moral commitment to help the truly destitute of the world.

Yellow Fever and Maryland Physicians

Timothy D. Baker MD, MPH

Dr. Baker is Professor, Department of International Health, Johns Hopkins University.

Tenacity, human-relations and scientific skills,and ability to recognize important scientific advances and implement them are human elements essential to the success of disease control programs whether in Brazil in the 1930s or in Maryland in the 1990s.

It was yellow fever that led to the founding of Maryland's first Board of Health. The article on Health Care of Merchant Seamen (on page 839) also describes yellow fever epidemics in Maryland. Physicians who worked or trained in Maryland deserve much of the credit for the control of yellow fever in the Americas. Early work done by Drs. Walter Reed, James Carrol, and Henry Carter laid the groundwork, but it was Dr. Fred Soper who effectively controlled yellow fever.

Dr. Fred Lowe Soper, the nemesis of yellow fever in the Americas, had his first training in international health work in Maryland in a special course for Rockefeller Foundation International Health Staff Members at the Johns Hopkins School of Public Health. While at Hopkins in 1919-1920, Soper met General William Gorgas, the Head of the Rockefeller Foundation's Yellow Fever Commission and Dr. Geraldo Paula Souza, who later founded The World Health Organization. After a two year field assignment in Brazil, Soper returned to Maryland and Johns Hopkins to earn his masters degree in Public Health. After a field assignment was in Paraguay,[1] his next contact with a Maryland institution was his receipt of the doctor of Public Health degree from Hopkins in 1925.[2]

Aedes Aegypti Eradication

Following the discovery that the *Aedes aegypti* mosquito was the vector of urban yellow fever by Finley in 1881 and confirmation by Walter Reed , who studied at Hopkins with William Welch MD, James Carrol, a University of Maryland graduate, and Dr. Lazear in 1900, antimosquito control was undertaken in urban areas initially by fumigation to kill adult mosquitoes, subsequently by antilarval measures. The detailed epidemiology was worked out by a University of Maryland Medical School graduate in the USPHS, Dr. Henry Carter, whose definitive work was published by the Johns Hopkins epidemiologist, Dr. Wade Hampton Frost. [3]

In the 1920s, the Rockefeller Foundation initiated a program to eradicate yellow fever in the Americas, starting in Brazil where the

first epidemic of yellow fever in the hemisphere was described.[4] The original strategy was to control the disease in major population centers, thereby eradicating the disease (although not the mosquito vector) in entire countries. However, in the late 1920s isolated rural outbreaks occurred, and yellow fever returned to Rio de Janeiro and other major population centers in Latin America.

Soper, by a careful survey of past work of the Rockefeller Foundation/Yellow Fever Service in Recife, Brazil, found inspectors had been falsified records. In collaboration with Brazilian colleagues he instituted a new system of supervision so *A. aegypti* surveillance would be "as certifiable as monthly bank balances." The successes of the intensified *Aedes* control program led Soper and his Brazilian colleagues to consider the bold goal of the *Aedes* mosquito vector eradication. In 1934 he proposed a program of nationwide Aedes eradication for Brazil.

The discovery of the monkey reservoir of jungle yellow fever gave impetus to the importance of an *A. aegypti* eradication program as the best defense against re-introduction of yellow fever to major urban centers in Latin America and port cities of the United States. The importance to Latin America of yellow fever and the eradication of *Aedes* was emphasized when Brazilian President Getulio Vargas urged *A. aegypti* eradication in his first annual report to the nation.

The successes of the Brazilian yellow fever organization in eradication of the *Aedes* from Brazil led quite naturally to the need for eradication in neighboring countries of Latin America. Soper was able to persuade the Pan American Health Organization to take up hemispheric *A.aegypti* eradication as a major program. By the 1950s the Pan American Health Organization had certified some 20 countries of Latin America as having eradicated *A.aegypti*. Unfortunately, the United States never attempted *A. aegypti* eradication. The mosquito was re-introduced into Latin America and the Caribbean in the 1950s, probably as larvae in the water in old tires shipped from the United States to Latin America and the Caribbean.

Although Soper's goal of hemispheric eradication of *A.aegypti* was not achieved, his well-planned and carefully supervised program freed the Americas from the menace of urban yellow fever epidemics. However, the recent dengue fever epidemics in the Caribbean serve as testimony to the consequences of *Aedes* re-introduction to urban centers in the American tropics. What Soper proved feasible in Latin American countries was not done in the US because of lack of political will.

Eradication of Anopheles Gambiae

Soper's second eradication effort was completely successful. In 1930, *Anopheles gambiae*, the most efficient and malignant vector of malaria, was introduced to Northeast Brazil from Africa. (Malaria is also discussed in an article by David Clyde on page 809.) A Rockefeller Foundation entomologist discovered *A. gambiae* in northeast Brazil and reported this information to Dr. Soper. Aware of the dreadful consequences of gambiae-borne epidemics of falciparum malaria, Soper attempted to persuade Brazilians to stamp out the invader before a solid beachhead was established. The Governor of the state where gambiae invaded was disinterested in paying for spraying programs; the Rockefeller Foundation was unwilling to commit major resources; the Brazilian government was insecure and hesitated to interfere in a state problem. [5]

The failure to heed Soper's warning led to a devastating epidemic of gambiae-borne malaria in the neighboring state of Ceara. In a survey report we find

> entire counties...are attacked...more than 90% of the population ill...towns, villages, large and small properties...extensive cotton and cereal plantations, cattle, etc. all lacking attention due to the shortage of labor...local authorities estimate total cases at about 60,000...11 deaths per day. [5,6]

The Cooperative Yellow Fever Service (CYFS) was given the assignment of containing the epidemic. The Rockefeller Foundation and the Government of Brazil allocated major resources. Under Soper's guidance, a Presidential decree was drafted, creating a malaria service of the Northeast that worked for the next three years to accomplish the eradication of *A. gambiae*. Securing the support of the Government of Brazil and the Rockefeller Foundation, a formidable task, would not have been possible without Soper's determination based on his realization that the burden of gambiae-borne epidemics of malaria would move Brazil's economy back to the 1700s.

Lessons Learned

Soper's career provides insight to essential human elements of disease control programs whether in Brazil in the 1930s or Maryland in the 1990s. Much of what Soper learned was passed on to another Maryland trained physician, Dr. D. A. Henderson, the eradicator of smallpox.

Tenacity was the most important element in Soper's persistence against the opposition of politicians, short-sighted Rockefeller Foundation executives, and most of all, the intransigent enemies: *A. gambiae* and *A.aegypti*. A less-determined individual would have been dissuaded from embarking in a campaign that fellow scientists and politicians alike said would be impossible.

Tenacity alone was not enough. Soper had excellent human relations skills. He was tough and demanding, but inspired loyalty in his subordinates and colleagues. (One of Soper's subordinates, fired with enthusiasm, threatened people with a revolver if they rejected hookworm treatment.) His ability to inspire loyalty was based on his complete honesty and integrity.

Soper had excellent scientific training to prepare him for his future successes. He had a short course at

Johns Hopkins School of Public Health before his first assignment. He then returned to take the certificate (master's) degree program, and then carried out research work leading to the Doctorate in Public Health.

A final attribute leading to Soper's success was his ability to recognize important scientific advances and implement them. He quickly apprehended the epidemiologic consequences of the cycle of jungle yellow fever that was discovered in Brazil and Colombia in the 1930s. He was able to build this factor into his program for the eradication of urban yellow fever in Latin America. The use of the viscerotomy needle[7] for diagnosis of yellow fever postmortem was a "low-tech" development, but one which Soper seized upon and made an important element in his yellow fever surveillance program. Soper also was quick to recognize the advantages of Paris Green as a larvacide and DDT as a vector insecticide.[8]

These three examples of Soper's ability to seize on important new elements and incorporate them to ensure the success of his program are strikingly similar to Dr. D. A. Henderson's skill in applying appropriate, high and low technology and scientific discoveries in the smallpox eradication campaign (see page 805). Dr. Henderson was a great admirer of Dr. Soper; it is not surprising that there are many similar attributes in these two "great eradicators."

Where do you draw the line?

As a mental health professional, you know that every patient represents a unique challenge. In most cases, you are able to meet each person's individual needs with effective treatment and positive results.

But there are some cases that frustrate the best efforts of the most dedicated professional . . . individuals whose problems seem resistant to every avenue of outpatient treatment. As a concerned professional, where do you draw the line between giving patients your best and drawing on the inpatient resources of others?

For more than 80 years, Taylor Manor Hospital has provided welcome support to fellow professionals faced with the patient in need of our inpatient setting. Our multi-disciplinary approach welcomes your input and provides a broad base of psychiatric services, including specialized treatment programs for adolescents, adults, young adults, addictive behaviors, and members of the ministering profession.

We're here to use all our experienced staff and facilities to assist you in working with your patients. For further information or to arrange admission, contact our Admissions Office at **1-800-527-8238, (301) 465-3322 or (202) 621-4965.**

D.A. Henderson: Bringing the Lessons of Smallpox Home

Winthrop Morgan MPH

The author is Program Officer, Population Communication Services, Center for Communication Programs at The Johns Hopkins University, Baltimore.

In October 1977, Dr. D. A. Henderson provided irrefutable proof that we have the power to conquer infectious diseases through cooperation, coordination, and common sense. Smallpox was dead. Since then Henderson has been applying the lessons of the successful smallpox campaign to improving the efficiency and effectiveness of the public health field.

Just about 12 years ago, after "10 years-9 months-and 26 days" (as Dr. Henderson rattles it off) of dedicated effort, he and his young team of epidemiologists, administrators, and technicians orchestrated the only successful eradication of a disease in the history of the world. Smallpox was dead. Subsequently Dr. Henderson has devoted his life to improving the efficiency and effectiveness of the public health field by leading the attack on vaccine-preventable childhood diseases, such as poliomyelitis, and has participated in extraordianry advances in combating diarrheal diseases, vitamin deficiencies, and respiratory illnesses. Here at home, Dr. Henderson is gathering forces to face more tough problems: teenage pregnancy, drug abuse, and the spread of AIDS.

Donald Ainslie Henderson was raised in the small suburban town of Lakewood, Ohio, earned his AB at Oberlin College (1950) and received his MD from University of Rochester School of Medicine (1954), where his interests ran more toward internal medicine than the "lowly profession of public health." Completing his internship and residency in internal medicine at the Mary Imogene Bassett Hospital in Cooperstown, NY in 1955 he joined the Epidemic Intelligence Service (EIS) of the US Centers for Disease Control as its chief, where he served his obligatory two years in the uniformed services.

Of his first exposure to the field of epidemic intelligence, Henderson recalls, "Suddenly, I was immersed in infectious disease epidemiology and public health. Every day was an adventure. It was simply too exciting a field to ever think of returning to clinical medicine." In 1959 Dr. Henderson came to Johns Hopkins School of Hygiene and Public Health to study under the world-renowned epidemiologist and chronic disease specialist (and native Marylander) Abraham Lilienfeld. Lilienfeld instilled in Henderson the value of having your data guide your disease control program; this lesson became a key in Henderson's smallpox attack strategy that would led to success where so many other campaigns had failed. Henderson earned his Master in Public Health (1960)

under Lilienfeld's guidance and formed a friendship with his mentor that led him back to Hopkins as dean almost 20 years later.

Returning to work with the CDC following his graduate study, Henderson became deeply involved in surveillance and containment of infectious disease outbreaks in the United States as chief of the surveillance section of the EIS, working with Dr. Alexander D. Langmuir on eradicating poliomyelitis and combating Asian influenza, infectious and serum hepatitis, and measles. Here he became practiced in the techniques of disease reporting and surveillance and containment procedures for epidemic control that would prove the cornerstone of the successful smallpox eradication effort worldwide.

In his work at the US Center, Henderson first became involved in international health through the smallpox eradication program. While this disease had been effectively eradicated from the United States some time before, Henderson and his colleagues periodically were asked to consult with US Agency for International Development and other foreign assistance personnel in the government to develop effective plans for mass immunization efforts in developing countries. In 1965, the United States became involved in a growing interest of the World Health Assembly to eradicate smallpox. The government committed technical and financial support to this ambitious undertaking by coordinating a regional vaccination effort in Western and Central Africa that would include smallpox vaccinations. Henderson, as Chief of Surveillance, was asked for his appraisal of the project plans. When he expressed well-informed skepticism in a memorandum to his superiors, they tapped him as principal redesigner and strategist for the program.

The more Henderson brought to light the logistical, strategic, and sociopolitical difficulties involved in such a campaign, the more responsibility he was given to develop an effective plan for overcoming the obstacles with regard to smallpox. By January 1, 1967, Henderson found himself in Geneva at the World Health Organization as the head of a talented but meager core staff of 10 and fewer than 100 ancillary staff worldwide; his mission impossible was to wipe out smallpox from the face of the earth within 10 years.

In his first year as director of the Smallpox eradication program, as many as 10 to 15 million cases of smallpox were occurring worldwide, causing two million deaths and countless numbers "walking wounded" suffering permanent disfigurement and blindness. Nomadic tribes resisted attempts to report the disease among them as they carried it from place to place, and in some areas, primitive variolaters attempting a crude form of vaccination by rubbing infected scabs into the skin of healthy persons were spreading more of the disease more than they were preventing. Against this, Henderson was armed with under 10 million dollars a year and a staff of fewer than 100 worldwide to battle a disease killing more people on more fronts than did any war in history.

Yet just over 10 years later, on October 26, 1977, the last case of naturally occurring smallpox was treated and the virus contained and destroyed in Somalia, East Africa. Almost 200 years after Edward Jenner developed an effective vaccine against it, the scourge of over 3000 years was banished from the world. Henderson and his team had done the impossible.

Henderson did more than simply remove a nemesis from the world of public health. He also provided an approach to attacking health problems that hitherto had not been applied. "It seems like common sense that you would keep a good record of what problems you have, and let you data drive your program," says Henderson.

> But until the smallpox program came along, nobody had done this. One of the most important things we did was establish a reporting system that told us where we should be using our resources. We needed that, because we never had enough resources to waste....Another thing we did was look for young, bright people who hadn't been around long enough to be told something was impossible. We also learned to get out in the community. We saw people trying to run vaccination campaigns out of hospitals and clinics. You would get maybe at best 50 percent coverage. When we went into the community with a couple of people, we could get 80 or 90 percent coverage. Community based problems need community based solutions. It's a lesson we still need to learn at home.

Around 1977 Henderson was ready to bring home the lessons he had learned in a decade of being at the forefront of public health fieldwork around the world. While he was considering his next challenge, his former professor and good friend Abraham Lilienfeld convinced him to take over the deanship of Hopkins School of Hygiene and Public Health. The decision to return to Baltimore was not difficult for Henderson:

> I came here because the Baltimore-Washington area is the most exciting place for a health professional to be. Baltimore is the health center of the world. We have the Hopkins Medical Institutions, University of Maryland, National Institute of Health, Walter Reed, Food and Drug Administration, Health and Human Services, and so many more exciting opportunities for collaboration at the national, state, and city levels. Right here is where we can try new approaches to solving our health care problems.

Dean Henderson brought with him a desire to expand, improve, and upgrade everything around him; school, city, state, and nation. The man who had lived out of a suitcase in the far reaches of the world settled in Maryland and went to work to apply the lessons he had learned to our needs.

He began with the School itself. From the time Henderson became Dean, the resources of the School have grown from under $17 million dollars to over $100 million per year. Over 300 full-time faculty now teach at the East Baltimore campus, and many have worked in over 50 countries throughout the world. Hopkins researchers have shared responsibility for the development of oral rehydration salts, which have contributed to the decrease of deaths due to diarrheal diseases by as much as 50 percent in countries such as

Egypt. They have demonstrated a link between vitamin A deficiency and immunosuppression in children and have developed programs for Vitamin A supplementation that offer life-saving potential. They have pioneered work in community based distribution networks, following the lessons of the smallpox campaign.

A resident of Baltimore for over ten years, Dr. Henderson is especially concerned with increasing the School's involvement (and his personal involvement) with local and regional agencies, industry, and labor concerned with our health problems. Not a stranger to overwhelming problems, he is quick to note that teenage pregnancy, drug abuse, and the AIDS epidemic are better attacked through community based work rather than from the hospitals, jails, and agency hallways that are the front for the current attack. In developing countries, says Henderson, "We learned quickly that you couldn't run a vaccination program out of a health center or hospital. Here at home, we haven't learned that lesson: we try to combat teenage pregnancy from a hospital or doctor's office then wonder why we fail."

Henderson's strong advocacy of community based approaches is complemented by an astute understanding of the need for political support for the fight. He recalls an example from the smallpox campaign that provides a lesson for us:

> When we came into India to work with smallpox, they had been working for almost 15 years without much success. Then Indira Ghandi got interested in the problem, partly because we made sure she knew that [rival] Pakistan's program was doing so well. Within two or three years, smallpox had been eradicated from India.
> But today, I hear that our Surgeon General left office without having the opportunity to discuss even the AIDS epidemic with our President. These issues deserve more attention; without the support from the top, we cannot beat them in our communities.

Henderson takes this committment to community action to his deanship at Hopkins. He believes it is the responsibility of the School of Public Health to collaborate on projects within the area.

> I have met with the Governor and with Mayor Schmoke several times to discuss how we can work together for Maryland's health. With the unique resources we offer comes a responsibility. We need to see ourselves as a professional school: students should be practicing before they leave here. Our tradition of doing this has been expanding over the years that I've been here.

Examples of recent work in the Baltimore area include some of the first scientific community based research on intravenous drug abuse and AIDS, drug-free hypertension control therapy in high schools, and evaluation and consultations with a Baltimore "rap" group bringing AIDs prevention messages to teens around the state.

Henderson believes there is room for much more cooperation between state and local agencies and the School. "But," says the dean, "part of the problem is that the state and local agencies are bureaucracies; and we're no better. Many of their administrators and our teachers think the same way. It's hard to get them to think of spending part of time in the classroom and part of the time out in an agency." Henderson explains he would like to see all Maryland health professionals consolidate their efforts on public health problems. He thinks combining academic and professional expertise in the field and in the classroom will help generate creative solutions to Maryland's problems.

Dr. Henderson has great expectations for the future of Hopkins, Maryland, and the tackling of problems great and small; in fact, he believes this is the most exciting time to be in the growing field of public health.

> When I entered the field, nobody was interested in public health; it didn't offer career prestige, money, or the ability to make real changes. Now, this is the most exciting time to be in public health. In part due to our success with smallpox, many of the best physicians, scientists, economists, sociologists, and administrators are attracted to the field. I see the best come through our School.

Armed with the "moral suasion" techniques he learned in the smallpox campaign, Dean Henderson continues to seek a melding of the strengths of Hopkins and the Maryland health care community to tackle some of the more serious problems at home, applying lessons learned in Haiti, Honduras, and the Horn of Africa to Highlandtown, Homewood, and the community that the Hendersons now call home. ■

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:
Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service.* Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

One Clear Choice

When a physician's reputation and financial security may be on the line, we believe that simply choosing a good medical malpractice insurance company is not enough. Price and customized coverage should be the *very* best match for your needs... today *and* in the future. Service, by broker and company alike, should meet equally high expectations. At the Harjes Agency, we believe your best medical malpractice choices begin when you have chosen the best broker.

The Best Choices Begin with the Best Broker

Harjes Agency Inc.

4 North Park Drive
Suite 112
Hunt Valley, Maryland 21030

Licensed Broker
Advisor

Denise has been providing reliable malpractice advice to Maryland physicians since 1982. Call Denise and discover why the Harjes Agency, Inc. has become the medical malpractice broker of choice for so many Maryland physicians.

Malaria in Maryland since 1960: Incidence and Research

David F. Clyde MD, PhD

Dr. Clyde is an adjunct professor, The Johns Hopkins School of Hygiene and Public Health, and research professor of medicine, University of Maryland, Baltimore.

Immediately prior to US involvement in Vietnam, less than 3 cases of malaria were reported from Maryland each year, in contrast to current identification of 10 times that number.

In recent years, the number of cases of malaria annually reported to the Atlanta Centers for Disease Control from Maryland has been around 30, or 3 percent of the cases nation wide (Table).[1]

These figures do not include infections induced in volunteers for research purposes nor those reported from the District of Columbia. Local transmission, other than very rarely through contaminated blood transfusion, is not thought to have occurred in Maryland for several decades, although in the warmer months the common North American vector mosquito, *Anopheles quadrimaculatus,* is widely distributed in the state, particularly at lower altitudes around the Chesapeake Bay.

The increase in cases seen in Maryland and in the United States is attributable to a greater volume of immigrants from countries where the disease is endemic, and to a marked increase in Americans visiting those countries and returning with the infection. One third of the cases seen in the United States develops in Americans returning from visits or tours abroad. The foreign sources have been Asia in 40 percent of cases (the majority from India), Africa in 30 percent, and Middle and South America in 30 percent (the majority from Mexico). During the period 1983 to 1986 the greatest number of returning Americans developing falciparum malaria (the most dangerous type of the disease) had contracted their infections in sub-Sahara Africa, and of 28 individuals dying mainly from cerebral complications, 21 had returned shortly before from that continent. The incidence in the United States, however, is small compared to the estimated 500 million cases worldwide among a population at risk in transmission areas of 2,700 million, half of whom are children. In this country, active transmission virtually disappeared soon after the end of World War II, although the vectors persist.

During the 1950s and 1960s, vigorous campaigns to eradicate malaria were mounted in most affected countries except those of equatorial Africa. The operations, coordinated by the World Health Organization, were based on the spraying of DDT in houses to destroy resting mosquitos, and on the general distribu-

Table. Cases of Malaria Reported to CDC from Maryland and from the United States, 1960 - 1989

5-Year Periods	Annual Mean No. of Cases In Maryland	Annual Mean No. of Cases In USA	No. of Maryland Cases as % of USA Cases
1985-1989*	30.4	1,014.0	3.0
1980-1984	32.8	1,265.2	2.6
1975-1979	20.4	603.2	3.4
1970-1974	30.8	1,339.6	2.3
1965-1969	35.4	2,630.6	2.2
1960-1964	2.5	89.0	2.8

*For the whole year 1989, the incidences have been prorated from data reported January 1 to May 26. Annually at the height of American involvement in Vietnam (1967-1971) the numbers were 52.6 for Maryland and 2,573.4 for USA, the Maryland percent of total US cases being 2.04.

tion of chloroquine to reduce the parasite reservoir in the human population (Photo). Success was achieved in many places, and the prevalence of malaria greatly reduced, but only rarely could the gains be consolidated and maintained.

By the end of the 1960s it was apparent the massive and costly campaigns could not be afforded indefinitely, and technical problems, principally an increasing insusceptibility of mosquitos to DDT and other insecticides and of *Plasmodium falciparum* to chloroquine, made it necessary to revert to the traditional antimalaria methods centered on control of mosquito breeding and treatment of patients until research could provide new weapons. Such research, commenced at the University of Maryland School of Medicine earlier that decade, encompassed studies on chemotherapy of falciparum and vivax malaria, on the insusceptibility of many Americans of African descent to vivax malaria, and on the identification of vaccines against the disease.

Antimalaria Drug Studies

The spread of falciparum malaria resistant to chloroquine catalyzed a program of antimalarial drug development initiated by the US Army in World War II and revitalized in response to treatment problems encountered during the hostilities in Korea and Vietnam.[2] Based at the Walter Reed Army Institute of Research (WRAIR) and funded by the Army Medical Research and Development Command directly and through contracts to collaborating institutions, the Army Malaria Drug Develoment Program served to identify potential drugs and have them evaluated for tolerance and efficacy in animal and human testing systems. Prominent among the available systems was the volunteer facility maintained by the Department of Medicine (Chairman: Theodore E. Woodward MD) of the University of Maryland School of Medicine at the Maryland House of Correction, Jessup. The infectious diseases research program at that facility was administered by Richard B. Hornick and included among the professional staff Myron M. Levine, at present directing the Center for Vaccine Development of the University, the successor to the Jessup program, which closed in 1975. Studies designed to evaluate new chemotherapeutic and immunologic methods in a number of major communicable diseases (including malaria) were undertaken within strict institutional guidelines governing safety of the procedures and material employed and required informed consent of the volunteers.

Malaria studies at Jessup and on the medical school campus were designed mainly to ascertain safety and

PREVENTION OF MALARIA[1]

Drug of Choice	Adult Dosage*	Pediatric Dosage*
Chloroquine phosphate[2] *(Aralen)*	300 mg base (500 mg salt) orally, once/week beginning 1 wk before and continuing 6 wks after last exposure	5 mg/kg base (8.3 mg/kg salt) once/week, up to maximum adult dose of 300 mg base
Chloroquine-Resistant Areas		
Chloroquine[2]	as above	
plus Pyrimethamine-sulfadoxine *(Fansidar)*[3]	Carry a single dose (3 tablets) for self-treatment of febrile illness when medical care is not immediately available	<1 yr: 1/4 tablet 1-3 yrs: 1/2 tablet 4-8 yrs: 1 tablet 9-14 yrs: 2 tablets
plus Proguanil[4] (in Africa south of the Sahara)	200 mg daily during exposure and 4 weeks afterwards	<2 yrs: 50 mg daily 2-6 yrs: 100 mg daily 7-10 yrs: 150 mg daily 10 yrs: 200 mg daily
OR Chloroquine[2]	as above	
plus Doxycycline[5]	100 mg daily during exposure and 4 weeks afterwards	>8 years of age: 2 mg/kg of body weight orally/day, up to adult dose of 100 mg/day

* d indicates day. Dosage is oral unless otherwise stated.

1. At present, no drug regimen guarantees protection egainst meleria. If fever develops within a yeer (particularly within the first two months) after travel to malerious ereas, travelers should be advised to seek medicel attention. Countries with e risk of malaria were listed in The Medical Letter, volume 29, page 53, 1987, but the number of sreas reporting chloroquine resistence continues to increese. Travelers to any of these countries should be advised to avoid mosquito bites by using insect repellents conteining diethyltoluamide ("deet" – Medical Letter, 27:62, 1985) end using mosquito netting when sleeping in exposed ereas.
2. For prevention of atteck efter departure from ereas where *P. vivex* and *P. ovale* are endemic, which includes almost all areas where malaria is found (except Haiti), some experts prescribe primequine phosphete (t5 mg base (26.3 mg)/d or, for children, 0.3 mg base/kg/d, x t4d). Others prefer to avoid the toxicity of primaquine and rely on surveillance to detect cases when they occur, particularly when exposure was limited or doubtful. Primaquine can cause hemolytic anemia, especially in petients whose red cells are deficient in glucose-6-phosphate dehydrogenase. This deficiency is most common in Blecks, Orientals, end Mediterraneen peoples. Patients should be screened for G-6-PD deficiency before treatment. Primaquine should not be used during pregnancy.
3. Recommended for trevel to Africe south of the Sahere, the Indian subcontinent, South America (except the Amazon basin), Oceanie, Hainen Islend and the southern provinces of China. Use of *Fensider*, which conteins 25 mg pyrimethamine and 500 mg sulfadoxine per tablet, is contraindicated in patients with a history of sulfonamide or pyrimethamine intolerance, in pregnancy at term, and in infants less then two months old.
4. Proguanil (*Paludrine* – Ayerst, Canada; ICI) is not evaileble in the USA.
5. In Southeast Asie end the Amazon besin. The FDA considers use of tetrecyclines as antimalarials to be investigational. Use of doxycycline is contraindicated in pregnancy and in children less than eight years old. Physicians who prescribe doxycycline as melarie chemoprophylaxis should advise patients to limit direct exposure to the sun to minimize the possibility of a photosensitivity reection. Young children or other travelers who cannot teke doxycycline should carry *Fansidar*.

These two charts are reprinted with permission from **The Medical Letter on Drugs and Therapeutics,** February 12, 1988, pp. 23-24.

efficacy of candidate chemotherapeutic agents supplied by WRAIR. Ancillary to this were investigations into the biologic, immunologic, and drug response characteristics of strains of *P. falciparum* and *P. vivax* emanating from Vietnam, Malaysia, Thailand, Burma, the Solomon Islands, New Guinea, the Philippines, Tanzania, Panama, and El Salvador, and of the potential for malaria transmission of several species of domestic and foreign Ampheles mosquitos maintained by entomologist Vincent C. McCarthy in colonies at the medical school. A number of collaborators across the country were sent blood and other samples for independent study.

The chemotherapeutic work was undertaken between 1965 and 1975. Prominent among the compounds tested for tolerance and safety in stepped doses, and for efficacy against mosquito or blood-induced infections,were two series, quinoline methanols and phenanthrene methanols, that proved to be both safe and efficacious against chloroquine-resistant falciparum malaria[3] The ultimate products of each of these series, mefloquine and halofantrine, are of major therapeutic importance today. Other drugs that were examined and continue to be valuable included tetracyclines, clindamycin, and combinations of sulfones, sulfonamides, and folic acid antagonists.[4] The continuing utility of established drugs such as the 4-aminoquinolines, quinine, and primaquine was repeatedly checked against newly isolated strains of the human plasmodia.[5]

Photo. Malaria residual spraying in India (TCM).

TREATMENT OF MALARIA

Drug			Adult Dosage	Pediatric Dosage
All *Plasmodium* except Chloroquine-Resistant *P. falciparum*				
ORAL				
Drug of choice:		Chloroquine phosphate[1,2]	600 mg base (1 gram), then 300 mg base (500 mg) 6 hrs later, then 300 mg base (500 mg)/d x 2d	10 mg base/kg (max. 600 mg base), then 5 mg base/kg 6 hrs later, then 5 mg base/kg/d x 2d
PARENTERAL				
Drug of choice:		Quinine dihydrochloride[3]	600 mg in 300 ml normal saline IV over 2 to 4 hrs; repeat q8h until oral therapy can be started (max. 1800 mg/d)	25 mg/kg/d; give 1/3 of daily dose over 2 to 4 hrs; repeat q8h until oral therapy can be started (max. 1800 mg/d)
	OR	Quinidine gluconate[4,5]		
Alternative:		Chloroquine HCl[2]	200 mg base (250 mg) IM q6h if oral therapy cannot be started	Not recommended
Chloroquine-Resistant *P. falciparum*				
ORAL				
Drugs of choice:		Quinine sulfate[6,7]	650 mg tid x 3d	25 mg/kg/d in 3 doses x 3d
		plus pyrimethamine	25 mg bid x 3d	<10 kg: 6.25 mg/d x 3d 10-20 kg: 12.5 mg/d x 3d 20-40 kg: 25 mg/d x 3d
		plus sulfadiazine	500 mg qid x 5d	100-200 mg/kg/d in 4 doses x 5d (max. 2 grams/d)
Alternatives:		Quinine sulfate[7,8]	650 mg tid x 3d	25 mg/kg/d in 3 doses x 3d
		plus tetracycline	250 mg qid x 7d	5 mg/kg qid x 7d
PARENTERAL				
Drug of choice:		Quinine dihydrochloride[3]	same as above	same as above
	OR	Quinidine gluconate[4,5]		
Prevention of Relapses: *P. vivax* and *P. ovale* only				
Drug of choice:		Primaquine phosphate[9]	15 mg base (26.3 mg)/d x 14d or 45 mg base (79mg)/wk x 8 wks	0.3 mg base/kg/d x 14d

1. If chloroquine phosphate is not available, hydroxychloroquine sulfate is as effective; 400 mg of hydroxychloroquine sulfate is equivalent to 500 mg of chloroquine phosphate.
2. In *P. falciparum* malaria, if the patient has not shown a response to conventional doses of chloroquine in 48-72 hours, paresitic resistance to this drug should be considered. Intramuscular injection of chloroquine is painful and can cause abscesses.
3. Available in the USA only from the Centers for Disease Control, telephone 404-488-4046 (nights, weekends, or holidays call 404-639-2888). *P. falciparum* infections from Southeast Asia may require a loading dose of 20 mg/kg (NJ White et al, Am J Trop Med Hyg, 32:1, 1983).
4. Considered an investigational drug for this condition by the U.S. Food and Drug Administretion.
5. Optimal dosage for treatment of malaria is currently under investigation. For up-to-date information, telephone the Centers for Disease Control (daytime 404-488-4046; nights, weekends, holidays 404-639-2888). EKG monitoring is necessary to detect arryhthmias. Some experts consider quinidine more effective than quinine.
6. Quinine alone will usually control an attack of resistant *P. falciparum* but, in a substantiel number of infections, particularly with strains from Southeast Asia, it fails to prevent recurrence; addition of pyrimethamine and sulfadiazine lowers the rate of recurrence.
7. For treatment of *P. falciparum* infections acquired in Thailand, quinine should be given for seven days instead of three, combined with seven days of tetracycline.
8. Quinine plus tetracycline may be the regimen of choice in areas such es Thailand where resistance to pyrimethamine plus sulfonamides is common.
9. Primaquine phosphate cen cause hemolytic anemie, especially in patients whose red cells are deficient in glucose-6-phosphate dehydrogenase. This deficiency is most common in Blacks, Orientals, and Mediterranean peoples. Patients should be screened for G-6-PD deficiency before treatment. Primaquine should not be used during pregnency.

Genetic Insusceptibility

It had long been realized that many Africans and Americans of African descent were specifically insusceptible to vivax malaria. Investigations undertaken at NIH and elsewhere suggested the cause was related to the absence of the genetically determined Duffy blood-group antigens that served as red cell receptors for the merozoites of *P. vivax*. Clinical confirmation of the association between Duffy-negative phenotype and lack of susceptibility to mosquito-borne and blood stage induction of *P. vivax* infections was obtained in 1975 by studies in volunteers at Jessup.[6]

Malaria Immunization Studies

In 1971 the Maryland program was expanded to include a trial of immunization against human malaria. Studies at New York University had shown that mice could be protected against rodent malaria by immunization with X-irradiated sporozoites inoculated by syringe or mosquito bite.[7] Following demonstration in volunteers at Jessup and the medical school that inoculation of large numbers of sporozoites of *P.*

falciparum and *P. vivax* by irradiated mosquitos was both safe and immunogenic, an attempt was made to immunize three volunteers against *P. falciparum* sporozoites. When their antisporozoite immunity was challenged by infective nonirradiated sporozoites, one of the men did not develop malaria.[8] He continued to be immunized and challenged over a period of several months with sporozoites of *P. falciparum* strains collected in countries around the world, and remained protected. When challenged by inoculaton of blood stages of that species, or sporozoites of *P. vivax*, he developed malaria. Before the study ended in 1975, a scientist at the medical school had been successfully immunized in the same manner against both *P. falciparum* and *P. vivax* sporozoites of a worldwide variety of strains,[9] and another volunteer at Jessup against the latter species alone.[10] This work demonstrated for the first time that people could be immunized against sporozoites of the two main species of malaria parasite and that the immunity was species specific, did not extend to the blood stages of infection, and lasted up to six months.

Although it was impractical to vaccinate people residing or visiting tropical countries by having them bitten by many hundreds of infected irradiated mosquitos, the success of the Maryland study, confirmed by similar work undertaken by the Naval Medical Research Institute,Bethesda, collaborating with the Rush-Presbyterian-St Luke's Medical Center, Chicago, [11] gave impetus to the development of candidate vaccines when the requisite technology became available.

During the early 1980s at NYU, at WRAIR, and at other institutions, the biochemical and genetic characteristics of the sporozoites were revealed, permitting construction of synthetic peptide and recombinant sporozoite immunogens. Some of these are being tested in volunteers at the Center for Vaccine Development of the University of Maryland, in a program supported by the Agency for International Development through the NIH. The objective is to identify vaccines that may be used to reduce the devastating impact of malaria on inhabitants of tropical countries and to protect visitors to those countries and following their return home to Maryland or other states.

Typhus, Typhoid, and T.E.W.

William E. Woodward MD

Dr. Woodward, son of Dr. T. E. Woodward, is Corporate Medical Director, McCormick & Company, Inc., Hunt Valley.

Theodore E. Woodward's initial discovery of the cure of typhoid may have been serendipitous. If a Malayan candle had burned more brightly, perhaps the treatment of the first case of typhoid would not have occurred. But in retrospect, the author now believes the process of cerebral illumination that had taken place made the discovery inevitable.

In his aptly but inelegantly titled book, *Rats, Lice and History,* Hans Zinsser speaks of typhus fever as a disease that has affected the history of the world more than have all of its generals and politicians.[1]

Never has this been more true than during times of war, when typhus and other camp followers have decimated soldiers and civilians alike. As recently as the Vietnam conflict, many US troops, allies, and enemy fell victim to a variant, scrub typhus, caused by *Rickettsia tsutsugamushi.* Although morbidity was considerable, mortality on the US side was virtually nil. This had not been true during World War II, when scrub typhus swept through American ranks in the South Pacific and claimed 20 percent of those it attacked.

Field Study: Typhus

As a result of the latter experience, in 1948 a small medical team was placed in Kuala Lumpur, Malaya (now Malaysia). The five physicians had been tested by typhus during the Second World War; all knew its consequences. Some had been members of the US Army Typhus Commission during World War II, and at least one had contracted typhus while studying it in Morocco in 1942. Dr. Joseph E. Smadel had assembled four other physicians (each with a particular specialty), Drs. Herbert L. Ley Jr., Cornelius B. Philip, Robert Traub, and Theodore E. Woodward (T.E.W.), chosen for his clinical skills.

Clinical skills were important since the team was formed to test the efficacy of a new antibiotic against scrub typhus. The drug, Chloromycetin (chloramphenicol), had been developed by Parke, Davis and Company[2] and found effective *in vitro* against the causative rickettsiae.[3] But the drug was in very limited supply and could not be "wasted" on those with other diseases. Hence the need for a clinician to distinguish the various febrile illnesses before laboratory results became available.

Leaving his wife, Celeste, also a physician, and young children in Baltimore, Woodward traveled to Singapore, where the group

was met by Dr. R. Lewthwaite, a British scientist with extensive experience in scrub typhus, who accompanied them to Kuala Lumpur. There the team set up a laboratory facility, including space for entomologic studies, in the Institute for Medical Research directed by Dr. Lewthwaite. Conditions for treatment of scrub typhus were less than ideal. Woodward was required to travel throughout the city in search of patients in different hospital wards and clinics. Patient #18, a 30-year old Malay male, was admitted late in the evening with an 8-day history of headache, malaise, toxemia, diarrhea, and remittent fever. Conducting his examination by candlelight, Woodward made a tentative diagnosis of typhus and began the patient on chloramphenicol. In the light of the next day, the patient was regarded as having typhoid (subsequently confirmed by blood culture) but was continued on the antibiotic. Although he showed no improvement in the first 24 hours, by the end of the third day the patient was markedly better and without fever.

Typhoid studies

These observations prompted the group to initiate a parallel clinical study of typhoid.[4] Nine additional patients with typhoid were treated, and eight patients, receiving only supportive treatment, served as controls. The results confirmed the drug's efficacy. The duration of fever was 3.5 days in treated cases, 26 days in controls. Two of the treated patients relapsed after 10 and 16 days of becoming afebrile; both responded promptly to a second course of antibiotic. Two other treated cases suffered serious complications, one with intestinal perforation on the second afebrile day and one with massive intestinal hemorrhage on the fourth afebrile day. Both recovered after stormy courses.

Thus started Woodward's formal study of typhoid fever, which has continued to the present.

Jessup program

In 1958, four years after succeeding Dr. Maurice Pincoffs as the chairman of the Department of Internal Medicine at the University of Maryland, Woodward began a series of unique studies at the Maryland House of Correction in Jessup. The program (which continued for 17 years) was designed to study the pathogenesis and prevention of various infectious diseases unique to man and for which there was (and is) no satisfactory animal or laboratory model.

Among them was typhoid. We tend to forget how much of a problem this disease has been in our not-too-distant past. In 1930, the first year for which figures are available from the Center for Disease Control, 27,201 cases of typhoid fever were reported nationally, representing 22 cases per 100,000 population (Figure 1); undoubtedly only a fraction of those that occurred. Long recognized as an illness affecting children and young adults (Figure 2), it was with some parental trepidation that children of the author's vintage were allowed to go swimming, especially during the late summer months when the disease was particularly prevalent. By the time of discovery of a specific cure, the incidence of typhoid in the US had declined precipitously, due primarily to the increased availability of safe drinking water, sewage disposal, and public health education, and not due to any specific intervention by the medical community. Thereafter disease incidence decreased more gradually, reaching its present level of about 400 cases annually, with half being imported from abroad. It still may occur in explosive fashion as a 1973 outbreak of 222 cases in migrant workers in Dade County, Florida attests. In other countries, however, it remains hyperendemic. In Jakarta, Indonesia, typhoid is the second leading cause of hospital admission and death in 10-29 year olds (author's unpublished observations).

Parenteral Vaccines

The first typhoid vaccine was produced by Sir Almroth Wright in England in 1896.[5] It consisted of killed typhoid bacilli and was given by injection to a horse and two British colonial medical officers. One of the latter was subsequently challenged with viable or-

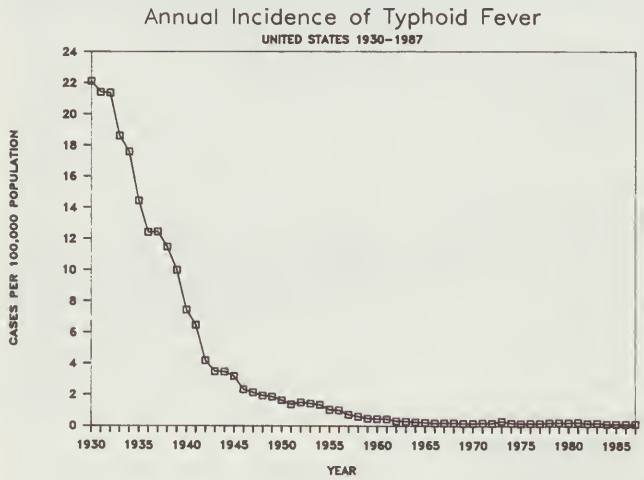

Figure 1

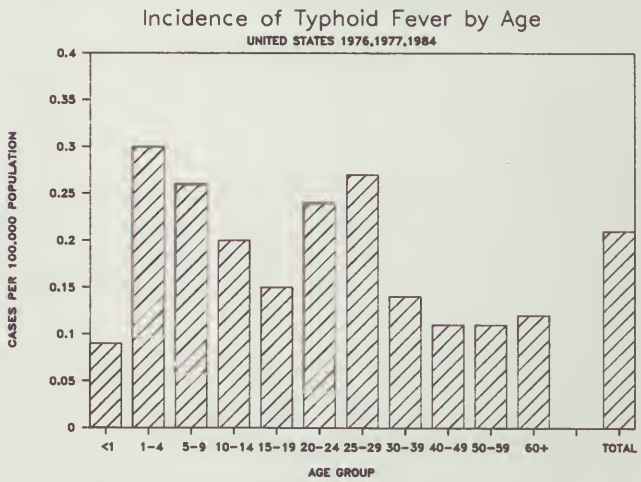

Figure 2

ganisms and remained well. It was largely on this basis that tens of thousands of British troops and officers were immunized during the Boer War in South Africa at the turn of the century. And it was on this basis that Russell in 1911 made killed parenteral vaccines mandatory in the US Army, a practice that persisted for decades.

A host of largely uncontrolled trials of parenteral vaccine ensued over the next half century. Results were contradictory. It was not until the late 1950s and early 1960s that the first properly controlled field trials were conducted in Yugoslavia, British Guiana, Poland, and Russia, all but the last under the auspices of the World Health Organization.[6,7] The most widely quoted study in British Guiana showed protection of more than 90 percent with an acetone-inactivated and dried preparation of whole cells given to school children. It was not possible, however, to determine any effect of prior immunity acquired by natural exposure to disease in this hyperendemic setting.

With this knowledge, the Jessup volunteer studies were conducted by Woodward, a host of other investigators under his tutelage, and his longtime associate, Dr. Richard B. Hornick. A total of 67 clinical protocols were undertaken over the years, with the ultimate goal of developing a more effective vaccine.

The studies employed almost exclusively the Quailes strain of typhoid, derived from a chronic carrier, in order to eliminate the vagaries of strain variability. Among many findings, these are of special note:

1. The infectious dose was established. One thousand organisms did not cause illness; 100,000 organisms caused illness in 28 percent, 10,000,000 in 50 percent, and one billion in 95 percent.
2. The severity of disease varied directly and the incubation period inversely with the size of the inoculum.
3. Chloramphenicol was superior to ampicillin in the treatment of those volunteers who became ill, reducing fever to normal in 3.5 days versus 6.0 days, respectively.
4. In exquisitely designed physiologic studies, Dr. Sheldon E. Greisman demonstrated that typhoidal illness could not be explained by the action of endotoxin alone.

The parenteral vaccines used by the British in South America were decidedly less efficacious in the immunologic virgins of the volunteer setting. Killed oral preparations, commercially available in Europe at the time, were completely ineffective in preventing disease, even when the vaccine was given in twice the recommended dosage. The most significant protection (87 percent) was afforded by a living attenuated vaccine (strain Ty21a) given by mouth in multiple doses. None of the vaccine recipients developed any side effects, nor did the vaccine ever revert to its virulent parent form. On the basis of the volunteer studies, field trials of the vaccine have been conducted in Egypt, Indonesia, and Chile. Results have been fair to excellent, dependent on dosage preparation and number. The vaccine has been available for several years for purchase in many countries, including most of western Europe, but not in the US.

This demonstration of an effective oral vaccine followed by 70 years the first recorded trial of another typhoid oral vaccine, also conducted by a Marylander. In 1904, Lieutenant James Carroll, English born, a graduate of the University of Maryland School of Medicine, and a deputy of Walter Reed in his famous Cuban studies of yellow fever, gave an ostensibly inactivated typhoid preparation to 13 US Army volunteers (including himself). Unfortunately, seven men contracted clinical typhoid, and three more were probable cases. The results were not made public until 1959,[8] and the oral approach lay fallow until the 1970s in Jessup.

Finally, earlier studies by Woodward and others had indicated in 1951 that high-dose, short-course corticosteroids, in concert with antibiotics, were effective in reducing the period of clinical toxemia without enhancing the likelihood of complications such as intestinal perforation or hemorrhage.[9] These studies were uncontrolled, however. It remained for Woodward to stimulate further investigation in the early 1980s by Hoffman and others in Jakarta, where typhoid is particularly virulent and where dexamethasone was shown significantly to reduce mortality in the gravely ill. [10] It is to these and similar studies of supportive care by many others that we may attribute the reduction in typhoid mortality (Figure 3).

Theodore Englar Woodward was born in 1914, raised in Westminster, Maryland, and received his early education there. His father and grandfather were both general practitioners, the latter having moved to Westminster from near what is present-day Wilmington, Delaware. The last of four sons, Dr. Woodward's eldest brother, Lewis K. Jr., was the medical director of the U.S. Department of State for 10 years.

A portion of Dr. Woodward's early years were spent on Meadowbrook Farm in Westminster. The first deed to the farmland was granted by Lord Charles, Proprietor of Maryland, in 1740. It was acquired by Dr. Woodward's ancestor, John Roop, in the late eighteenth century and is still producing crops for Carroll County. The farmhouse, originally built in 1805, has recently been restored and is registered by the Maryland Historical Society. It is said to have been the first home in Carroll County with indoor plumbing. The author currently lives there. ■

International Nutrition Research by a Maryland Physician

Chris Kjolhede MD, MPH

Dr. Kjolhede, a member of the Faculty of the Department of International Health, The Johns Hopkins University, has research and consulting experience in Indonesia, Mozambique, and Guatemala.

A major international nutrition project has lasted for almost three decades, primarily through the efforts of one Maryland scientist and pediatrician.

The arid, windswept, dusty, dilapidated, crowded shanty towns (*pueblos jovenes*) around Lima, Peru are as familiar to Professor George Graham as his present Maryland home. Dr. Graham is half Peruvian, fluent in Spanish, and knows the medicine, politics, economics, and culture of Peru. His interest and involvement in Peru has continued over the years from his home base in Maryland.

Receiving his MD from the University of Pennsylvania in 1945, Dr. Graham trained in pediatrics at the British-American Hospital in Lima, and at the University of Pennsylvania. He was Chief Resident in pediatrics at Baltimore City Hospital under Dr. Harold Harrison. He was Chief of Pediatrics at the British-American Hospital, Lima, for four years, worked at the Cleveland Clinic, and subsequently has been an attending pediatrician at the Baltimore City (FSK) Hospitals and Johns Hopkins. Dr. Graham has held academic appointments at the Schools of Public Health and Medicine of Johns Hopkins, MIT, and the Agrarian University, Lima, Peru.

Despite his demanding clinical duties, he saw opportunities for research and teaching in Lima and began to seek support for his ideas. He received National Institutes of Health (NIH) grant for research in malnutrition among Peruvian children. In initial research space provided by the Research Department of the British-American Hospital, investigations were carried out with Pan American Health Organization funding. Subsequent grants from NIH, UNICEF, and The Thrasher Foundation have been managed by Dr. Graham as Professor of International Health at Johns Hopkins.

The Instituto

The venue and the umbrella organization for the various nutrition investigations have changed over the years, but Dr. Graham has remained steadfast in his commitment to quality and germane nutrition research projects. Research activities were associated with the British-American Hospital from 1961 to 1971, when the

Insituto de Investigacion Nutricional became an independently functioning body while continuing to use space in the hospital. In 1982, the Instituto moved to its own facility on land donated by the government of Peru. This new facility had not only up-to-date laboratory space and equipment but also both out- and in-patient service areas. Adjacent to the grounds of the Instituto were the Peruvian Food Technology Institute, the International Potato Center (potatoes originated in Peru), and the Agrarian University. There has been a fruitful working relationship with all these institutions over the years.

Research Findings

The Instituto has been the source of numerous discoveries that had application in Peru as well as in other areas of the world where malnutrition is a problem. Early work concentrated on the design of treatment diets. The determination of the composition of numerous local foods[1,2] has been essential for designing local and regional nutritional intervention.[3-6]

It was at the Instituto that copper deficiency was first described in children recovering from severe malnutrition.[7] Lactase deficiency in children in severe states of malnutrition was described by Dr. Graham and co-workers from the Instituto.[8] The discovery of lactase deficiency in Peruvian children had important implications for the US government and relief agencies providing food aid for refugees and people during famines and disasters. The Biafran war famine prompted the Instituto's research team to develop a mixture composed of casein, cane sugar, and vegetable oil for the treatment of kwashiorkor among refugees.

Unconventional protein sources have been sought in an effort to design a diet both acceptable and available to those suffering from acute and chronic malnutrition.[9] The Instituto has pioneered clinical work on the difficult problem of availability of calories and proteins in various foods (similar to bioavailability) as contrasted to merely measuring calories and protein in the food.[10-12]

Training

The Instituto has been an avenue for the exchange of numerous students and residents. Two professors of Nutrition and two directors of research for leading US, nutrition corporations received their field experience at the Instituto. Nine Peruvians have found training positions or further education in the US, most here in Maryland. Some thirty American medical and undergraduate students and pediatric residents have had the opportunity to experience the ongoing activities at the Instituto. This level of collaboration continues with the support of Dr. Graham.

Dr. Graham's roles in the Instituto include senior researcher (Director of Research), senior clinician, author of grant applications, fund raiser, and President of the Board of Trustees. This involvement and commitment won him the AMA's prestigious Goldberger Award and made him "Maryland's ambassador for Human Nutrition to Peru."

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. And, choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package that is physician tested and approved. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500 form billing and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management

- ❒ menu driven
- ❒ on-line help manual
- ❒ maintains patient information
- ❒ insurance billing (1500 form)
- ❒ walk-out superbill
- ❒ end of month bill
- ❒ statistical reports
- ❒ accounting reports
- ❒ unlimited technical support
- ❒ unlimited software upgrades
- ❒ unlimited office staff training
- ❒ automatic back-up and restore
- ❒ separate ICD-9 and CPT code databases
- ❒ multiple diagnosis and procedure transactions
- ❒ password protection to sensitive areas
- ❒ no annual fee for Med Chi members

Call the Medical Solutions Management representative at (301) 539-0872 or toll-free in Maryland at 1-800-492-1056.

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

MERIDIAN

Statistics and Soap Operas: Population Dynamics at Hopkins

Winthrop Morgan MPH

The author is a Program Officer at The Johns Hopkins University/Population Communication Services in Baltimore.

What other School of Public Health can claim top-rate oogenesis lab, the first female director of a UN program, and a hit song on the top of the Mexican hit parade? Here's how the Population Dynamics Department at The Johns Hopkins School of Hygiene an Department has given new meaning to the term interdisciplinary collaboration.

Over the course of 30 years the Johns Hopkins School of Hygiene and Public Health, has developed its reputation as one of the world centers in research and professional training in population dynamics. Since its formation in 1964, the Department of Population Dynamics at the school has proved one of the most fertile resources for innovations and advances in the field. Faculty, students, and associates literally ring the globe. They teach, work, and provide technical assistance from Baltimore to Bangladesh.

The Interdisciplinary Approach: Joint Successes by Strange Bedfellows

Unique to Population Dynamics at The Johns Hopkins University (JHU) is its emphasis on an interdisciplinary approach to its field. Hopkins was the first to combine the resources of laboratory researchers with those of demographers and family planning program managers. Unlike most institutions, where biologists primarily are affiliated with the medical faculty and planners with management, Hopkins established a tradition of encouraging collaboration of an array of specialists under the same roof.

Twenty-one core faculty and almost 100 graduate students come from every continent and a wide breadth of experiences compose the Department. The three divisions of Reproductive Biology, Demography, and Reproductive Health and Family Planning Administration form the core of the Department. In addition, the JHU Center for Communication Programs, Johns Hopkins Program for International Education in Gynecology and Obstetrics, and Hopkins Population Center provide leadership in international family planning Information, Education, and Communication (IEC) research and development.

Because of its diverse resources and commitment to interdisciplinary interchange, it is not unusual to hear of projects such as "Tatiana and Johnny." In this project two Latin American teen singing stars performed a pop song with an underlying message to their peers: it's alright to delay sexual activity until you are older. Unlike most pop songs, the tune and lyrics were based on scientific

research by Hopkins associates to determine the best way to positively affect behaviors of Latin adolescents within the bounds of the culture. The joint effort of demographers, social scientists, and communication specialists resulted in the first public service message to hit the Top Ten of the Pop Charts in almost a dozen countries and generated enormous demand for information on family planning in these areas. Similar successful approaches are being used in Asia and Africa guided by Hopkins professors.

Researchers and professors have also been able to concentrate in their own disciplines. For example, population researcher Dr. John Kantner has pursued his surveys on the sexual behavior, contraceptive use, and pregnancy of young women in America over the past 20 years. His 1971 survey was the first of its kind; the insight it gave precipitated a national rethinking of family planning policy. Similarly, Dr. L.P. Chow, former director of Taiwan's family planning programs and professor at Hopkins for over two decades, teaches both in Baltimore and the Peoples Republic of China. In Reproductive Biology, Dr. Allen Schuetz continues his work in oogenesis and ovulation, while in Demography, Dr. Stan Becker experiments with village-level data collection procedures.

From Baltimore to Bangladesh: International and Domestic Applications of Population Dynamics

This singular marriage of the social, biological, and management sciences relating to human reproduction and population studies arose from the international work of pediatrician and Department founder Paul Harper in the 1950s and 60s, but the fruits of the experiment in collaboration have been applied abroad and at home .

Harper's international work in population planning fueled his determination to build the Department. During his travels in the Pacific Basin in the 1950s, he was impressed with the advances of his Asian colleagues in family planning program development. To share these experiences with students from around the world, he established a Visiting Professors program at Hopkins with the assistance of the Rockefeller Foundation. The tradition of maintaining the program as an international hub for a network of population specialists continues today; some of the original Visiting Professors regularly lecture graduate students in Baltimore.

The Visiting Professors program built links among the disciplines in Baltimore, but it was Harper's involvement in assisting the government of Pakistan with its population programs that provided the impetus to establish the Department. Harper saw how the Pakistan project provided an opportunity for researchers, professors, and students from a wide array of disciplines to collaborate on addressing the problem of the population explosion in an emerging nation. He and his colleagues became convinced that national population planning efforts were vital in emerging nations to cope with the problems of limited resources. They also were convinced that such efforts required a special kind of professional to run them. Leaders were needed who not only could handle administrative matters but also were trained in the biological and clinical aspects of population planning. Harper determined to establish a separate department of Population Dynamics to complement the Department of Maternal and Child Health he already had established, which could produce well-rounded professionals capable of participating in the design, administration, and monitoring all aspects of a national family planning program. Created in 1964, the interdisciplinary Division of Population Dynamics by 1970 had grown to Departmental status.

The training program of the Department produced exceptional planners, managers, and technical assistants. Dr. Nafis Sadik, Director of the United Nations Population Fund, and first woman appointed Director of a UN division, is a Hopkins graduate. Hundreds of other senior-level officers of population programs in developing and developed countries trace their professional roots back to Hopkins. And at the School, the faculty, students, and associates form one of the greatest concentrations of biologists, communication specialists, policy advisors, and managers working together to understand and help to meet the great population challenges facing the world.

Departmental work in international family planning programs is complemented by advances in domestic work, some of it applied to Baltimore. For example, while Drs. Paul Gray and Anouch Chahnazarian assist with demographic impact surveys in Haiti, Bangladesh, and Zaire, Dr. Constance Nathanson is examining the impact of sexually transmitted diseases and pregnancy in young adult clients of Baltimore's clinics. Dr. L.P. Chow is working on establishing the first School of Public Health in China and assisting with cost-effectiveness evaluations for Baltimore family planning initiatives. While Dr. Robert Kambic closely monitors Natural Family Planning projects in Africa, Dr. Laurie Zabin conducts research on the consequences of early abortion and childbearing on urban adolescents here at home.

Making "Soaps" and Obstetricians: Hopkins Affiliated Centers

Hopkins also maintains its tradition of applied research and development through the affiliated centers of the Department of Population Dynamics: the Center for Communication Programs, Program for International Education in Gynecology and Obstetrics, and the Population Center.

The *Center for Communication Programs* includes Population Communication Services (PCS), which provides assistance to health professionals in Africa, Asia, Latin America, and the Near East. PCS specializes in promoting family planning and health through

innovative applications of information, education, and communication techniques. They combine scientific research techniques with marketing talent to build awareness and understanding of various health issues and to promote positive behavior changes in targeted audiences. Calling on the talents of a wide range of academicians, commercial advertisers, and family planning specialists, PCS works to help governments transmit socially responsible health messages to their people in the most effective way. PCS operates with a budget of over $30 million from the USAID.

The unconventional successes of PCS have earned it a reputation as a maverick leader in the new fields of social marketing, enter-education (the use of entertainment channels to promote social messages), and cost recovery. The program excels in adapting commercially proved methods such as including promotional messages in dramatic entertainment, creating memorable images using sophisticated audio/visual techniques, and building campaign themes based on extensive audience research. For example:

- In Mexico, PCS helped develop a television soap opera that reached millions of women with messages about family planning. Enrollment of women in local family planning programs increased by one-third in the year following airing of the show. Additionally, contraceptive sales rose 23 percent, compared with only a 7 percent rise the previous year.
- In Nigeria, PCS helped develop a multimedia campaign involving posters, radio spots, and appearances of singing nurses at local markets to promote an expansion of family planning services in one region. During the next three years,the number of new acceptors of family planning increased from 258 per quarter to over 3,500 per quarter.

PCS and the Center for Communication Programs (CCP) regularly share their experiences with family planning professionals around the world. In the past few months, CCP has sponsored international seminars in Advances in Family Planning Communication and specific topics such as enter-education.

In addition to its work through PCS, the CCP keeps the public health community up to date on biomedical, demographic, and social issues related to population dynamics through its Population Information Program (PIP). PIP publishes a *Population Reports*, a bimonthly review of population and contraception-related issues, and maintains POPLINE, the world's only computerized bibliographic database covering both medical and social aspects of population.

The *Johns Hopkins Program for International Education in Gynecology and Obstetrics* (JHPIEGO) was established in 1974 with support from USAID to provide specialized education to physicians, nurses, midwives, administrators, and medical students in reproductive health care skills. Over 40,000 professionals from more than 120 countries have participated in JHPIEGO training seminars in Baltimore and its regional training centers in Africa, the Near East, Latin America, and Asia. The Program seeks to strengthen clinical skills, management capabilities of professionals; it also helps local governments institutionalize these courses in local training centers. JHPIEGO also offers equipment, training materials, and funding to support training activities throughout the world.

The *Hopkins Population Center*, a University consortium designed to support and promote interdisciplinary research and training in population studies, provides facilities and services to a diverse array of researchers to assist them in pursuing investigator-initiated programs. Facilities include a Data Processing Unit, an Information Unit, a Mathematical and Statistical Services Unit, and Electron Microscopy and Radioimmunoassay Units.

Future Plans

The Department of Population Dynamics initiatives reflect the intention of Chairman W. Henry Mosley to continue a tradition of interdisciplinary collaboration. With the Departments of Epidemiology and Environmental Health, a groundbreaking study of the reproductive risks among workers in the computer industry is under way. In collaboration with the Department of International Health, policy support is being provided to Nigeria as it develops a national family planning program. In addition, the Department is spearheading a schoolwide technical assistance effort as the government of the People's Republic of China prepares to open the first School of Public Health in China.

Summary

Since its inception in 1964, the Department of Population Dynamics has broken new ground in building interdisciplinary collaboration among the diverse fields of biological, social, and management sciences. The collaboration has produced uniquely well-prepared professionals, yielded some innovative research efforts, and advanced training and communication in the field of family planning. From Dr. Paul Harper's determination to build a center for sharing experiences in population planning, a world center for population dynamics has grown. ■

MRI UPDATE

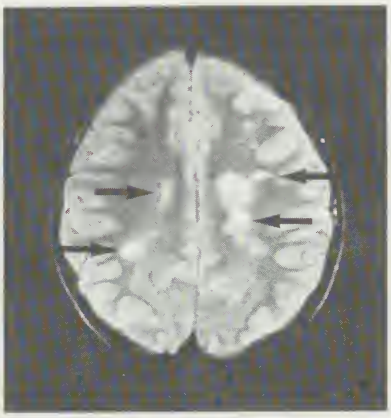

Figure 1

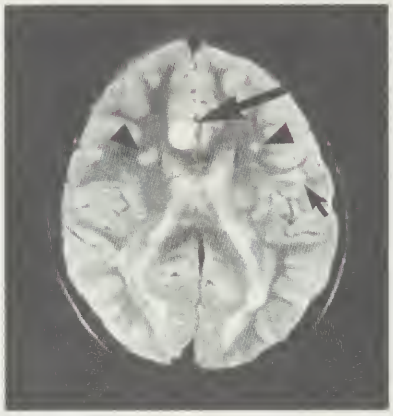

Figure 2

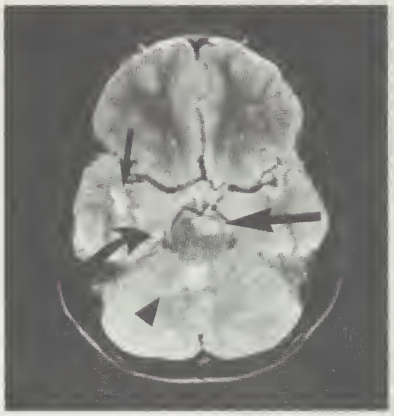

Figure 3

CLINICAL INFORMATION: Recently, there has been much discussion in the literature of the neurological symptoms caused by the spirochete borrelia burgborferi. The disease is transmitted by a tick bite and is associated with clinical symptoms of headaches, multiple arthralgias, and non-specific neurological symptoms. Given the appropriate clinical history, a diagnosis of Lyme disease can readily be confirmed by an MR scan.

FINDINGS: Figure 1 is a T2-weighted axial image through the brain. Abnormal focal areas of increased signal intensity can be identified within the centrum semiovale bilaterally (small arrows). These lesions are primarily located within the white matter but are of differing sizes. Figure 2 is also an axial image through the brain but at a level through the lateral ventricles. This section shows a lesion located within the medial gray matter of the right frontal lobe anterior to the corpus collosum (large arrow). Additional areas of abnormal increased signal intensity can be identified adjacent to the occipital horns, in the gray-white matter interface of the left parietal operculum (small arrow), and in the deep white matter of the frontal lobes in the region of the anterior corona radiata (arrowheads). Figure 3 is through the posterior fossa as well as the lower frontal and temporal lobes. Abnormal areas of increased signal intensity are demonstrated in the left anterior pons (large arrow) in the anterior right temporal lobe (small arrow), in the right cerebellar peduncle (arrowhead), and in the medial right temporal lobe (curved arrow).

The MR images clearly demonstrate the predominantly white matter involvement, multi-focal nature, and the absence of mass effect associated with these lesions. In the absence of clinical history, the MR appearance would be most consistent with a demyelinating process such as multiple sclerosis. However, as this case presented in a nine year old male following exposure to ticks, the differential diagnosis becomes that of Lyme disease. The diagnosis was further confirmed by the findings of similar, although less extensive lesions, in the patient's sibling.

COMMENT: The patient in the case above had a CT scan prior to the MR study which was negative. This case clearly demonstrates the increased sensitivity of MR over CT in detection of white matter processes. However, the case also demonstrates the relative non-specificity of the findings. In this case, the clinical history was most important in determining the true etiology of the patient's findings.

Battling Blindness Throughout the World: A Team of Scientists in Maryland Leads the Way

Jean H. Humphrey RD, MSPH and Alfred Sommer MD, MHSc

Here in Maryland an interdisciplinary team is combating the worldwide scourge of preventable blindness through clinical, epidemiologic, and laboratory research, training, and action programs.

Over 40 million people are blind today, 75 percent of these from preventable or curable causes. Many are unable to work, placing a heavy burden on themselves and others; most live in developing countries throughout the world. How are Maryland institutions helping solve this worldwide problem? The Johns Hopkins Dana Center for Preventive Ophthalmology is dedicated to preventing blindness throughout the world by the innovative application of public health methods and appropriate technology. The Center, directed by Dr. Alfred Sommer, has grown from an initial faculty and staff of 4 in 1980 to 48 by 1989. Clinical ophthalmologists, epidemiologists, biostatisticians, nutritionists, computer scientists, biochemists, and immunologists all work together in labs and offices in the Wilmer Eye Institute. The Center is a joint undertaking of The Johns Hopkins Schools of Medicine and of Hygiene and Public Health.

By the end of its first decade, the Center has contributed to combating the world's major causes of blindness by demonstrating the viability and value of a focused multidisciplinary approach to the problem and by using the ability to "leverage" interest by serving as a bridge between the worlds of clinical ophthalmology and public health. Examples of major contributions are

- Recognition of the importance of adequate vitamin A for the survival of young children,[1,2] and the demonstration that a public health program of ingestion of supplemental vitamin A can dramatically reduce the risk of eye disease and death.
- Documentation of the public health importance of ultraviolet light for the formation of cataract.[3]
- Demonstration of the value of ivermectin as the first safe drug for the treatment and control of onchocerciasis (river blindness).[4]
- Elucidation of the mechanisms underlying blinding trachoma and recognition that in some communities simple face-washing may provide the most practical means of control.[5]
- Development and application of new techniques for glaucoma screening including targeting of groups at particularly high risk of disease.[6]

- Initiation of the first postgraduate degree program in Public Health/Preventive Ophthalmology.

The Dana Center has been officially designated by the World Health Organization (WHO) as a Collaborating Center for the Prevention of Blindness, Xerophthalmia, and Onchocerciasis. The staff exchanges expertise and experience, plans strategy, and shares responsibility for specific programs with WHO, USAID, and other international agencies, private voluntary organizations; and other academic institutions.

Current Center activities span a wide range of ophthalmic and vision care problems: xerophthalmia, onchocerciasis, trachoma, cataract, and open-angle glaucoma are top priorities.

Xerophthalmia (Nutritional Blindness)

Xerophthalmia, from vitamin A deficiency, is the most common cause of preventable blindness in children. Each year there are five to ten million new cases, and up to a half million patients becoming blind.[7] Dietary deficiency of vitamin A often is exacerbated or precipitated by such illnesses as protein-energy malnutrition, diarrhea, respiratory disease, and measles. Vitamin A is essential for the formation of "visual purple" and for normal differentiation of mucosal membranes (which cover the eye, the respiratory and gastrointestinal tracts, and other epithelial tissues). Until recently, it was not recognized that "mild deficiency," characterized by night blindness and Bitot's spots, conferred any inherent risk for systemic disease. However, a longitudinal field study conducted by Dr. Sommer and Indonesian colleagues in Java[1] in the early 1980s revealed that children with mild xerophthalmia died at 4 to 12 times greater rates than did clinically normal children. This excess mortality risk appeared to be mediated through infection.[8] Mild xerophthalmia doubled the risk of respiratory and diarrheal infections, the two leading causes of preschool child death in developing countries throughout the world. These data indicated that mortality could be reduced 15 to 20 percent by controlling clinical xerophthalmia alone.

Following the longitudinal study, a randomized community-based controlled trial addressed the question of whether vitamin A supplementation could reduce mortality and morbidity in endemically deficient regions. Semiannual distribution of 200,000 IU vitamin A capsules reduced mortality in young children by 34 percent. This reduction was even greater than the impact predicted by controlling xerophthalmia alone, suggesting that even subclinical deficiency carries an excess risk of disease and death. Field studies have documented that vitamin A supplementation also improves growth and hematopoiesis.[9,10]

Measles remains a life-threatening disease for young children throughout the world and is known to result in rapid deterioration of vitamin A status. In a hospital-based study in Tanzania, oral vitamin A reduced measles-associated mortality by 50 percent.[11] This provided the basis for the WHO/UNICEF recommendation that measles patients routinely receive high doses of vitamin A.[12]

Current activities include a correlative clinical, laboratory, and treatment trial in Java examining the effect of vitamin A status and xerophthalmia on immune competence. Two randomized, controlled community trials of the impact of vitamin A prophylaxis on health and survival are under way in Nepal and Ethiopia to quantify health impact in these varied cultural and environmental settings.

Lessons learned in the developing world are carried home to Maryland. In Baltimore, a randomized controlled trial investigating the impact of vitamin A supplementation in preventing bronchopulmonary dysplasia

Onchoceriasis in blind adult led by child, who is in grave danger of becoming blind. Chad. (Photo A. Buck)

and retinopathy of prematurity among very low birthweight babies is being carried out in collaboration with The Johns Hopkins deapartment of neonatology.

Onchocerciasis (River Blindness)

Onchocerciasis is widespread throughout sub-Saharan Africa in both savanna and forest areas with smaller foci in South and Central America. It is especially common along rivers and streams. Worldwide 85 million people are exposed; 17 million infected, 1 to 2 million visually impaired, and 350 thousand irreversibly blind.

The disease is caused by infection with *Onchocerca volvulus*, which is transmitted by the bite of a black fly. Generally, infection occurs in childhood, and sight is lost during the productive years.

In the eye, the microfilariae cause blindness from either corneal scarring (sclerosing keratitis) or retinal destruction (chorioretinitis). The amount of blindness varies with the severity of infection and also with the geographic area; in the worst savanna areas, half of all adults older than 40 in a village can be blind. A new microfilaricide, ivermectin, is the first safe and effective treatment for this blinding scourge. Treatments need to be repeated annually until the majority of adult worms have died.

Under the direction of Dr. Hugh Taylor, the Center has taken the lead in the groundbreaking studies of ivermectin that led to its registration for human use in November 1987.[4]

Currently, the Center is assessing the long-term safety, compliance, and efficacy of mass distribution of ivermectin and its impact on transmission of infection by treating 14,000 people in Liberia. This study will provide the background information needed for large-scale distribution and demonstrate the feasibility of using ivermectin to control onchocerciasis on a community basis.

Trachoma

Trachoma is the most common infectious cause of blindness. In total 350 to 500 million people are affected and 5 to 10 million become blind from *Chlamydia trachomatis* infection. Trachoma as a blinding disease has almost disappeared in the United States and Western Europe, where it once was prevalent, as the standard of living has improved. However, trachoma remains a major problem in most developing areas where personal and family hygiene is poor.

Blindness rates are often higher in women, probably due to their continued exposure to infection during the child-rearing years. Although the early stages can be treated with common antibiotics, mass treatment campaigns have little sustained impact without changes in hygiene. Early degrees of trichiasis often can be reversed by surgery and so prevent blindness.

In large-scale epidemiologic studies in endemic areas in Africa and Central and South America, key components of personal and family hygiene (especially face washing) were identified that reduce the risk of trachoma. These discoveries opened the way for the development of effective public health interventions. Initial ethnographic studies in Tanzania have explored practices and constraints associated with face washing. The understanding of the linkage between water availability and face washing has led to community based health education interventions that are being tested for their efficacy in reducing trachoma.[5] In collaboration with WHO, a simplified trachoma grading system for field studies and use by primary health care workers was developed. Now in use worldwide, it has greatly enhanced field studies of trachoma.

To simplify and improve the surgery for trichiasis, a randomized controlled surgical trial is being undertaken in Oman. Different types of surgery are assessed for different stages of trichiasis. In the laboratory, a monkey model of trachoma developed by members of the Dana Center has demonstrated the biologic necessity of repeated episodes of infection to sustain the chronic destructive inflammation.[13] Further studies identified the key antigen responsible for initiating much of the disease process. Studies continue to determine how the individual responses of inflammatory cells in the conjunctiva lead to scarring and blindness.

Further studies in monkeys have identified a specific chlamydial antigen that induces a protective immune response, reducing subsequent eye disease.[14] Vaccines based on this antigen are being developed; in the future it may be possible to prevent the earliest stages of infection.

Cataract

Cataract causes more than half of all blindness in the world. Today, more than 20 million people worldwide are blind from cataract because fewer than 20 percent who require surgery receive it. Cataract is a particular problem for developing nations where it appears to occur about three times as often and 10 years earlier in life. Yet these countries are least equipped to provide needed surgical services.

Interest developed in international contexts has been applied here in Maryland. In a longitudinal evaluation of watermen living on the Eastern Shore of Maryland, ultraviolet-B (UV-B) radiation was shown to be an important risk factor for cataract.[3] This study also showed how the simple measures of wearing sunglasses and a hat protect the eye from UV-B exposure.

A large-scale, cross-sectional survey of subjects followed in the Baltimore Longitudinal Study of Aging will be analyzed to evaluate the role of medical and nutritional factors in the etiology of both cataract and macular degeneration.

Substantial advances in cataract surgical techniques in recent years have resulted in a dramatic increase in the number of cataract extractions done in the United States. Currently, more than one million operations

are performed each year at tremendous cost to patients, government, and health insurers. Despite these important advances, there remains wide variation in the surgical procedures used as well as in the type and intensity of surrounding medical services. Faculty of the Dana Center in collaboration with health service researchers from a wide variety of departments at Johns Hopkins are examining the sources and reasons for the current variations in cataract surgical practice and are in the process of identifying a set of recommended cataract management guidelines that can serve as reliable quality-of-care indicators for practice pattern evaluation.

Open-angle Glaucoma

Open-angle glaucoma is a leading cause of blindness affecting 1 to 6 percent of adults worldwide. It is particularly prevalent and severe among blacks, in whom optic-nerve damage occurs earlier and progresses faster. This racial difference has major implications for Baltimore.

Research at the Dana Center has focused first on identifying risk factors amenable to intervention or that could be targeted for screening and education.

A second priority has been the development of new methods for visualizing the nerve fiber layer (NFL).[6] By defining normal variation, and developing a new approach to the interpretation of threshold perimetry (cross-meridional comparison), a practical and reliable means has been created for distinguishing between normal subjects and patients with early glaucomatous field loss.

Follow-up of two large populations of glaucoma patients and suspects will establish the validity and value of these new and improved techniques.

Training

The Dana Center has a strong commitment to the training of new leadership for blindness prevention programs at national and international levels. The Center provides a master's degree program as well as a formal postdoctoral fellowship program.

Reverse Foreign Aid : The Foreign Medical Graduate

Timothy D. Baker MD

Dr. Baker is a professor at the School of Public Health and Hygiene, The Johns Hopkins University, Baltimore.

Maryland has received a great gift of dedicated hard-working FMGs whose basic education was underwritten by other countries. It is time we considered ways to return the gift.

Every year for the past 18 years the State of Maryland has received the equivalent of almost $25 million in "reverse foreign aid" primarily from the poor countries of the world. This reverse foreign aid is in the form of 2,200 new foreign medical graduates (FMGs) who have taken up the practice of medicine in Maryland. Since 1970, 75 percent of these physicians received their basic medical training in the less-developed countries (LDCs) of the world, but they will serve the citizens of Maryland through their careers.

The cost of US education for a replacement for one of these physicians is modestly estimated at $200,000. Thus, the replacement costs for the 122 FMGs/year (2,200/18 yr.) would come to $25 million.

What does the State of Maryland do for the countries that provided so much training for these physicians? Really very little. Maryland's share of the cost of US foreign aid health programs is very small in comparison to Maryland's benefits received from the services of these well-trained, conscientious FMGs mostly from the less-developed countries of the world. Maryland has approximately 2 percent of the US population. The annual foreign aid health budget is approximately $260 million; Maryland's share may be estimated at $5.6 million. An appreciable amount of the US foreign aid health money is spent in Maryland. The number of US pysicians trained in Maryland who are working full time in foreign countries is less than 1 percent of the number of FMGs working in Maryland. What is true of Maryland receiving "reverse foreign aid" in the form of FMGs is true of the other states in the United States.[1]

Distribution of FMGs in Maryland

In the United States, over 20 percent of all nonfederal physicians are foreign medical graduates. In Maryland, we have received even greater benefits from the less-developed countries of the world, as almost 30 percent of our Maryland physicians are FMGs. There is a general misconception that FMGs tend to go into hospitals in large cities rather than practicing in communities in the US. The evidence shows that only one-fourth of FMGs work in hospitals,

the same percentage as US medical graduates. (The overall US percentages are the same as Maryland.)

In Maryland, only 3 percent of FMGs work for the federal government, while 9 percent of US medical graduates are federal physicians. For the US, 4 percent of all MDs work for the federal government. The higher percentage is due to the NIH and other large federal physician employers located in Maryland.

Thus, the majority of FMGs are providing direct service to the citizens of Maryland.[2]

Countries of Origin

There has been considerable change in the countries that are major contributors to Maryland's FMG resource. In 1970 there were 72 countries whose graduates were practicing in Maryland. Many of these countries had less than 10 graduates. The 15 larger contributors (over 50 graduates) are shown in the Table 1.

The majority (82 percent) of all of Maryland's FMGs in 1970 were engaged in patient care. At that time, almost twice as many were in hospital-based as in office-based practice. FMG house staff considerably outnumbered full-time FMG hospital staff, a marked contrast to the situation today in Maryland. Less than 10 percent of all FMGs at that time were engaged in research. Of those engaged in research, over 10 percent were from Japan. (Over 33 percent of all Japanese FMGs in the United States are located in Maryland.)

There was an "open door" policy for the immigration of FMGs until 1976 when preference status for physician immigrants was withdrawn. In the early 1980s the number of available residency places also declined. In 1970, 30 percent of FMGs were house staff. This percent has declined considerably.

In 1986 (the most recent year for which published FMG information is available for Maryland), one finds a quite different picture. Almost twice as many FMGs are in office practice as in hospital-based practice and the full-time hospital staff outnumber the residents and interns. This shift reflects the markedly decreased number of hospital training positions for FMGs today.

Table 1. Countries Providing Maryland with over 50 Doctors in 1970 [3]

Argentina	59	Japan	53	Switzerland	60
Cuba	113	Peru	65	Thailand	74
India	129	Philippines	385	Turkey	57
Iran	115	South Korea	108	United Kingdom	69
Italy	56	Spain	74	West Germany	105

Table 2. Countries providing Maryland with Over 75 doctors by 1988[5]

India	756	Lebanon	112	Thailand	91
Iran	200	Mexico	225	Turkey	78
Ireland	88	Pakistan	121	UAR	73
Italy	87	Philippines	562	Korea	197
Taiwan	76				

There is also a new phenomenon since 1970: US born FMGs trained in "offshore" medical schools in Grenada, Mexico, the Dominican Republic, etc. However, in 1986 they still made up only 8 percent of all FMGs in Maryland.[4]

While there were 15 countries who had given Maryland more than 50 FMGs in 1970, the number of countries providing over 50 FMGs doubled (28) by 1988. The countries with over 75 FMGs is presented in Table 2. Comparison with Table 1 shows that the doctors from less-developed counties play an even more important role than in 1970.

What might be done to redress the injustice of poor countries paying for the basic training of doctors who serve the people of Maryland?

Foreign Medical Graduates Who Return Home

If the Graduate Medical Education National Advisory Council (GEMENAC) projections of oversupply of doctors in most clinical fields is correct, Maryland will not have permanent places for new FMGs in the future. The number of residency slots in Maryland has decreased, and it is extraordinarily difficult for an FMG to be accepted. Could not clinical training programs be designed to give advanced training to FMGs and insure their return to the countries that supported their basic education? A study of "J-1 (exchange visitor) Visa" physicians shows that the majority of those trained in public health and preventive medicine in Maryland return to their homes.

In Maryland, for example, The Johns Hopkins University School of Public Health, the first graduate school of public health in this country, has over 70 years of experience in the education of FMGs. In 1921 the first graduating class had two US citizens and two Brazilians. (One of the Brazilians was one of the two physicians credited with founding the World Health Organization.)

A few vignettes of the many School of Public Health trained FMGs who returned home show that advanced training in Maryland **can** benefit the FMGs home countries.

Dr. Sushila Nayar (MPH 1949, DrPH 1950) had been Mahatma Gandhi's personal physician before coming to the United States. On her return to India she was made the Director of Health in Delhi state. In the late 1950s she was appointed Minister of Health for India. On leaving government service she founded a medical school to train doctors to serve the rural poor of India.

Dr. Abdul Zahir (MPH 1955) returned to Afghanistan and served as Minister of Health. He later became Ambassador to Pakistan and to Germany. (Physicians from countries where medicine offers one of the few opportunities to obtain higher education occasionally move into high political positions.) There has been no contact with Dr. Zahir since the Russian invasion of Afghanistan.

Dr. Luis Carlos Gonzales (MPH 1947, DrPH 1948) returned to Venezuela to lead that country's program for malaria eradication. He later served as Minister of Health. When he left Venezuela, he continued work with the Pan American Health Organization. Just before his death, Dr. Gonzales made a Spanish translation of the General Professional Education of Physicians (GPEP) report.[6] The task force preparing this report was chaired by a Maryland educator, Dr. Steven Mueller.

Dr. Volvick Joseph (MPH 1975) was appointed Minister of Health of Haiti. (The past "President for Life" of Haiti, Dr. Duvalier, was an FMG and had public health training in the US but not in Maryland!)

Dr. Zohair Sebai, born in Mecca and educated in Cairo, came to Hopkins in 1965. His training pattern points up the importance of appropriate training to insure the return of FMGs. As is the practice at The School of Public Health, Dr. Sebai was urged to return home to carry out research attuned to the problems and conditions in his own country. He worked in the remote oasis village of Turaba (see photo), under faculty supervision, then returned to the US for analysis of his data. He returned to Arabia to work in the Ministry of Public Health. He was appointed Chairman of the Department of Community Health, University of Riyadh. Then he served as Dean of the newest medical school in Saudi Arabia in Abha, Asir Province.

Many FMGs who have attended the School of Public Health have assisted their own countries in an indirect manner by service with The World Health Organization or the United Nations' agencies. Examples include: Dr. Marcolino Candau, Brazil, a Director-General of WHO; Dr. Leo Kaprio, Finland, Director-General European Region WHO; Dr. Jo Asvall, Norway, current Director-General European Region WHO; Francisco Dy, Philippines, Director-General Western Pacific Region WHO; Dr. Abraham Horwitz, Chile, Director-General of The Pan American Health Organization and American Region of WHO; and Dr. Nafis Sadik, Pakistan, Director of the United Nations Fund for Population Activities.

Zohair Sebai leads research team in rural Saudia Arabia. (Sebai)

Are the difficulties of FMGs returning to their own countries all because of inappropriate training in the United States? Certainly not. Many of the difficulties are due to cumbersome bureaucracies and prejudices against the FMG who secured education in the United States. The problems of appropriate planning for affordable utilization of doctors in poor countries is a part of the problem of international "brain drain." [7,8] However, it is beyond the scope of this article.

The example of FMGs studying preventive medicine in Maryland and then making major contributions to their own countries and to international agencies shows that at least in one field Maryland training programs make it possible for foreign physicians to receive training in the US and then return home.[9]

Could other specialties do the same? The AMA, American Board of Medical Specialties, Associate of American Medical Colleges, American Hospital Association, Council of Medical Specialty Societies, and the Educational Commission on FMGs have proposed an *International Medical Scholars Program, Inc.* to accomplish the goal of appropriate training in the United States and the return home of new FMGs.[10] The FMGs from Cayatono Heredia Medical School in Peru have formed an association and collected funds for projects in their school and in Peru. Should FMGs from other countries also take steps to help the countries that trained them?

Maryland has received a great gift of dedicated hard-working FMGs whose basic education was underwritten by other countries. It is time we considered ways to return the gift.

Acknowledgment

Thanks to Dr. Mary Ann Eiler, Department of Physician Data Sources AMA for a special analysis of current Maryland data and to Dr. Samuel Asper, former president ECFMG, for their suggestions. This article may not reflect their views or the opinions of their organizations.

Geographic Epidemiology

Alfred A. Buck MD

Dr. Buck is professor in Immunology and Infectious Disease and International Health, The Johns Hopkins University.

Information on health problems of people in rural areas of developing countries is scarce; national health statistics are limited due to a lack of adequate diagnostic facilities and incomplete disease reporting. Generalizations from isolated observations to larger areas are fallacious because they neglect the focal nature of most endemic diseases.

The Geographic Epidemiology Unit (GEU) of The Johns Hopkins University was established in 1964 and continued its work with a full team until 1972. Its major goals were in-depth studies of endemic diseases and other local health conditions in ecologically contrasting areas of Peru, Chad, and Afghanistan by a multidisciplinary team of medical and nonmedical experts. The specific aims included:

1. Determination of distribution and frequency of specified diseases and health conditions
2. Identification and quantification of disease determinants including behavioral, entomologic, and environmental factors
3. Comparative analyses of disease patterns and of their interrelationships
4. Systematic validation studies of diagnostic methods and screening tests in communities with different disease spectra

The Team

The GEU had two epidemiologists, an anthropologist, a sanitary engineer and entomologist, two public health nurses, two laboratory scientists, and technicians. Additional team members included a veterinarian in Peru and ophthalmologists in Chad and Afghanistan. Whenever special investigations were indicated to follow-up on unexpected findings, other specialists were recruited. Over time specialists in urology, dermatology, pathology, internal medicine, leprosy, human genetics, malaria, radiology, bacteriology, and human genetics have joined the GEU. The permanent field team was supported by base laboratories at The Johns Hopkins Medical Institutions in parasitology, serology, bacteriology, blood chemistry, and hematology. The Department of Radiology developed and evaluated all chest radiographs taken in the field. The Department of Biostatistics carried out processing of integrated data and assisted in the statistical analyses.

The Countries

The criteria for final selection of Peru, Chad, and Afghanistan for the study included the degree of commitment and cooperation

of the Ministry of Health of the host country in the study, availability of local manpower, security of the team while working in remote areas without access to public services, and the range and diversity of disease problems. The communities finally selected for study were as follows. In Peru, San Antonio, a jungle village at the bank of the Rio Maranon where the Amazon River begins; Cachicoto in the transandean upper jungle region, at the banks of the Monzon River at 2,400 feet altitude; Yacango, an arid zone village at 6,150 feet altitude; and the Andean village of Pusi above Lake Titicaca at 11,800 feet altitude.

In Chad, these communities were chosen: Djimtilo at the Chari River Bank where it empties into Lake Chad, inhabited by the Arab Salamat tribe; Ouli Bangala, located in the forested savanna zone near the borders to Cameroon and the Central African Republic populated by members of the Laka tribe; Ouarai, a village not indicated on the official map of Chad, located in the central southern-most area of the country inhabited by Sara tribesmen; Boum Khebir, a remote village accessible by dirt road for only four months of the year, located at the banks of Lake Iro in South East Chad with residents of the Goula tribe; and Faya, a major oasis in the heart of the Sahara desert, with a population composed of Anakaza and Kamadja tribesmen.

Table. Endemic Infections of Public Health Importance in Villages of Peru, Chad, Afghanistan

Disease or Infection	CHAD 1	2	3	4	5	PERU 1	2	3	4	Afghanistan 1	2	3	4	Diagnostic Criteria
Malaria	+	+	+	+		+					+	+		Parasitemia Clinical DX
Chagas						+		+						Clinical Serological
Leishmaniasis			+	+			+				+	+		Clinical dx
Toxoplasma gondii	?	?	?	?	?	+	+	+	+	+	+	+	+	1HA Test > 1:64
Wuchereria bancrofti		+	+											Microfilaremia
Loa loa		+	+	+										Microfilaremia
Tetrapetalonema perstans		+	+	+										Microfilaremia
Onchocercosis		+												skin biopsy and clinical DX
Schistosomiasis mansoni		+												Eggs in stool
Schistosomiasis hematobium	+	+	+		+									Eggs in urine
Fasciolidae								+		+		+		Eggs in stool
Echinococcus granulosus										+	+	+	+	IHA >1:60
Hookworm		+	+	+		+	+							Eggs in stool
Strongyloides stercoralis		+	+				+							Larvae in stool
Ascaris lumbricoides						+	+		+	+	+	+	+	Eggs in stool
Trichuris trichiura						+	+		+					Eggs in stool
Taenia saginata			+		+				+	+				Eggs & proglotids
Hymenolopis nana							+				+	+	+	Eggs in stool
Entamoeba histolytica	+	+	+	+	+	+	+		+	+	+	+	+	Cysts in stool
Balantitium coli						+	+		+					Parasite in stool
Histoplasma capsulatum or duboisi				+			+							Skin & CF tests chest x-ray
Treponematoses														
Syphilis	+	+	+		+		+		+		+		+	FTAabs,VDRL &
Yaws				+										TP1 test,
pinta							+							clinical DX
bejel	+				+								+	
Gonorrhea	+													Clinical DX Bacteriologic

Leprosy		+	+	+		+							+	clinical & micros
Trachoma	+				+						+		+	Clinic & micros
Epidemic typhus	+						+	+	+	+	+	+	+	CF test
Murine typhus	+	+	+							+	+	+	+	CF test
Tick-borne typhus	+	+	+											CF test
Q-Fever		+			+	+		+	+	+	+	+	+	CF test
Number of locally important public health problems	3	5	2	3	1	2	5	1	2	3	2	1	5	
Number of endemic infections in village	10	16	14	9	7	7	1	13	6	10	12	11	13	

The wide ethnic and ecologic diversity of Afghanistan was represented by the following communities: Sayedabad, a village of Moghuls, at 5700 feet altitude in the valley of the Bamyan River of the Hindukush Mountains; Bulla Quchi, an Uzbek community, located in Qunduz Province 30 miles south of the border with the USSR; Gawargin, a new settlement of relocated Pushtuns in the large irrigation scheme of the Helmand River valley in South West Afghanistan; and Karokh, in the North Western Province of Herat, inhabited by Tajiks with a large sub-group of Sayeds who claim direct descent from the Prophet, located at an altitude of 5,400 feet at the spur of the Paropamisus Mountains.

The Investigations

Throughout the study a nucleus of standardized measurements including interviews, physical examinations, laboratory and skin tests was used, regardless of whether a particular disease was present in the community. This practice made it possible to determine the relative sensitivity and specificity of the epidemiologic tests in different settings. For important diseases with a restricted regional distributions (for example, onchocerciasis and chagas' disease) appropriate diagnostic tests were added to the standard study protocol of the country as indicated. The similarities and differences in the disease patterns found in the 13 villages of the three countries are depicted in the Table. Not included in the table are common diseases of usually short duration (for example, diarrhea, ARI, skin infections, and asymptomatic infectious states determined by serologic tests for a battery of arthropod-borne virus infections).

In each village a complete house-to-house census was carried out first. The average village census was 355 persons with 32 percent less than 10 years old. All houses and families were numbered and a village map was prepared on which each house was identified. The high rate of participation in the different test procedures in all villages was achieved by offering treatment to all persons in the samples who were sick (Photo 1). The average rates of participation were physician exam 95 percent, stool exam 88 percent, urine 92 percent, and blood 91 percent. To avoid bias from clandestine increases of the original family sizes by nonresidents who sought treatment by pretending a family relationship, free medical services also were offered to persons not included in the study population. The exact laboratory methods, physical examination protocols, health interviews, environmental measurements, and entomologic methods were described elsewhere.[1-3] In each village data for more than 150 variables per person were collected routinely by the physicians and

scientists who had no prior knowledge of the results of measurements carried out by other team members.

Modern Techniques

Many recent technical advances were utilized by the GEU to increase the efficiency of epidemiologic studies in remote areas, that is, major improvements in air transportation, camping equipment and facilities for work in remote areas; facilities and methods for the safe collection, preservation, and shipment of blood, serum and other sensitive biologic specimens, including liquid nitrogen freezers; microtests for rapid diagnosis under rugged field conditions; use of light-weight portable x-ray and ultrasound units; and the availability of computers for the processing and epidemiologic analysis of complex data collections (Photo 2).

Logistics

The usually difficult logistic problems were solved in a detailed pilot study carried out jointly by the epidemiologist, sanitary engineer, and anthropologist of the JHU team together with team members of each host country assigned by the Ministry of Health. Excellent cooperation with the local power structure was achieved after careful consideration of the cultural features and other local peculiarities of each community.

During the pilot studies the exact location of each camping area was chosen with help from the village council. The water supply of the 18-member field team was selected from a nearby river, stream, lake, or well. The water had to be transferred to a system of lyster bags for treatment. During the 18 months of field work no health problems were encountered due to unsafe water supply. The water system was developed by the sanitary engineer of the GEU.[4] Cultural taboos for collecting venous and finger blood samples, stool and urine specimens, for conducting physical examinations of women and children, and for carrying out health interviews were identified and overcome.

Contractual arrangements were made for in-country transport of the approximately 5,600 lbs of camping and research equipment by road, air, or river. The most reliable means of shipment for sensitive specimens, infective material (bacterial cultures, arthropods, human tissue, etc.), and exposed x-ray film from the field to Baltimore was determined by first sending dummy specimens using different routings. IATA regulations, licenses for transit and import of these specimens were obtained and, if necessary, modified for items not yet included in official regulation manuals. Similar preparations had to be made for the regular supplies of liquid nitrogen, corrosive and other dangerous materials, medications, and sensitive biological reagents. An unexpected difficulty was encountered regarding the supply of specific snake antivenoms for exposed team members and snake-bite victims in Chad where reliable data on the species and distribution of poisonous snakes were unavailable. The dearth of this information led us to include a special category for "poisonous animals" in the study protocol.

Accomplishments

The accomplishments of the GEU covered a wide range. First, there was the care and treatment provided by the medical members of the team for the length of their stay in a village. In all the communities visited the treatment of chronic disease (that is, tuberculosis, leprosy, trachoma, etc.) was also begun, provided that

Photo 1. The team did not merely measure disease - they treated all sick persons identified (JHU photo).

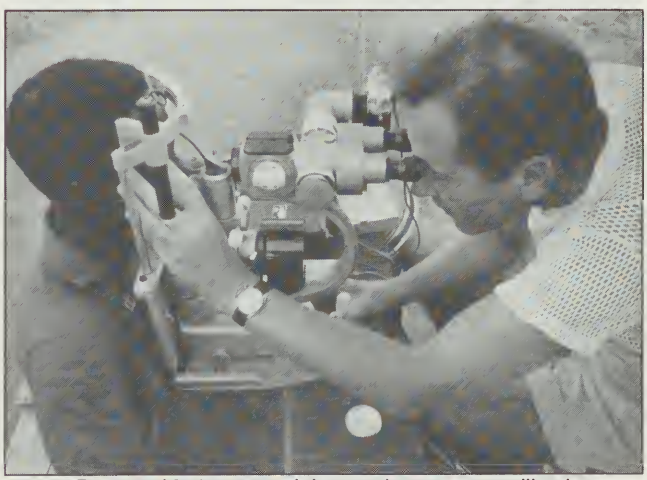

Photo 2. Modern examining equipment was utilized under primitive field conditions (JHU photo).

reliable arrangement for its continuation could be made with local officials. Sufficient supplies of drugs were either left with responsible villagers or sent via reliable routes of communications. The medical services provided by the team included medical emergencies caused by accidents, assistance in complicated deliveries, minor surgery, medical treatment, as well as referral and transport of severely ill patients to the distant hospital of the provinces and districts.

Second, new information was provided on existing community health problems that were unknown at that time to the Ministry of Health. This included findings of foci of endemic treponematoses pinta in Peru and endemic syphilis in Afghanistan, of serious trachoma in Chad and Afghanistan, of a high prevalence of toxoplasmosis in Peru, of severe hookworm anemia in a coca-growing area of the Montana of Peru, as well as outbreaks of acute diseases in villages of all three countries.

Third, was the comprehensive and detailed study report of diseases and health conditions in the different villages that were carefully selected by the health officials to represent significant ecological subdivisions of the country.

Photo 3. Coco chewer with limited life span due to chronic low-dose cocaine ingestion in Peru (JHU photo).

Fourth, new findings requiring follow-up study concerned quite different subjects. A new hemoglobin phenotype, consequently called Hemoglobin Tchad was identified in the women of an Anakaza family in the Sahara.[5] In the same country a new salmonella serotype was isolated from routinely grown cultures of slow and nonlactose fermenting enterobacteriae from rectal swabs of children, named *Salmonella baiboukoum*[6] after the seat of the subprefecture in which the infection was found.

In Afghanistan, using clues from the results of serum electrophoresis, biochemical follow-up studies led to the identification and characterization of two new serum albumin variants (Albumin Afghanistan and Albumin Pushtun) in ten members of four families of Pushtuns.[7] In this village there was also a high frequency of glucose-6-phosphate dehydrogenase deficiency (22.6 percent) in man, as compared to 4 to 5 percent found in the other Afghan villages.[3] Also in Afghanistan, 10 percent of the residents of the Moghul village of Bamyan (with a history of frequent intermarriages between relatives) had an anatomic variant of the limbal area of the eye in which the sharp transition of conjunctival to corneal epithelium was lacking. Many of the people with this pseudopannus previously were diagnosed as having trachoma. Another genetic abnormality was the presence of Hemoglobin Punjab in the Uzbek village of Bulla Quchi.[3]

The severe effect of heavy habitual coca leaf chewing on the health status of plantation workers was studied in the village of Cachicoto. In this part of the Peruvian jungle area, coca has been grown for decades (Photo 3). A study comparing the "coqueros" of Cachicoto with control subjects matched for age, sex, and ethnicity revealed severe anemia, with large and significant differences in hemoglobin and hematocrit levels when adjusted for intensity of the endemic hookworm infections.[8,9]

In Chad, the unexpected finding of microfilariae of *Onchocerca volvulus* in urine samples of a sizable proportion of villagers led to a clinical follow-up study of the pathogenesis of generalized onchocerciasis.[10,11] Subsequent studies of this unusual manifestation were carried out by members of the JHU team in Guatemala and Cameroon.[12-14]

The role of the frequently encountered anticomplementary activity of sera from tropical Africa was studied in relation to serum protein levels, anergy to skin tests and multiple infections.[15]

Because patent concomitant infections with different parasites were found frequently in most of the villages studied, follow-up investigations of the nature and health impact of polyparasitism were conducted.[16-19]

Ticks collected by the entomologist of the team in Chad and Afghanistan were made available to Dr. Harry Hoogstral for his collection and for identification.[2,3] Snakes collected by the team in Chad were

subsequently identified as the saharan sand viper, saw-scaled viper, night adder, and two nonpoisonous species. From discussions with scientists of the Laboratoire de Recherches Veterinaires de Farcha and the director of the Service Des Grandes Endemies in N'djamena we learned that three genera of poisonous snakes are present in Chad: *Bitis, Echis,* and *Naja*. In the Sahara oasis of Faya there where serious, sometimes fatal reactions after people were stung by scorpions of the species *Androctonus amoureuxi*. Attempts are under way by the Institute Pasteur to develop specific antivenoms.

During our studies in Afghanistan it became apparent from the examination of blood slides and the age-specific patterns of malaria antibodies that the malaria eradication program of the country was failing in an area south of the Amu Darya (Oxus) River. Indeed, one year later, there was a serious epidemic of *Plasmodium vivax* malaria. Members of the GEU accompanied by Dr. Ronald Ward of the Walter Reed Army Institute of Research were invited to investigate the outbreak.[3]

New Wines from Old Bottles

The original study protocols included provisions for the storage of aliquots of serum specimens from the field at -85° F. This material made it possible to study the relative association between specific infections and health conditions identified in the studies of Chadian villages and the occurrence of false biological reactions in the screening tests for HIV infections. The Figure shows the frequency distribution of optical density readings in the combined Elisa test for HIV 1 and 2[20] as applied to preserved sera of three Chadian villages. Further studies are under way.

Conclusions

In the developing countries of the tropics, concomitant infections are the rule rather than the exception. In medically underserved areas, when it is impossible to identify the causes of diseases through appropriate clinical and laboratory examinations, the etiologically unlabeled illness goes unreported and is left in the cesspool of diagnostic anonymity. This lack of information is particularly marked for chronic infections and conditions with insidious onset and obscure pathognomonic signs and symptoms even after they become clinically apparent and cause chronic disability.

One observation in the study of the rural communities by the GEU was the high frequency of chronic disability in younger age-groups.[21] In some of our villages the rates among teenagers and young adults were three times higher than those found in comparative age groups of Americans.[22] The etiology of the often preventable conditions is usually obscured by a combination of secondary causes and complications such as malnutrition, accidents, and genetic malformations.

Figure. Percent Distribution of Elisa Results

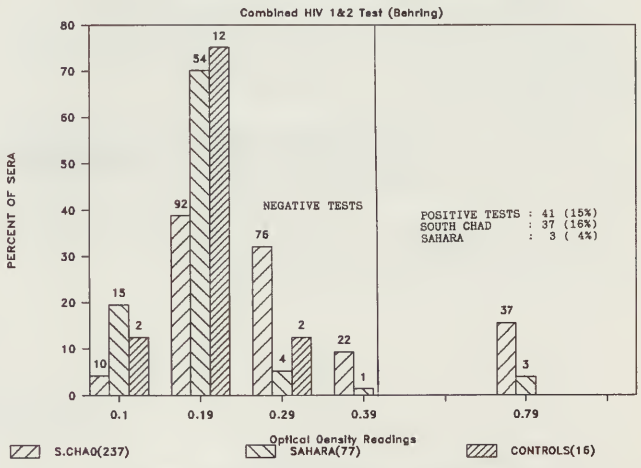

Figure. Percent Distribution of Elisa Results

A few well-planned in-depth studies of health and disease in ecologically and culturally significant subdivisions of a country, supplemented for population coverage by rapid epidemiologic assessments of selected health problems in more communities may be the method of choice to gather the essential data needed to develop a sound health strategy for disease control in medically unexplored areas.

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

MARYLAND DIAGNOSTIC IMAGING CENTER

7120 Contee Road
Laurel, Maryland 20707

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

Health Care of Merchant Seamen

John B. MacGibbon MD

Dr. MacGibbon is an Instructor in Medicine, The Johns Hopkins Medical School. He also is affiliated with Union Memorial and Church Hospital.

The Port of Baltimore has almost 3,000 ship arrivals every year from over 50 countries. Almost 70,000 merchant seamen from throughout the world enter the port.

To what diseases are seamen liable? In 1713 Bernardo Ramazzini wrote in his *De Morbis Artificum* (Diseases of Workers)

> Of all the arts that contribute greatly to the happiness of mankind ... navigation contributes most...the good things Nature has made peculiar to this or that country navigation has made common to all.... Let us now consider...to what maladies sailors are liable.... It often happens that ships are attacked by some epidemical disease which...may arise from the presence on board of a great crowd of seafarers of various and diverse sorts...the seed of contagion spreads aboard, and the rest fall victim to the same disease. In such a case there is no escape, for they are all in the same boat as the saying is.... They suffer from irritating infections of all over the body caused by impurities that collect in the skin and the quarters in which they live give them no chance to attend to personal cleanliness... and for this reason they are beset by a monstrous host of lice.[1]

In the hot, dry August of 1819, bonfires lit the smoky night skies in an attempt to purify the air of the Port of Baltimore's Fells Point area of the yellow fever plague. There were 640 cases with 240 deaths reported to the local health authority.[2]

Since those days the Port of Baltimore has extended from Fells Point to include Sparrows Point, Dundalk, the Inner Harbor, Clinton Street, Canton, Port Covington, Locust Point,Fairfield, Wagner's Point, Curtis Bay (Coast Guard Station), and Hawkins Point (the old quarantine station area). It is to this vast waterfront that seamen from all over the globe arrive and spread out into the neighborhoods and the city in search of recreation and business. It is to this city that they could bring contagion and sometimes take away locally acquired diseases.

Historical Data on Seamen's Problems

A few statistics and vignettes of the situation earlier in this century can be gathered from the British Board of Trade publications and other sources.

British Mercantile Marine Mortality in 1926 was 889 out of a total of 159,950 seafarers (a very high death rate for men in the younger and middle years of life). All diseases accounted for 410

deaths. For death with known cause: enteritis 28, smallpox 7, malaria 13, TB in all forms 41, pneumonia 63, cardiovascular disease 56, suicides 30, alcohol-related deaths 31, other 141. Injuries accounted for more than half of all deaths (448).

In 1931, 133 cases of malaria were landed in the UK vessels; and 432 cases occurred during the voyages. In 1930 on one ship there were 12 cases of malaria and one death on the homeward voyage. In 1931, 33 cases of smallpox were reported prior to arrival.

In 1926 the League of Nations reported that tuberculosis was responsible for 9.1 percent of all causes of sickness in French seamen, 16 percent in Italian seamen, and 10.1 percent in German seamen. J.E. Wood stated that deaths among seamen from respiratory tuberculosis comprised 9.5 percent of all deaths. Of deaths within a year of leaving the sea 20 percent were due to tuberculosis.[3]

Yellow fever was also a problem. In September 1936 the *S.S. Sea Rambler* arrived in the River Tyne having left Dakar in West Africa in August. Of the original crew of 24, 7 were dead and 5 were left in hospital in Madiera. Despite illness, two stayed on duty. These men were diagnosed as having food poisoning in Funchal but were later discovered to have yellow fever. The ship was fumigated on arrival in the River Tyne. No mosquitoes were found.

The Population Served

In 1988 the Baltimore Maritime Exchange reported 2,761 ship arrivals. There were 610 bulk ships, 410 container ships, 439 general cargo ships, 22 chemical tankers, 7 cement carriers, and 39 refrigerated cargo ships. Over 50 nations were represented. Over 100 ships under each of the flags of the following countries arrived: America, Denmark, Greece, Panama, United Kingdom, and West Germany. The average crew numbers 25, thus almost 70,000 seamen arrive in the Port.

The captain notifies the agent when there are sick on board. Arrangements are made to bring patients (we hope with an interpreter) to the hospital, doctor, or dentist. Occasionally it is necessary for the doctor to board the ship at the dockside, or in the stream by launch or helicopter, to screen for those who need to come ashore for treatment. Previously seamen were taken to the United States Public Health Hospital for communicable disease and were denied shore leave. Now with the abolition of crew inspection such cases are treated by local facilities.

Quarantine in the Port of Baltimore

Gone are the days when the Quarantine Station sent officers to board each foreign arrival to inspect the crews for contagious diseases. Because of the number of arrivals, improved communications, and improved sanitation on board ships this practice was replaced by a "free pratique" obtained by the master by radio. He made a declaration of his recent itinerary and reported any fevers, illnesses, or deaths occurring during the 15 days preceding arrival, including any seamen who had disembarked or been removed. Cases of diarrhea on ships carrying passengers must be reported directly by radio to the quarantine station. Health Declarations are no longer required. Now the captain must report any death or "ill person" on board while the ship is in a US port. (An ill person means one who has a temperature of 38° C or greater accompanied by a rash, glandular swelling, or jaundice, or which has persisted for more than 48 hours or has diarrhea of 3 of more loose stools.) Some illnesses under Quarantine Regulations may go unreported, however.

Medical Care for Seamen in Baltimore

Foreign seamen in Baltimore are taken care of by private physicians or clinics. Some physicians are appointed by the public health authority or Seamen's Directorate of the nation under whose flag the ship sails. Other arrangements are made through the owners and their local agents or through the local legal representative of the international health accident insurance groups or clubs. In countries with socialized or partly socialized medical programs for workers such as in Italy, Britain, and Scandinavia, medical payments are handled through insurance agencies and the national health insurance plans.

Billing for Medical Services for foreign seamen is a tortuous procedure. Bills are sent to the local agent for the shipping company who is not responsible for the payment but forwards the bills to the owners overseas. In turn, they submit bills to their insurance agent for payment to the owner who (it is hoped) remits it to the local Baltimore agent who finally reimburses the provider. The local agent may be supplied with cash advances to take care of port expenses, but this cash advance almost never is sufficient to cover hospitalization. Because of the high cost of medical care in the US, a great effort is made to avoid hospitalization by repatriating persons by air to their home country for care. While air evacuation to Europe may be acceptable, it is less so when repatriation is to be made to a third-world nation. Often the compensation for permanent total or partial disability for third-world seamen is inadequate.

Changing Factors Influencing Seamen's Health

The health of seamen has greatly improved due to (1) better conditions of employment and (2) employment screening, especially for European ships.

Conditions of employment of seamen have improved greatly in the past 50 years. The days of shanghaiing drunks in port neighborhoods, such as Fells Point, and putting them aboard ship have long gone. Now the conditions of employment are dictated by agreements between ship owners and unions. The qualifications for sea service are laid down by regulation in many countries. These standards, especially on

Scandinavian ships, are regularly updated by government agencies. However, for "flags of convenience" of third-world countries there may be few safeguards and crews' conditions of service and wages are often less satisfactory. Costs of medical care in a foreign port may not be covered if the illness results from a seaman's misconduct, as in contracting venereal disease.

Standards vary widely for preemployment examination. Employment agencies in less-developed countries may require only the sketchiest of examinations and are open to bribes from applicants, who may even send a substitute for the examination. Many large multinational corporations owning ships under flags of convenience also have strict standards for employment. Many companies require chest x-rays, stool and blood examinations, and in the Middle East applicants often are screened for bilharzia urinary infections. Drug screening is routine only on US ships.

The health of seaman is usually quite good, with the exception of poorly screened crews coming from countries where the general standard of health is low. However, even healthy populations have illnesses as may be seen in the following section on one practice in Baltimore that serves merchant seamen.

Analysis of a Practice Serving Seamen in Baltimore

In a local practice, in 1,000 consecutive visits in the past year (1988) the breakdown of primary symptomatology or the principal diagnostic category precipitating the visit is as follows:

	Percent
Injuries	12.0 [a]
Respiratory	5.9
Cardiovascular	4.5 [b]
Gastrointestinal (incl parasites)	14.0 [c]
Genitourinary	3.0
Sexually transmitted diseases	7.0
Musculoskeletal complaints	12.5
Endocrine	3.0
Nervous system (incl Psychiatric and alcoholism)	5.5
Eye complaints	7.6
ENT complaints	7.9
Dermatological	16.0
Other conditions (incl malaria)	1.1

a. Half were wrist or hand injuries
b. 80% were for hypertension
c. 27% were due to peptic ulcer disease diagnosed here or formerly by x-ray

Conditions of Particular Interest

Injuries There are dangers from the holds and cargoes. Diminution of oxygen may occur from absorption or by increase in carbon dioxide from growing substances.There may be qualitative changes due to fumes from cargoes of petroleum products, asphalt and other chemicals, from the combustion and decombustion of such cargoes as grains, coal, undressed skins, latex, etc. *W.F.R.Essed* reported a case of suffocation in a ship's hold from moldy latex producing excessive build-up of carbon dioxide and diminishing the oxygen supply. Special care is needed in ventilating cargoes with plant consignments such as grains and fodder and cargoes of damp coal and coke. Ventilation is needed for motors, furnaces, and welding activities in enclosed spaces.

There is constant source of injury from the machinery, ship's gear, and engines. With deck crews the most common hazard is falling (down hatches, off beams, down ladders) due to the motion of the ship. Other common injuries are from moving machinery, tackle, cargo swinging at the end of a derrick, and from objects falling from above.

Respiratory Bronchitis, asthma are much as ashore. Seamen are often very heavy smokers due to the tax free status of cigarettes, the long hours of boredom and the promotion on board by the tobacco companies.

Gastrointestinal In 30 years only a rare outbreak of epidemic diarrheal illness has been encountered. One episode of ciguatera poisoning involved the crew of the *M.S. Charon* with the exception of the radio officer. The captain had caught some amberjack. They were cleaned, gutted, put in the reefer, then cooked and eaten by everyone except the radio officer. A few hours later all the others came down with varying degrees of nausea, vomiting, abdominal pain, diarrhea, and later with neurological complaints of pains in the limbs, dysthesias, numbness of the lips and tongue, and altered temperature sensation. By the time the ship reached Baltimore most of the gastrointestinal symptoms had subsided but some of the neurological symptoms remained. More than a month later crew members still reported neurological symptoms aggravated by the ingestion of alcohol.

Ciguatoxin is a heat stable toxin occuring in fresh otherwise untainted fish resulting from the consumption by the fish of a dinoflagellate organism. It is the most commonly reported fish poisoning throughout the world.[4]

Parasitic disease is not uncommon in seamen from tropical countries. One patient from India was admitted to a Baltimore hospital because of subacute obstruction and a mass in the left lower quadrant. He was scheduled for bowel surgery on the assumption that he had an obstructing carcinoma. The surgery was averted with the finding of amoebae in the colonic biopsy specimen. There was resolution of the amoeboma with treatment. Amoebic liver abscesses have occasionally been seen and treated. Frequent parasites recovered have been ascaris, strongyloides, oxyuris, trichuris, hookworm, giardia, clonorchis sinensis, amoebae, and tape worms.

Most of the stools were examined because of gastrointestinal complaints or the findings of an eosinophilia. Because of the short time the ships now remain in port, a few hours instead of days, routine stool examination is not practical.

Genitourinary The most common serious genitourinary complaint in the engine room crew is renal colic

due to calculus possibly caused by inadequate hydration and the high ambient temperature in the engine room, which may reach 40-45°C.

Sexually transmitted disease The spectrum of disease has changed markedly. Twenty years ago one would see five to eight crew members from one ship with acute gonorrheal symptoms, often souvenirs from Caribbean and South American ports. Now with national health authorities and some companies having protocols of treatment that can be carried out on board, there are less. Much of the lessened incidence is due to better education, less time in port, shorter contracts enabling crew members to return home to their families after four to six months instead of two years. There has been an increase in the number of married crew members and crew members who are relatively affluent. Many send money home to support extended families. This seems to have added to the increase in social stability of seamen. The fear of AIDS has contributed to the greater use of condoms. AIDS testing in Baltimore poses problems due to the short time in port and required informed consent from persons who understand very little English.

Nervous system including psychiatric and alcoholism Drug addiction and drug taking has in my opinion been little or no problem with the foreign seamen arriving in the port of Baltimore. Alcoholism seems less of a problem than it used to be for reasons stated earlier: a more socially stable population, more home ties, shorter contracts, better wages and working conditions, and better preemployment screening.

Emotional factors are of great importance. Difficulty in interpersonal relationships in the constricted environment of the ship can assume serious proportions and often the only way to escape them is to visit the doctor in the hope of being taken off the ship and flown home unfit for sea duty. In the case of problems at home this device may be used to obtain free repatriation. This practice may be aided by the captain and leads to either spurious or exaggerated symptoms being presented to the doctor.

Eye complaints The chief eye complaints are those resulting from corneal foreign bodies while chipping rust and paint. Lack of or not using eye protection is the major cause of this this.

Dermatological This comprises the largest group of complaints. Many are superficial fungus infections with tinea versicolor being the most frequent. Acne and furunculosis and hidradenitis suppurativa are common bacterial infections. Miliaria and other heat-related conditions are common. Frostbite is occasionally seen in the winter months. Solar skin changes are seen in North European patients. In the steward's department and among laundrymen and engine room workers contact dermatitis is quite frequent and at times severe enough to need repatriation or change of job.

Leprosy was seen on an Indian ship. The diagnosis was made by fellow crew members. The patient was hospitalized here at Wyman Park.

Other conditions, including malaria Malaria has been encountered quite frequently. Often it has been treated on board with cloroquin by officers who recognize the symptoms. Acute episodes of nonfalciparum malaria can be safely treated on board this way. Nonimmune crew members who either have not taken prophylaxis correctly and have contracted a resistant or nonresistant strain of *P. falciparum* are in grave danger. Deterioration can occur very rapidly, and death may ensue. Hospitalization is needed and appropriate treatment must be initiated promptly. Treatment in the intensive care unit is needed if complications arise. In circumstances where the laboratory is unfamiliar with the interpretation of thick and thin smears, empiric treatment should be started if suspicion is high, even if the initial smears appear negative. I have had wonderful help and cooperation from the staff at the Maryland State Health Department Laboratories in the rapid screening, identification, and confirmation of malarial smears.

In the United Kingdom, where about 400 to 700 cases of P. falciparum malaria are diagnosed yearly, from 1983 to 1988 from 4 to 8 deaths occured yearly.

Treatment at Sea

Medical help at sea by radio communication in the native language is available from appointed hospitals in the ship's home country They are familiar with the equipment carried, the contents of the medicine chests, and the contents of the ship's medical manuals issued to help the officer in charge of first aid to the crew.

Ships under flags of convenience may have to call a nearby coast guard or a passenger ship for help unless they have subscribed to one of the systems that provide comprehensive medical services to people in remote places. Such a system is Medical Advisory Systems (MAS) that has its headquarters in Owings, Maryland.

MAS provides 24-hour consultative services by radio, telex, or telephone by experienced physicians whose comunication is facilitated by the use of detailed protocol manuals. Training of designated personel to deliver reasonable on-site care to ill or injured coworkers and to keep extensive computerized medical histories of each participating employee also is provided. MAS directs a network of facilities around the world to provide specialized physical examinations and to monitor the appropriateness and cost effectiveness of hospital and private physician care. They also insure, through a maritime insurance company, qualified employee and dependent groups against illness, disability, and death. Through a subsidiary laboratory company they will provide customers with repackaged medications and supplies and provide forecasting and inventory data.

Need for Social Support for Seamen in Baltimore

All the foregoing attends to the physical care of the seaman in port. There is great need for a seamen's center (such as there is in Rotterdam) where crew

members can meet, send letters, make telephone calls, and arrange trips and sporting events. The Scandinavians formerly had seamen's centers in Baltimore. The Norwegians still have such a service run by a local representative of the Seamen's Church.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.
Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

Soon more than a million.

Soon more than a million insulin users will be taking Humulin.

And no wonder. Humulin is identical to the insulin produced by the human pancreas—except that it is made by rDNA technology.

Humulin is not derived from animal pancreases. So it contains none of the animal-source pancreatic impurities that may contribute to insulin allergies or immunogenicity.

The clinical significance of insulin antibodies in the complications of diabetes is uncertain at this time. However, high antibody titers have been shown to decrease the small amounts of endogenous insulin secretion some insulin users still have. The lower immunogenicity of Humulin has been shown to result in lower insulin antibody titers; thus, Humulin may help to prolong endogenous insulin production in some patients.

Any change of insulin should be made cautiously and only under medical supervision. Changes in refinement, purity, strength, brand (manufacturer), type (regular, NPH, Lente®, etc), species/source (beef, pork, beef-pork, or human), and/or method of manufacture (recombinant DNA versus animal-source insulin) may result in the need for a change in dosage.

DIET...EXERCISE...

Humulin®
human insulin
(recombinant DNA origin)

The George Washington University
WASHINGTON DC

Medicine in the 1990's, are you ready? Are you looking for new career challenges? George Washington University's Master of Public Health program serves the needs of clinicians entering a new era in medicine — an era in which skills in epidemiology-preventive medicine, administrative medicine, and occupational-environmental health are important for professional development. Set at the crossroads of academic clinical medicine, a major university, and the public health community of Washington, the program offers part- and full-time programs with weekday evening and Saturday morning classes.

Maryland's Travelers' Clinics

R.B. Sack MD, D. Herrington MD, and T. Baker MD

Dr. Sack is Director of Geographic Medicine and professor in International Health at the Johns Hopkins School of Hygiene and Pubiic Health. Dr. Herrington is assistant professor of medicine at the University of Maryland School of Medicine. Dr. Baker a professor at The Johns Hopkins School of Hygiene and Public Health.

Almost half a million Marylanders travel outside the United States every year[1] and are subjected to disease and injury hazards not generally encountered in this country.

Approximately 5,000 Americans die overseas every year, and many more are injured or fall ill. It is not generally recognized that injuries are the leading cause of lost years of productive life of Americans overseas.[2,3] How can Maryland physicians best advise their patients planning to travel, particularly to the less-developed countries of the world, if they are not familiar with the conditions their patients may encounter?

The need for medical care for foreign travelers has led to the development of the specialty of Travel Medicine (emporiatrics) with national and international associations and journals. In Maryland the needs of travelers led to the establishment of five special travelers' clinics designed to advise travelers about the needed immunizations, prophylactic medications, and preventive practices to help insure their travels are disease and injury free. The clinics known to us are the International Travel Clinic at Johns Hopkins, The University of Maryland Geographic Medicine Travelers' Health Service, the Mercy Medical Center International Travelers' Service, the Wyman Park Travelers' Clinic, and the Harbor Health System Clinic.

International Travel Clinic at Johns Hopkins, 550 North Broadway, Room 107, Baltimore: 8 a.m. - 5 p.m., Tuesday, Wednesday, Friday. Appointments can be made Monday - Friday by calling 301-955-8931. Parking available.

One of the largest travelers' clinics in Baltimore, the Hopkins Clinic has a complete range of services specializing in preventing diseases that commonly (and uncommonly) plague travelers to the developing world. The clinic was begun by physicians and nurses at Hopkins who continue to have personal experience living and working extensively with the diseases in less-developed countries.

The clinic provides individualized pretrip consultations, including current health information and advice, immunizations, and medications appropriate to the area to be visited. Posttrip consult-

ations are available for persons who develop illnesses during and following their travel. The clinic staff can serve as medical consultants for businesses, diplomatic organizations, and others engaged in extensive travel abroad.

The clinic offers a selection of vaccines not commonly found in most physicians' offices: vaccines against yellow fever, diphtheria, tetanus, polio, typhoid, cholera, meningococcal meningitis, rabies, hepatitis B, and immune globulin for the prevention of hepatitis A. For those traveling to areas where malaria is a risk, appropriate antimalarial medications are prescribed. Medications for the prevention and/or treatment of diarrheal diseases (including the dispensing of packets of oral rehydration salts) are recommended.

The Clinic is continually updated on disease problems occurring throughout the world and on vaccine requirements through the Centers for Disease Control, Atlanta; the World Health Organization, Geneva; and from their own personal contacts.

Clinic fees vary, based on the number of vaccinations needed and consultation time required. Most insurance companies **do not** cover these expenses.

The University of Maryland Travelers' Health Service, Faculty Practice Offices in the University of Maryland Professional Building at the corner of Paca and Redwood Streets in downtown Baltimore. To schedule appointments, call from 8 a.m. - 5 p.m. Monday - Friday 301-328-5196. For emergencies, nights, and weekends dial the on-call answering service, 301-328-5717. Free parking: University Plaza Garage, Redwood and Greene Streets.

This service provides comprehensive health care for travelers in tropical and subtropical countries. The Geographic Medicine faculty are internists and pediatricians with special training and experience in tropical medicine. Each is a highly knowledgeable clinician engaged in research to improve health conditions for international travelers.

Pretravel Recommendations: immunizations: yellow fever, cholera, typhoid, meningococcal meningitis, Hepatitis B, rabies, tetanus, diphtheria, and polio vaccines and immune globulin

- prevention and treatment of diarrhea
- prevention of malaria, including necessary drugs
- education about other disease risks and where to obtain medical advice while traveling

After-travel Health Care:

- evaluation of fever, diarrhea, or other acquired illness
- routine checkups, including examination for parasites

International Traveler's Service at Mercy Medical Center, 301 St. Paul Place, Baltimore. For further information call 301-332-9770. The Center publishes a quarterly guide for travelers, *Mercy Passport*.

Wyman Park Travelers' Clinic, 3100 Wyman Park Drive, Baltimore: 1 - 4 p.m., Tuesday. Call for appointments 301-338-3376. The clinic is at the site of the USPHS Hospital.

CMC, Inc., 16 South Eutaw Street, Baltimore. This clinic, a subsidiary of the Harbor Health System Corp., offers immunizations including yellow fever shots. For further information call 301-752-3010.

There are travelers' clinics in the Washington, DC area, such as the clinics run by Dr. Martin Wolf, former Director of the State Department Medical Program.

If there are other travelers' clinics in Maryland the authors would be pleased to learn about them.

American Practitioners and the Global Primary Care Movement

Henry G. Taylor MD and Carl E. Taylor MD, DrPH

Dr. Henry G. Taylor is an internist with the Pendleton (County, West Virginia) Community Care. Dr. Carl E. Taylor is Professor and Chairman Emeritus of International Health, Johns Hopkins University. He is also a Past Director of UNICEF for China and father of Henry G. Taylor.

Experimental Community-Oriented Primary Care (COPC) demonstrations are beginning to show how innovative concepts from around the world can help evolve a distinctly American health system adapted to the particular needs of each community.

In the past decade the worldwide primary health-care movement has drastically changed the way that most poor countries of the world are trying to organize their health services. US physicians have paid little attention to the health-care innovations that have occurred in other countries. An awareness of international experiences may help American practitioners and others involved in the United States' health system as they try to meet current challenges such as providing equitable coverage within the constraints of the growing need for cost containment. New experimental Community Oriented Primary Care demonstrations in the US[1] are beginning to show how innovative concepts from around the world can help evolve a distinctly American health system adapted to the particular needs of each community.

In the US, primary (or first contact) care gradually evolved over many years into what was mainly a screening process designed to get sick patients to hospitals where they would get definitive but extremely expensive care. Those providing primary care may have had a different perception of their role, but the priorities of financing of health care were clearly on hospitals. As one general practitioner says, American medicine today is characterized by "spending beyond our means."

The international primary health care movement is based on the premise that health care can and must be made more cost-effective by concentrating first on procedures that are applied in the home, the community, and the peripheral (primary) health facility. Early care and changes in health habits have the potential to produce lasting benefits. They increase both the individual's self-reliance and the community's competence for solving their own health problems.

If health promotion and primary care are given priority, hospitals can assume a supportive role, caring only for those patients really requiring referral. Biomedical research has led to costly and technologically sophisticated experts who perform complex procedures. Insurance plans have financed this trend. We need more

research directed at simplifying care, reducing costs, and increasing access.

Evolution of the International Primary Health-Care Movement

The first use of the term "primary care" we can find in the literature is in an *Interim Report on the Future Provision of Medical and Allied Services* by Lord Dawson of Penn to His Majesty's Government in 1920.[2]

In the early 1930s, Dr. John Grant and Dr. C. C. Chen of the Peking Union Medical College applied Lord Dawson of Penn's concepts to a field situation. They organized a total preventive and curative health care program for the 100,000 people in TingHsien County, China, at a cost of ten cents per person per year (1930 US exchange rates).[3] In each village, young men and women were trained as community health workers and midwives to provide simple care to their neighbors. This demonstration was expanded by Mao Tse Tung into the barefoot doctor movement that brought effective health care to almost one quarter of the world's population.

In 1980, the health status of Washington County, Maryland, and a rural county outside Shanghai were compared by the Johns Hopkins Department of International Health, the US Center for Disease Control, and the Shanghai First School of Public Health.[4] Morbidity patterns, mortality rates, and other health indices were essentially the same. The one dramatic difference was in cost. Average per capita cost for total health care was over $1,400 per year in Washington County and about $15 per year in Shanghai County. (The average income level in Washington County was less than 30 times that of Shanghai County; the medical costs were almost 100 times as great!) The main reason was the difference between income levels of American specialists and Chinese barefoot doctors. It is chastening to realize that the Chinese were able to achieve essentially equivalent health status with so little that we consider essential.

John Grant's primary care principles were applied to rural villages in India over a ten year period by the Johns Hopkins Department of International Health.[5] Using well-trained Family Health Workers and modern clinical protocols, it was possible to provide comprehensive child care for less than $5 per person per year. Groups of villages in the experiment reduced perinatal, infant, and childhood mortality rates 45 percent when compared over a three-year period with controls. Average weight of three-year-old children increased by one pound, and height increased by two centimeters. Psychomotor tests improved significantly and the practice of family planning tripled. Many other projects around the world have demonstrated similar results.[6]

The global primary health care movement officially began in 1978 at the Alma Ata World Conference on Primary Health Care sponsored by the World Health Organization and UNICEF.[7] Most countries have moved toward increasingly specialized and expensive institutions that are available mainly to the elite. In developing countries the sharp differences between those who can and cannot afford modern health care were so evident that efforts to promote equity through primary care became politically important. Leaders found they had to act to meet the expectations they had created for free health care. Leading health officials from more than 140 countries made national commitments to turn their health systems around, shifting the focus from tertiary to primary care. Following through with these commitments takes a long time, but there has been a corresponding shift in the health budgets of many countries. At the World Health Assembly, countries brag less about hospital beds and medical schools and more about primary health centers and village health workers.

The three pillars of primary health care defined at Alma Ata are:

1. Developing **effective peripheral (primary) health services** using methods, staffing patterns and financing acceptable and affordable at the local level.
2. **Community participation** that increases the capacity of people to solve many of their own health problems.
3. **Intersectoral cooperation** recognizing and promoting contributions from education, women's rights, transportation, and other development activities.

The first euphoria for primary health care faded in the 1980s when it proved difficult on a national scale to replicate the rapid results of demonstration projects. Attention temporarily shifted away from building basic health infrastructures to first developing and delivering specific targeted services, especially EPI (Expanded Program for Immunization) and ORT (Oral Rehydration Therapy). It is estimated by WHO that the deaths of over two million children are being averted by EPI and ORT, out of the 14 million preventable deaths annually of children in developing countries.

The intent was that these special activities should eventually become part of primary health care. Subsequent research has shown that they indeed are most successful when there is an established health infrastructure. WHO efforts are being directed at establishing a more effective system of primary care in all countries; thus the current WHO slogan "Health for All by the Year 2000."

COPC in the US

Efforts to apply the principles of John Grant and Primary Health Care in the US context have centered since 1982 on the concept of Community Oriented Primary Care, as articulated by Kark & Abramson and others.[1,3,8-10] The COPC process aims to move beyond the individual patient to their sociodemographic social

group or a larger geographic community. The COPC process mimics clinical care, but on a larger scale. There are:

1. a defined population	(the patient)
2. a health system	(the practitioner)
3. community perceived needs	(the chief complaint)
4. epidemiologic diagnosis	(the history & physical)
5. interventions	(the treatment plan)
6. monitoring efforts	(diagnostic testing)
7. modification of 1 - 5	(follow-up visits)

Pendleton Community Care (PCC) is applying the principles of COPC to a sparsely populated, rural mountainous county in eastern West Virginia. Developed with minimal outside support, it is controlled by a community board elected by a local membership. Pendleton Community Care combines an acute care clinic, a prepaid membership program, and diverse projects responding to expressed needs of the communities it serves.

The four health providers (internist, pediatrician and two family nurse practitioners) are each involved in all three program areas. Eighty-five percent of their time goes into the 9,000 acute care visits, which are paid on a fee-for-service basis. Membership programs, supported by an annual membership fee of $10 per person per year, emphasize health education and preventive care for 17 percent of county households. Community projects include a Drug Free Communities Program, a teenage pregnancy reduction program, support services for caregivers to the elderly, facilitating community response to a disastrous flood, a car seat rental program, and an ongoing community diagnosis and monitoring program.

In organizing Pendleton Community Care, the health professionals stated their interest in the "denominator population" of 8,000 Pendleton County residents. Individual patients had free choice to use services or see other physicians in the area. Making a commitment to learn about the special qualities and concerns of a defined group of people fundamentally changes the orientation of health professionals. New areas of expertise develop, clinical reading has relevance for community problems, and providers become aware of social and cultural factors affecting health. It also becomes possible to work through the social dynamics to change root causes of ill health. Furthermore, those in greatest need may not be the ones who come into the office. We may need to reach out to them in special ways.

Health professionals need to listen carefully to the community. This takes concentrated time and effort. Initially, it occurred through informal socializing. Now more direct methods such as surveys, epidemiologic analysis, and focus group interviews are being used.

Defining and mutually prioritizing the health problems of the county blends epidemiologic techniques with community participation. Billing slips from the clinic combine demographic data, diagnostic information, and financial information, helping to reflect morbidity patterns. Systematic monitoring of a successful program of care to the elderly, for example, will improve program effectiveness by allowing us to concentrate on what has worked best in our own situation.

Feedback of relevant findings from the entire COPC process produces a dynamic process of change. This parallels a rural community itself in transition.

Why US Practitioners Should Consider the COPC Approach

Physicians are involving a more assertive public in their practices. The general cultural trend toward individual rights and self-determination is amplified by lawsuits regarding informed consent. Instead of the confrontation feared by all, the search for solutions should be based on cooperation, especially in each community. This is not only good "risk management" but also "social marketing."[11]

Corporate conglomerates have become a major force in the health care marketplace, with personal care tending to get lost in the process.[12] We are being told to deliver the most effective care to the most people at the least cost. How can we do that while still maintaining loyalty to the individual patient?[13] Many US primary care physicians believe they could serve their patients better if they only had one government bureaucracy to deal with rather than four or five corporate bureaucracies.[14] We do not need more evidence that health care does not respond to the usual market mechanisms.

To sustain the gains in life expectancy achieved over the last 50 years, major changes in health behavior will be required. Changes in individual perceptions, beliefs, and risk behaviors are sustained by social and community support mechanisms.[15-18] The national coordination of the Hypertension and Cholesterol programs provides a good example of these theories in action. Health providers can help best with lifestyle change when they combine education with primary care.[19,20] In a sense, this is the ultimate privitization of public health.

A focus on a particular "target" population in the community can energize the tired clinician to escape the narrow confines of the office walls. Much of the public fondness for the "good old country doctor" lies in their recollection of a relationship that transcended technicalities. Through COPC various institutional structures (ranging from advisory committees, governing boards, memberships, or even community service projects by the doctor) can reestablish that collaborative relationship. We all need the give and take of personal contact embodied in Dr. Peabody's famous words, "the secret of the care of the patient is in caring for the patient."[21]

Summary

In conclusion, comparative studies of primary health care in various parts of the world can lead to new

solutions for underserved communities in Maryland and other parts of the US. Careful review of how similar principles work under different circumstances will open new approaches. Current international experience shows that each country must evolve its own health care system. We have much to learn from those who are poorer than we, where limited resources stimulate local innovation and less waste.

Selecting Appropriate Malpractice Coverage
Can Result in Substantial Savings
For Your Medical Group

CALL US AND COMPARE

MEDICAL LIABILITY AGENCY, INC.
SERVING MARYLAND'S LEADING
MEDICAL GROUP PRACTICES
(301) 296 8326

PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $7 million for individual doctors and $13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

Quality Assurance and the Treatment of Hypertension

Marcel E. Salive MD, MPH

Quality assurance has been applied to inpatient services for over 15 years, yet only recently have these review activities begun to be extended to an ambulatory setting. In the near future, peer review organizations (PROs) and private firms will begin to review the quality of outpatient surgery and office-based medical care provided to Medicare beneficiaries. The many differences between inpatient and outpatient quality assurance make it difficult to predict the impact of these developments.[1] The prevalence of hypertension has made it a natural subject for many of the early research reports on ambulatory quality assurance. We review these reports as a basis for predicting the changes in patient care that may result from the new PRO involvement in outpatient care.

Quality and Quality Assurance

Donabedian developed a widely accepted system for assessing the quality of care based on the measurement of structure, process, and outcome of care.[2] Quality assurance extends the measurement of quality by acting to correct any adverse findings. Structural evaluation of medical care quality, which deals with provider qualifications, administrative organization, and facilities, is exemplified by Flexner's evaluation of medical schools and subsequent activities of the Joint Commission on Accreditation of Hospitals in certifying hospitals.

The process of care, which refers to the way care is delivered to patients, is generally compared to the standards as developed by experts or local physician peers. Process evaluation developed and has flourished in response to legislative initiatives related to the Medicare and Medicaid programs. The organizations that conduct process evaluations have been known over the years as Experimental Medical Care Review Organizations (EMCROs), Professional Standards Review Organizations (PSROs), and PROs.[3]

While the EMCROs were research-oriented, PSROs and PROs main goals were to save money by decreasing inappropriate or unnecessary hospital-based care. Although the criteria the PROs use were developed carefully, some of the parameters or indicators of quality made little sense to clinicians and have been called "laundry lists." One criticism of process criteria is that they may increase care delivery costs but do not affect the health outcome.[4] Differences in physician practice by specialty, among patient populations, and among regions have worked to thwart attempts to develop a valid and generalizable set of rules for patient management. Nevertheless, the American Medical Association together with the Rand Corporation recently have announced plans to develop "practice parameters."

Although outcome-based measures of quality of care have been developed in terms of mortality, morbidity, and quality of life, few are available for use in ambulatory settings. Outcome standards make intuitive sense as desired end results of care, but they may be limited by an imprecise relationship to care delivered.

Brook *et al*[5] reviewed outcome standards in 1977 and developed models for eight conditions, which have remained unused since their development. The recent release of hospital-level mortality data for Medicare patients by the Health Care Financing Administration has spurred more outcome-based quality assurance. A modification of the "sentinel event"[6] method that flags clearly adverse outcomes for further review has been developed for in-hospital deaths.[7]

Process-based Quality Assurance for Hypertension

The process of medical care includes physician actions (diagnostic and therapeutic) as well as patient compliance. An early example of process criteria for hypertension was developed by the Albermarle County (Virginia) Medical Society EMCRO.[8] The group used an epidemiologic approach to set standards for primary prevention, case-finding, diagnostic workup, therapy, and follow-up. Subsequently, periodic reports from the Joint National Committee of Detection, Evaluation, and Treatment of High Blood Pressure (most recently 1988[9]) have served to set process criteria that have been adopted in a number of quality assurance studies.[10-11]

Brook and Appel[4] distinguished between *implicit* (global judgment) and *explicit* (list-based) process criteria. Of 114 hypertensive patients treated at Baltimore City Hospital, 27.2 percent were believed to have had adequate medical care (implicit) process by two of three judges; less than 2 percent met all the explicit criteria. The study investigated only quality assessment; it did not evaluate the effect of an intervention on patient care.

A computerized medical record system (COSTAR) has been used to improve medical follow-up among hypertensives at the Harvard Community Health Plan.[12] A related system was developed in Canada to encourage patients to have their blood pressure screened periodically.[13] COSTAR facilitated the evaluation of an institutional quality assurance program that used feedback about individual patients and compared physicians with their peers.[10] The two sets of process criteria studied (initial laboratory testing and follow-up within six months) were unchanged by the intervention, although small improvements were

noted for the subgroup of moderate to severe hypertensives. Blood pressure control, an outcome measure, showed similar disappointing results.

More recent work has compared the use of written cases and chart audits for evaluating physician practice patterns.[11] The 98 family practice residents studied ordered fewer tests in clinical practice compared with the written cases, probably due to cost constraints in actual practice that were not present in the written cases. The two methods may be complementary for further work in the evaluation of clinical practice in an ambulatory setting.

Outcome-based Quality Assurance for Hypertension

Although process criteria are widely used for many clinical conditions, particularly those requiring surgery, outcome criteria are quite compelling for evaluation of quality of care for hypertensives. The fact that clinical trials that have demonstrated that blood pressure control decreases both mortality and events such as myocardial infarction and stroke gives these criteria a high level of validity. At present, the consensus standard is "to achieve and maintain arterial blood pressure below 140/90 mm Hg, if possible."[9] Although the present standard has achieved widespread consensus, the standards used in the following studies vary considerably, due to changes over time and between investigators. This limits comparisons across studies.

Williamson, who developed the outcome-based "health accounting" system of quality assurance,[14-15] studied hypertension extensively. Health accounting sets initial priorities, assesses outcomes, determines if improvement is needed, implements changes, and then reassesses outcomes. In a one-year follow-up of hypertensives with congestive heart failure treated at a Baltimore city hospital emergency room in 1966, he found a case fatality rate of 21 percent, twice that he predicted.[14] Consequently he initiated changes in hypertension evaluation and follow-up in the emergency room. Brook and Appel,[4] who studied physicians at the same hospital in 1971, found that 44 percent of the 114 hypertensive patients remained hypertensive after 5 months, and only 44 percent of the total had acceptable care based on outcome criteria. They concluded that physicians at that institution were encouraged to test for rare underlying causes of hypertension but not to manage it on a long-term basis.[4]

The health accounting approach to hypertension care was also field-tested in two clinics of a health maintenance organization. Thirty-six percent of 248 hypertensives were found to be uncontrolled, much higher than the 5 percent level considered acceptable by the investigators. Importantly, many of the physicians overestimated patient compliance and failed to educate their patients about key control measures. Many patients lacked critical knowledge of hypertension. The health accountant then gave individualized education and feedback to all the physicians and some patients. All patients subsequently had improved control of their hypertension, although the patients who received education improved most, to only 13 percent out of control. Despite a great improvement in hypertension control, the investigators believed further gains could be made.[15]

These studies led to a controlled trial at Johns Hopkins Hospital of a one-to-two hour physician tutorial and feedback session based on physician-specific data collected on their patients a few months earlier.[16] The sessions resulted in a voluntary reallocation of physician time to patient education. Patients improved their compliance, and blood pressure was controlled in 69 percent of the experimental group compared with 36 percent of the controls. Though this would appear to be a milestone, it has not been replicated, a fact that may limit its usefulness.

Two more recent investigations into feedback and tutorial found no improvement in blood pressure control for hypertensives.[10,17] Feedback about individual patients was coupled with comparison with other providers by Winickoff *et al.*[10] Dickinson *et al.*[17] used computer-based feedback regarding individual patient control together with physician education similar to that of Inui,[16] without success. Although the physicians demonstrated increased knowledge and both the experimental and control groups improved over 50 percent in levels of blood pressure control during the study, no difference in blood pressure control was found between the two groups.[17] The already high levels of control, 60-80 percent, achieved in these more recent studies may have contributed to the inability to demonstrate an effect. Inui[16] defined blood pressure control based on unspecified criteria developed by study physicians, where Winickoff[10] specified control based on an average diastolic pressure for two categories of severity of illness and Dickinson[17] used age-specific criteria based on both systolic and diastolic pressure. On the other hand, lack of efficacy of the intervention, incorporation of the earlier techniques into general practice, or poor compliance by the patients also may have contributed to these findings.

An active surveillance system at a health care facility in the Bronx, NY, was found to improve blood pressure control by 50 percent among an active population of 2,000 hypertensives.[18] The system used computer cards to generate lists for active follow-up of those patients not seen in at least four months by community-based family health workers. The system also gave the physician and the team feedback about the level of blood pressure control among their patients on a quarterly basis. The system was estimated to cost about $20 per patient per year, not an inexpensive method of self-monitoring.

Nobrega *et al.*[19] evaluated both process and outcome criteria for management of 138 patients with hypertension at the Mayo Clinic. A total of 89 process measures

(including medical history, physical examination, initial laboratory tests, special diagnostic tests, treatment, and follow-up) were established by a group of two experts and three general internists. Completion of the process measures was highly variable, ranging from 10 to 90 percent, although more process measures were completed for patients with severe hypertension. Patient outcomes studied, which ranged from blood pressure control to congestive heart failure to death, were better than predicted. Significantly, the authors failed to find an association between process and outcome. In commenting on the study, Brook[20] noted that this finding "clearly reflect[s] the limitations that continue to plague quality assessment efforts" and suggested it may be due to overly rigid or inappropriately weighted process criteria, lack of control for disease severity, or poor recording of the actual care rendered in the medical chart.

Although the counter-intuitive results reported by Nobrega *et al.*[19] were curious, a randomized trial among 230 hypertensive employees of a Canadian steel mill investigated some of the unmeasured factors suspected to have contributed to some of the poor results seen above.[21] Haynes *et al.* investigated three factors: the decision to treat, the "vigor" of prescribed medications, and patient compliance. The decision to treat was weakly associated with a fall in blood pressure, after adjusting for other factors. The vigor of treatment, based on the medication and dosage, was significantly associated with blood pressure control, as was patient compliance of greater than 80 percent based on pill counts. Thus, certain process measures were associated with the outcome measure of blood pressure control, highlighting the issue of patient compliance.

Although compliance with treatment has been reviewed recently in the *MMJ* in connection with chronic diseases,[22] a few points deserve reiteration. Compliance can be assessed by asking straightforward questions of the patient.[23] Educational programs have been shown to improve long-term blood pressure control in practice settings,[24] particularly when they predispose, enable, and reinforce health-related behaviors.

Conclusions

Peer review as a matter of public policy is continuing to grow in importance and will soon be used in the assessment of outpatient care. The well-documented connection between blood pressure control and prevention of morbidity and mortality make the use of outcome measures logical for evaluation of the quality of hypertensive care. Hyptertensive control is clearly feasible but requires a partnership between physician and patient; neither can achieve it alone. Although one study has shown that review and feedback help improve patients' blood pressure control, the evidence suggests that the overall impact of this intervention is low (that is, as a percent of all treated hypertensives). Nonetheless, low-impact interventions can have a major impact when implemented on a large scale for such a common condition. Process measures appear less useful in assessing the care of hypertensive patients, although ongoing developments may improve their utility. Further work, particularly in the areas of compliance and patient education, is needed to optimize patient outcome in hypertension. There is a growing interest in the link between structures, processes, and outcomes of care in the ambulatory setting, and past studies of hypertension serve as a template for future action.

Victoria E. Cameron
Med Chi's Auxiliary President 1989 - 1990

Victoria E. Cameron is the 1989-90 President of the Auxiliary to the Medical and Chirurgical of Maryland. After studying psychology at Montgomery College and American University, she entered the mortgage banking business where she was employed for several years.

Mrs. Cameron's husband, Dr. Ronald R. Cameron, is a native Marylander. After graduating from the University of Maryland Medical School, Dr. Cameron went into the U.S. Navy where he continued his medical education studying plastic, reconstructive, and hand surgery. Dr. Cameron has been a very active member of the county and state medical societies, having been President of the Montgomery County Medical Society and a member of several county and state committees, as well as an active participant of the regional and national plastic and reconstructive surgical societies. He is a past president of the National Capital Society of Plastic Surgery and currently a clinical Associate Professor of Surgery at Georgetown University Medical Center.

While Mrs. Cameron has always been active in volunteer organizations, she credits her initial interest in the Auxiliary and medical issues to her husband's heavy involvement with organized medicine and its concerns.

After her marriage, Mrs. Cameron worked full time in her husband's practice. She was very active in her children's activities and volunteered at their schools for many years. She became interested in medical issues and served as President of the Auxiliary to the Montgomery County Medical Society, was a member of the Medical Society's Community Affairs Committee, and has held various other positions in the county and state Auxiliaries.

This year as President of the State Auxiliary, she hopes to address two significant issues: legislation and the prevention of child abuse. The battle for legislative reform to help ensure continued quality medical care is one she feels the Auxiliary can help fight. She believes that working cohesively and with the Medical Society, the Auxiliary can be an influence in the outcome of such legislation.

The fight against child abuse is another issue of particular importance to Mrs. Cameron. One of society's most devastating problems, child abuse and its eradication will be a major emphasis with the Auxiliary this year. She has asked each county Auxiliary to do at least one project and/or fund-raiser in this regard.

In addition to her Auxiliary activities, Mrs. Cameron is Chairman of the Advisory Board of the Silver Spring branch of Madison Bank of Maryland, she takes classes at the University of Maryland, and she is working as a licensed realtor. Dr. and Mrs. Cameron have four grown children. The Camerons have recently purchased a home in Annapolis and are enjoying the Annapolitan lifestyle in their free time.

Travel Seminar Fundraiser

Lourdes Morales has arranged a fundraiser for the benefit of AMA ERF in the form of a medical seminar on professional malpractice and practice management. This seminar, presented by the American Educational Institute, offers 20 hours of Category I CME credit and will be held in Hawaii. Mrs. Morales has offered to donate 25 percent of the travel commissions to AMA-ERF. In addition, if at least 16 physicians and their spouses book this trip, we will receive a free trip to auction for AMA-ERF at our annual meeting next April.

The cost of the trip is $1,449 per person and includes round-trip airfare and seven nights'accommodations. The seminar costs $306 for the physician and is complimentary for the spouse. Since the seminars are given year round, there is a choice of sites (Honolulu, Maui-Kaanapali, Maui-Wailea, or Kauai) and dates. For further information, please contact Lourdes Morales at 301-252-5020.

We hope to exceed our goal of $5,000 for this project, but the amount depends on the number participating.

VICTORIA E. CAMERON
Auxiliary President

Auxiliary to the Medical and Chirurgical Faculty of Maryland. Mrs. Victoria Cameron, President; Mrs. Betty J. Molz, Editor. ■

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

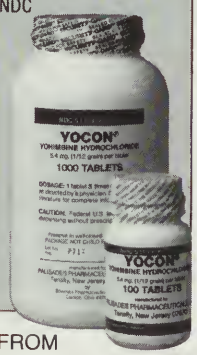
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

The Value of a Broker

Problem: Recently an OB-GYN wanted to switch from one medical malpractice company to another. His current policy expired in May, but by March the Doctor had cleared all scheduled deliveries and wanted to make the change immediately. However, the newly selected medical malpractice carrier refused, claiming their policy was to accept "new business on expiration only".

Solution: William C. Garrett held meetings with company representatives, arguing that the reason for the "on expiration" rule was to keep new insureds from beating already announced July rate increases. In this case, the ruling really didn't apply since the new company's premium rate would be the same whether a policy was issued in March or May. Company officials agreed and the rule was changed to handle such circumstances. Not only did the OB-GYN get more comprehensive coverage; he also saved over $8,000.

Learn why physicians across Maryland have been depending upon William C. Garrett for over 20 years. It pays to deal with a specialist who represents carefully chosen medical malpractice carriers! Write or call:

Regional Chemotherapy for Hepatic Metastases from Colorectal Carcinoma

In the USA, colorectal cancer is the second leading cancer in incidence and deaths from cancer. An estimated 150,000 new cases and 62,000 deaths from it will be reported in 1989; in Maryland 2,900 new cases of colorectal cancer and 1,200 deaths will be reported. Almost 60 percent of patients with this cancer will develop hepatic metastases and among the newly diagnosed patients, almost 20 percent will have hepatic metastases at the initial diagnosis.

Of all the sites of distant metastases from colorectal carcinoma, the liver plays an overriding influence on overall prognosis and survival. Solitary metastasis or few metastatic lesions are confined to one lobe of liver, the most amenable to surgical resection are rare; only 5 to 10 percent of hepatic metastases can be resected. The majority of patients need other treatment modalities.

Systemic chemotherapy using 5 Fluoro-Uracil (5-FU), Fluoro-deoxy-uridine (FUDR), or combination chemotherapy using Nitrosourea compounds (methyl CCNU) and Vincristine achieved a modest response, 20 percent at best. Since in 25 percent of patients with colorectal cancer, the metastases would be confined to the liver, intensive efforts toward treating these first metastatic sites would change the overall prognosis. On this premise, many of the regional therapies for treatment of hepatic metastases are developed.

The liver has a unique blood supply from the arterial and portal venous system. The metastases derive blood from hepatic arterial branches, therefore, an intra-arterial route has therapeutic advantage over the portal venous route. Slowing or occluding the hepatic arterial blood supply (hepatic dearterialization) at the time of intra-arterial infusion of chemotherapy gives maximum therapeutic advantage over intraarterial infusion alone. However, subsequent thrombosis of the hepatic artery and the development of arterial collaterals make this method of chemoinfusion after hepatic dearterialization impractical for long-term infusions.

Discouraged by poor response to systemic chemotherapy without a survival benefit and encouraged by recent advances in infusion pumps, catheters, and surgical techniques, since 1960 many oncologists attempted regional chemotherapy via hepatic artery to the liver. Many phase I, II and now phase III trials using 5-FU or FUDR have been done to scientifically weigh the risk-benefit ratio.

The response rate to regional arterial 5-FU or FUDR infusion has been from 40 to 80 percent. The cumulative response rate reported from the implantable pump FUDR infusion is approximately 50 percent while it is 20 percent for systemic intravenous chemotherapy. The duration of response for intra-arterial infusion chemotherapy ranges from 6 months to 2.5 years with a median duration of 10 months. Average duration of response to systemic chemotherapy has been reported to be only 3 to 6 months.

When compared to systemic intravenous chemotherapy, the survival advantage for FUDR infusion chemotherapy has been demonstrated in patients without extrahepatic spread and especially in those without portal and hepatic lymph node metastases. However, when portal lymph node or other extrahepatic metastases are present, there has been no survival advantage shown. The reported cumulative median survival for the intra-arterial infusion group has been 18 months; for systemic chemotherapy it has been 6 to 8 months.

Implantable pumps for FUDR infusion are commonly used. Although expensive, their ease in outpatient administration of FUDR makes them more convenient compared with external-infusion pumps with a drug reservoir connected to the hepatic artery via an implanted port or a catheter. Percutaneous placement of the hepatic catheter has been described, but common anomalies of hepatic artery increase the chances of uneven perfusion and multiple branches to gastroduodenal area produce gastroduodenal complications. Placement of a catheter and pump by laparotomy is the preferred method. Cholecystectomy is performed on routine basis because of high (20 to 30 percent) incidence of chemical cholecystitis.

Most common side effects of hepatic intra-arterial FUDR infusion are sclerosing cholangitis, chemical hepatitis and gastroduodenal ulceration. Surprisingly, the first two side effects are peculiar only to FUDR infusion. The 5-FU intra-arterial infusion usually does not produce sclerosing cholangitis and chemical hepatitis.

Almost half the of patients will develop extrahepatic metastases while hepatic disease is under control by chemoinfusion through hepatic artery. Therefore, the need to treat other systemic micrometastases is imminent. At present, to control systemic metastases, rather than using conventional systemic 5-FU or FUDR therapy attempts with chemomodulation by leucovorin or continuous high-dose infusion of FUDR are being made.

One Minute With Diabetes

Doctor, since I began taking insulin for my diabetes two years ago, I have been afraid to use alcoholic drinks. This is difficult to avoid in may social situations. All the literature I can find about alcohol and diabetes is ambivalent as to the acceptable amount to drink. Can you give me some guidelines?

Diabetic patients who drink need guidelines to do it safely. Even so, a special set of problems arise. Metabolic control and lipid status, neuroendocrine, gastrointestinal, and sexual function may all be adversely affected.

Alcohol injures the body by acting like an astringent on the cells. It irritates the mucous membrane of the stomach lining. Gastritis often occurs in heavy drinkers. Alcohol is absorbed rapidly directly into the blood stream from the stomach. Only a small amount reaches the small intestine to be absorbed there.

More than 90 percent of the alcohol that enters the body is metabolized (detoxified) by the liver. The longer it is delayed from leaving the stomach by the presence of food, the more slowly it will be metabolized. It takes about six hours to metabolize three drinks of whiskey (4.5 ounces). Alcohol damages liver cells, and if consumed in large amounts over time it will destroy liver tissues (cirrhosis). Destroyed liver tissue cannot properly metabolize glucose, which causes a diabetic state that is very difficult to control.

If a diabetic patient consumes alcohol without associated *hor d'oeuvres* or other food containing carbohydrates and a hypoglycemic reaction occurs, it will likely be profound because alcohol prevents the release of glycogen from the liver as a counter-regulatory mechanism.

Many people successfully go through life without any use of alcohol, which proves that it is not essential. The diabetic patient has an even greater incentive not to use alcohol because it can aggravate the degree of control needed to properly manage his or her disease. The diabetic patient **should not** use alcoholic beverages. However, if a a diabetic patient chooses to use alcohol, some rules should be applied:

1. It should be discussed fully with the physician and family members. The frequency and amount should not be concealed.
2. It should be consumed shortly before eating or with food (carbohydrates).
3. It should be calculated into the meal plan with substitutions something like the following:

Beer	12 oz	Omit 1 bread + 2 fat exchanges
Light beer	12 oz	Omit 1/2 fruit + 2 fat exchanges
Wine, dry	4 oz	Omit 2 fats
Liquor (gin, scotch, whiskey)	1.5oz	Omit 3 fats

4. Always carry a diabetic identification card or bracelet. If you should end up in an emergency facility in a stuporous state with an odor of alcohol on your breath, it will be assumed that you are drunk rather than having a hypoglycemic reaction. As a result either no treatment or improper treatment may follow.
5. Always carry crackers or some form of carbohydrate with you in case the meal is delayed.
6. Never drive after you have been drinking.

Do not be concerned about alcohol used in cooking because the alcohol evaporates during the cooking and only the flavor remains. In conclusion, if you must drink, do so judiciously and anticipate potential complications.

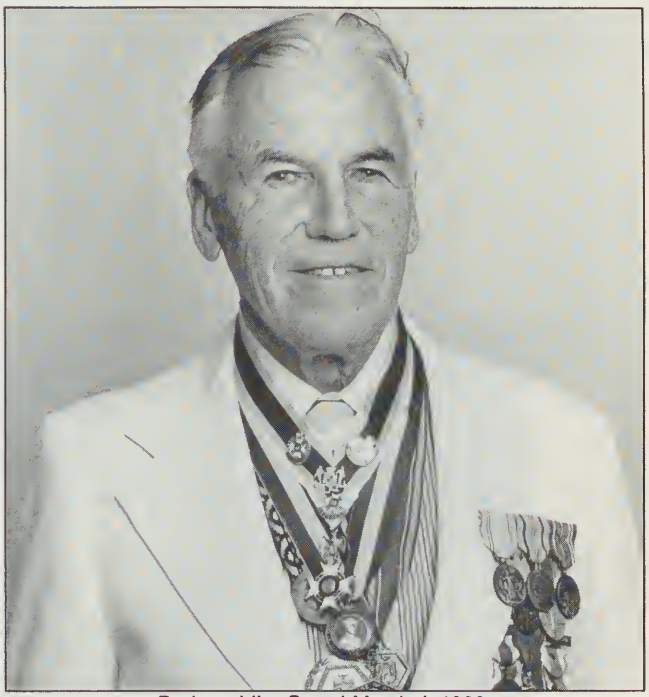
On July 4, 1989, *Henry P. Laughlin MD, ScD, ScSD* served as the National Independence Day Parade's Grand Marshal for the second year in a row. He is the first person to be awarded this honor for two consecutive years. "It was a tremendous honor," Dr. Laughlin said, "Last year at this time I thought I had a 1,001 chance of being Grand Marshal again."

As Grand Marshal, Dr. Laughlin rode in the parade in an Avanti convertible; he also presented several awards and greeted various dignitaries. He was introduced to several members of the White House staff and attended a special VIP tour of the White House on July 5.

An internationally known psychiatrist, author, educator, US Navy veteran, NPS supporter and volunteer, and a representative of the Sons of the American Revolution, Dr. Laughlin is an outstanding representative of medicine.



His medical career began 48 years ago when he received a medical degree from Philadelphia's Temple University in 1941. He served as a physician with the US Navy during World War II where he earned five theatre and service medals and three combat stars. He also has received letters of commendation from the Navy and the US Surgeon General.

For the next 40 years, Dr. Laughlin practiced in psychiatry in Chevy Chase, Bethesda, and the Frederick area where he became a prominent member of many organizations. In 1949, he founded and became the first president of the American College of Psychiatrists. He served as the first and eighth president of the American College of Psychoanalysts and was elected Honorary Life President in 1979. Three years later, the American Society of Physician Analysts named him a Lifetime Honorary President.

Dr. Laughlin was a Clinical Professor of Psychiatry at George Washington University Medical School from 1977 to 1983 and a faculty member for 35 years. In addition, he has served as Distinguished Visiting Professor at the University of Louisville School of Medicine since 1974. He holds honorary doctorates from Ursinus College and the University of Louisville. In honor of his many contributions to psychiatry, both Ursinus College and the American College of Psychoanalysts initiated awards programs in his name.

Long an active participant in organized medicine, Dr. Laughlin represented Montgomery County for 11 years on the Med Chi Council and is a past president of the Montgomery County Medical Society. Dr. Laughlin continues to represent the interests of his colleagues in Council and serves as a representative from Frederick County. On April 23, 1988 the Faculty honored their distinguished member by initiating the Laughlin Awards Program.

Dr. Laughlin is the author of a score of professional books including the medical best sellers: *The Neuroses in Clinical Practice*, *The Ego and Its Defenses*, *Mental Mechanisms*, and *The Neuroses*, along with 133 articles, chapters, editorials and reviews. Dr. Laughlin currently resides in Frederick County with his wife Page.

Dr. Laughlin, Grand Marshal 1989.

Fred R.T. Nelson MD, Potomac, recently was appointed as a charter member of The National Exercise for Life Institute's Advisory Board. Dr. Nelson has a private orthopedic practice in Bethesda, is on the attending staff at Suburban Hospital, and is a clinical assistant professor at the Uniformed Services University of the Health Sciences, and a visiting assistant professor with the University's Human Performance Laboratory. He's also an orthopedic consultant at the Sports Medicine Clinic of the University of Maryland in College Park.

Dr. Nelson's activities also include publishing numerous research papers, serving as past director of research and education for the Department of Orthopedics at the National Naval Medical Center in Bethesda and as an associate professor of the health sciences at the George Washington University School of Medicine.

The Minnesota-based National Exercise for Life Institute collects and disseminates print and electronic materials on the value of regular aerobic exercise encouraging people to start and maintain personal exercise programs in order to maintain overall health and to overcome specific health problems. ■

In Some Countries She Could Wait Months For Her Surgery.

We're not talking about life in the Third World.

Some of the most advanced industrial countries on earth have health care systems that are underfinanced, overextended and ill-equipped.

So what may be routine for us in America, can mean an unbearable wait for people like this little girl in a system where health care expenditures are controlled by government.

Most Americans enjoy the highest quality of health care in the world. We're free to choose from a variety of health care programs. Our medical schools are the world's standard. Our facilities are the most advanced. Without doubt, the U.S. health care system is the finest.

But the system is not without problems.

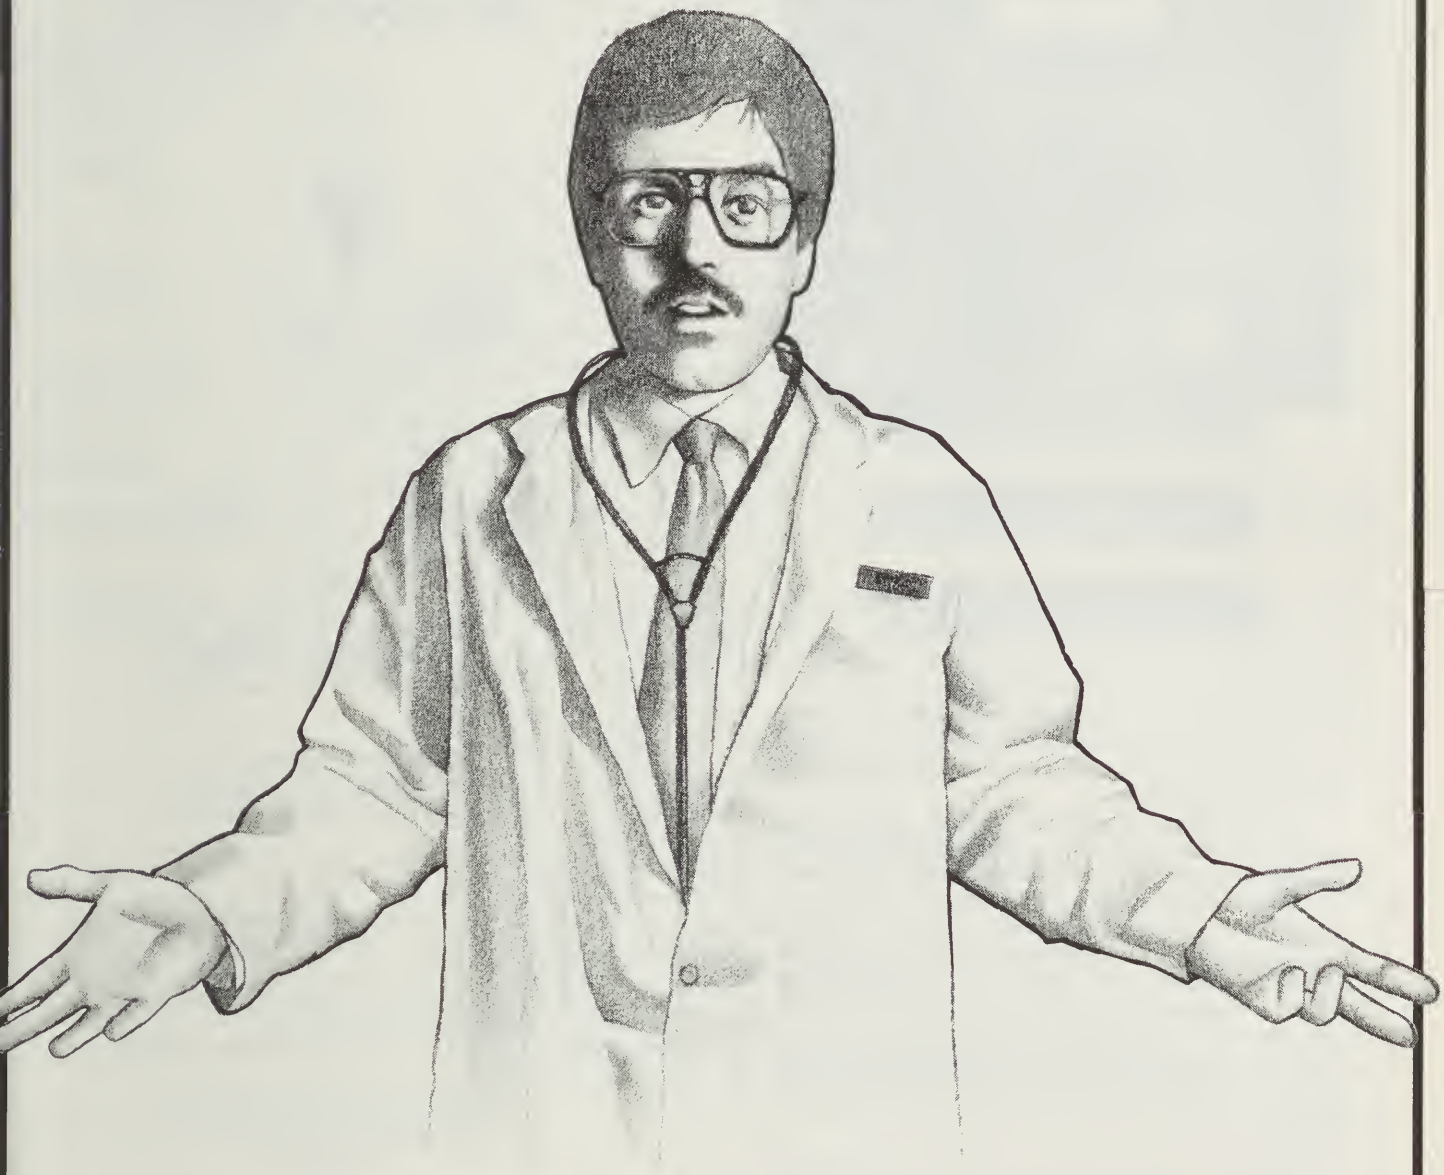
Good medical care by its nature is expensive. Not everyone in America has the resources to get good care. This is a shortcoming of our system, and the American Medical Association has a specific, comprehensive plan to correct it.

Our plan will reform the Medicaid program to cover 100% of those below the poverty level instead of the 40% covered under today's plan.

Our plan will expand employer coverage of workers and their families who lack other insurance.

Our plan will simplify and improve the Medicare system to ensure benefits will always be available to the nation's elderly.

Until these proposals are enacted, the AMA is calling on doctors to reaffirm their profession's tradition of providing care to those who cannot afford it.



We believe the quality of the U.S. health care system can be strengthened through reforms like these in the Medicaid, Medicare and employer health insurance areas.

The AMA urges you to stay informed on the issues. To discuss them with your doctor. And to voice your opinion to your elected representatives.

The goal is clear. We already have the best health care system in the world. What we have to do now is to strengthen it.

American Medical Association

Heart House Learning Center

The American College of Cardiology has been providing continuing medical education to cardiovascular specialists for over 15 years. Attending programs at the Heart House Learning Center is a unique and convenient way of keeping abreast of the latest advances in cardiovascular medicine.

Continuing medical education is imperative for today's medical community and the Learning Center offers an extraordinary and stimulating environment for you to continue your medical education.

The Classroom at Heart House is equipped with 69 Learning Center Chairs, each of which is fitted with a television monitor for viewing videotapes, slides and graphs; a computer response system for evaluating participants' progress; and a tape recorder jack for taping various aspects of the program. The Classroom itself houses, among other things, satellite transmission capability for experiencing actual procedures, as they happen, without leaving your individual learning station. The size of the Classroom affords you an exceptional opportunity to interact with the faculty as well as your fellow participants.

Heart House, the national headquarters of the American College of Cardiology, has been located in Bethesda, Maryland for over 10 years. Its proximity to the National Institutes of Health, the National Library of Medicine and downtown Washington, D.C. has proven to be very beneficial to those attending Learning Center programs.

For more information on the programs being offered at Heart House, please call the Learning Center at 1-800-253-4636 ext. 241 (in Maryland or outside the United States, 1-301-897-5400).

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc. Will Speed Up Your Billing And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s "Computer-Side Manner" Is The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

Baltimore St., Baltimore, MD 21201 (301-328-3956) or by calling the phone number listed under a specific program.

October 12 — **Dean's Conference #1: How to Manage Common Emergencies - Part I**, UMAB Campus, Baltimore. Fee: $25*; AMA & AAFP credits available.

October 21 — **Ischemic Nitrates**, Stouffer Harbor Place Hotel, Baltimore. Fee and credits TBA.

November 10 — **Clinical Neuroimmunology Synmposium**, Baltimore Marriott Inner Harbor Hotel, 9 a.m. - 5:30 p.m. Info: Dept. Neuroology, UMD, 22 S. Greene St., Baltimore, MD 21201 (301-328-6484).

November 11 — **Neurology and Music at Maryland - Session I**, Updates on available diagnostic evaluation procedures for neurologic problems plus pertinent information on stroke. A day of medical education, an evening of entertainment by the Baltimore Symphony Orchestra. Info: Dept. Neurology, UMD, 22 S. Greene St., Baltimore, MD 21201 (301-328-6484).

November 30 — **Dean's Conference #2: How to Manage Common Emergencies - Part 2**, UMAB Campus, Baltimore. Fee: $25*; AMA & AAFP credits available.

December 13 — **Dean's Conference #3: Common Medical Problems**, UMAB Campus, Baltimore. Fee: $25*; AMA & AAFP credits available.

January 25 — **Dean's Conference #4: Common Psychiatric Problems**, UMAB Campus, Baltimore. Fee: $25*; AMA & AAFP credits available.

February 23 — **Dean's Conference #5: Advances in Clinical Therapeutics**, UMAB Campus, Baltimore. Fee: $25*; AMA and AAFP credits available.

February 24 — **Neurology and Music at Maryland - Session II**, Reports on epilepsy, pain and recurring disorders, and multiple sclerosis, AIDS, and other neurologic infections. A day of medical education, an evening of entertainment by the Baltimore Symphony Orchestra. Info: Dept. Neurology, UMD, 22 S. Greene St., Baltimore, MD 21201 (301-328-6484).

Continuously Throughout the Year

University of Maryland Dean's Conferences - Held monthly, these conferences are designed for the Family/General practitioner and the internist. Each conference highlights a different clinical department, placing emphasis on the practical methods currently being used and researched at the University of Maryland. **1990 Dates: March 22 and April 26.**

Visiting Professor Program - Directory of speakers and topics available for area hospitals and other health care organizations. No administrative fee. Info: 301-328-3956.

Visiting Practitioner Preceptorships - Opportunity for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Hour-for-hour Cat I credits available. Direct **all** inquiries to CME 301-328-3956.

Departmental Rounds and Conferences - Weekly, hands-on and lecture presentation hosted by the University's clinical departments. Hour-for-hour AMA Cat I credits available. Brochure available.

Advanced Trauma Life Support Provider/Instructor Programs sponsored by University of Maryland/MIEMSS. Info: M. Nelson 301-328-2919.

Oct 19-20 - Provider
Nov 16-17 - Provider
Dec 14-15 - Provider ■

**Cost if special package plan (all seven courses for $175) is used. Individual courses priced at $35 each. Call for details.*

TAX RELIEF

Have You Ever Earned Interest on Taxes You Paid to the IRS?

You can have Interest Bearing Savings and pay tax on the annual interest or defer the tax

For example:

	$100,000 Bank Deposit *Earning 9% (Taxable)*	vs	$100,000 Insurance Company *Earning 9% (Tax Deferred)*
Account Value *			
Year 10	$169,202		$ 236,735
20	286,294		560,435
30	484,416		1,326,745

Annual Income assuming 9% interest and no depletion of principal:

484,416 x 9% = 43,597 vs 1,326,745 x 9% = 119,407

It's a basic principle: The greater your principal, the greater your income. This is accomplished through tax deferral rather than current taxation.

* Tax Bracket Assumed = 40%

POSITIONS AVAILABLE
Expanding multispecialty Internal Medicine Group seeks BC/BE Family Practice and Internal Medicine physicians for busy, stimulating practice. Modern facility with laboratory and x-ray. Howard County provides many opportunities to share both cultural and recreational opportunities. Competitive salary and full benefit package. Call or send resume to: Admnistrator, Drs. Flowers, Levine, Prada, & Assoc., MD, PA, 11055 Little Patuxent Pkwy., Columbia, MD 21044 (301-740-2900).

PRACTICE AVAILABLE
Expanding personal injury and general medicine practice on heavily trafficed Eastern Ave.; $20,000/month accounts receivable. Call 301-255-1496.

SEEKING BE/BC OB/GYN
Well-established solo practice in Baltimore area; teaching hospital. Excellent salary & fringe benefits leading to full partnership. Send CV to Box 14 *MMJ*. 1211 Cathedral St., Baltimore, MD 21201.

MEDICAL HOUSE OFFICERS NEEDED
Full and part time medical house officers (BC/BE) needed in 200-bed acute care facility in Baltimore. Flexible hours. Requires completion of approved medical residency program and ICU experience. ACLS preferred. Send CV to Box 13 *MMJ*, 1211 Cathedral St., Baltimore, MD 21201.

INTERNIST WANTED
Full or part time with opportunity to join 2-person group, practicing out of GBMC and St. Joseph's. Send CV to Linda c/o 6301 N. Charles St. - Ste. 8, Baltimore, MD 21212.

PRACTICE FOR SALE BALTIMORE
Endocrinology & Internal Medicine, includes equipment and supplies; located on major thoroughfare near city-county line. Box 15 *MMJ*, 1211 Cathedral St., Baltimore, MD 21201.

WANTED: FULL-TIME INTERNIST
To join 3-physician Internal Medicine group in Towson area. Excellent salary, benefits, bonus, and growth potential. Start ASAP. Call Debby 301-828-9600.

FRANKLIN SQUARE MEDICAL ARTS BUILDING
Office rental, furnished, 1/2 duplex office - efficient layout for 2nd office. Secretarial area, private office, 2 exam rooms; share waiting room and utility area. 301-574-3840.

OFFICE SPACE TO SUBLET
Full or part time. 1800 sq ft, fully furnished, medical office space, equipped treatment and exam rooms. Free parking. Forest Hill, MD. For details: 301-821-8181.

SUBLEASE FULL OR PART-TIME
1,000 sq ft medical office space, fully furnished. Rapidly growing area in Cockeysville, easy access of York Rd. and Rt. 83. 301-889-2900.

SHARE/SUBLEASE OFFICE SPACE
Middle River area; fully furnished and equipped. Prefer a specialist need one or two days/evenings per week 301-391-6996.

VASOTEC®

(ENALAPRIL MALEATE | MSD)

VASOTEC is available in 2.5-mg, 5-mg, 10-mg, and 20-mg tablet strengths.

Contraindications: VASOTEC® (Enalapril Maleate, MSD) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Heart failure patients given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See DOSAGE AND ADMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in heart failure patients), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASOTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See DOSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (> 5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patients, but was not a cause for discontinuation.

Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and DOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation of both drugs. Although a causal relationship has not been established, it is recommended that caution be exercised when lithium is used concomitantly with VASOTEC and serum lithium levels should be monitored frequently.

Pregnancy—Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies of enalapril in pregnant women. However, data are available that show enalapril crosses the human placenta. Because the risk of fetal toxicity with the use of ACE inhibitors has not been clearly defined, VASOTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Postmarketing experience with all ACE inhibitors thus far suggests the following with regard to pregnancy outcome. Inadvertent exposure limited to the first trimester of pregnancy has not been reported to affect fetal outcome adversely. Fetal exposure during the second and third trimesters of pregnancy has been associated with fetal and neonatal morbidity and mortality.

When ACE inhibitors are used during the later stages of pregnancy, there have been reports of hypotension and decreased renal perfusion in the newborn. Oligohydramnios in the mother has also been reported, presumably representing decreased renal function in the fetus. Infants exposed *in utero* to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion with the administration of fluids and pressors as appropriate. Problems associated with prematurity such as patent ductus arteriosus have occurred in association with maternal use of ACE inhibitors, but it is not clear whether they are related to ACE inhibition, maternal hypertension, or the underlying prematurity.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 2987 patients.

HYPERTENSION: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

HEART FAILURE: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); cardiac arrest; pulmonary embolism and infarction; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis or cholestatic jaundice, melena, anorexia, dyspepsia, constipation, glossitis.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).

Respiratory: Bronchospasm, rhinorrhea, asthma, upper respiratory infection.

Skin: Herpes zoster, pruritus, alopecia, flushing, photosensitivity.

Other: Vasculitis, muscle cramps, hyperhidrosis, impotence, blurred vision, taste alteration, tinnitus.

A symptom complex has been reported which may include fever, myalgia, and arthralgia; an elevated erythrocyte sedimentation rate may be present. Rash or other dermatologic manifestations may occur. These symptoms have disappeared after discontinuation of therapy.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation of therapy in 1.9% of patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g % and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, if possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) If the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASOTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance >30 mL/min (serum creatinine ot up to approximately 3 mg/dL). For patients with creatinine clearance ≤30 mL/min (serum creatinine ≥3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.

Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range for the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Dosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Heart Failure Patients with Renal Impairment or Hyponatremia: In heart failure patients with hyponatremia (serum sodium < 130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure*, WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

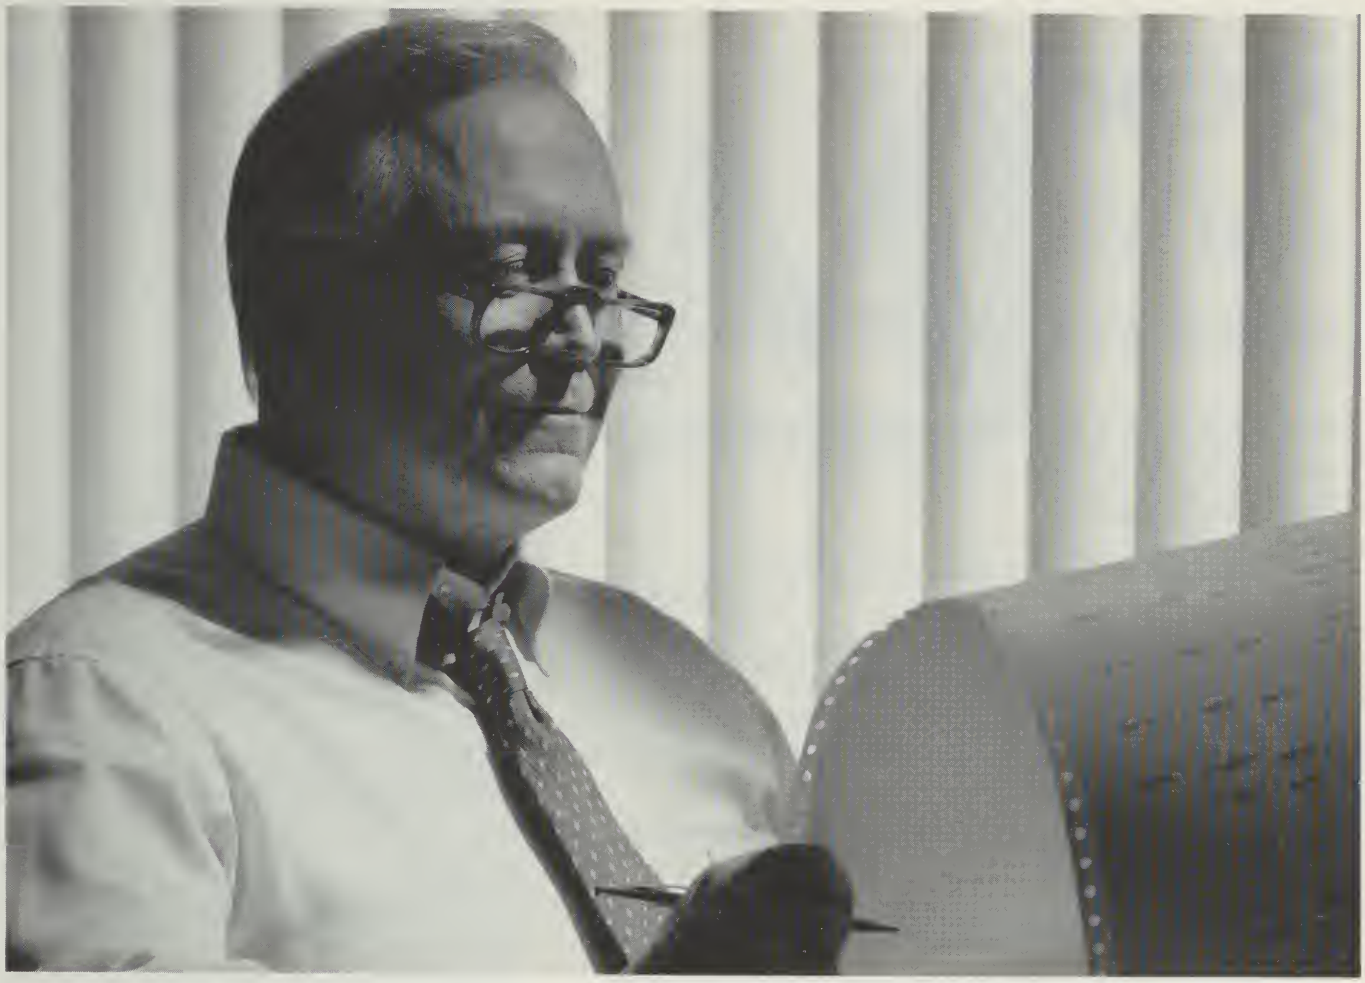
Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.



Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.

Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

Three financial reasons why practices choose the ACCLAIM™ Medical System

There are many compelling reasons to automate with the ACCLAIM Medical System. Here are three important benefits our customers have taken the time to write to us about:

1 Improved Cash Flow

"We have seen dramatic improvements in the efficiency of filing insurance claims and tracking accounts. We've also seen substantial improvement in our accounts receivable."

Susan Shaffer, Office Manager
Single Physician Practice

2 Increased Productivity

"The system is easy to use, straightforward in its commands and simplifies medical office management beyond belief."

Judy Greenburg, Office Manager
Four Physician Practice

3 Financial Control

"Sentient's ACCLAIM system has improved our collections by 100% and has provided reliable data on which to base practice management decisions."

Frank J. Mayo, M.D., Pulmonologist

Sentient Systems offers total solutions. Hardware (IBM® and compatible), software, installation, data conversion, training, support and service are a part of every system. We provide the highest quality medical system available today. Just ask our customers.

THE MEDICAL COMPUTING LEADER

A Choice.

Just what the doctors ordered.

Now that you have a choice of professional liability insurers, how do you compare your options? Consider these important points:

- **The protection you get from your policy**

Princeton's exclusive *Occurrence Plus* policy gives you comprehensive protection - including "tail" coverage - that's complete when purchased. With some other policies on the market, you might wait years before receiving such coverage.

- **The company's experience in medical malpractice claims management**

Princeton is known for providing a strong defense against meritless claims, and that helps protect your professional reputation. Our exceptional claims management record reflects our years of experience in resolving medical malpractice cases.

- **The company's financial strength and stability**

With its parent organization, Princeton Insurance Company ranks as the nation's 10th largest professional liability carrier for medical professionals. And Princeton has one of the lowest loss ratios among the top 10.

To learn more about how Princeton compares, contact one of the independent insurance agents that represent Princeton.

ARTICLES

Perspectives on Genetic Disorders 897
Carmine M. Valente PhD and Albert M. Antlitz MD

Support of Genetic Disorders 899
Beverly S. Raff PhD

Historical Perspectives: The Understanding and Management of Genetic Disorders 901
Victor A. McKusick MD
In the last 30 years clinical genetics has become a defined specialty, and at the same time, genetics has been incorporated into the warp and woof of clinical medicine, every aspect and every specialty being involved.

Demographic and Epidemiological Perspective on Genetic Disorders 911
Nancy E. Maestri PhD and Joann A. Boughman PhD
The study of genetic disorders from the demographic and epidemiologic perspective focuses on the evaluation of the frequencies and the issues of heterogeneity and variability of these disorders among populations.

Recent Advances in Genetics 917
Miriam G. Blitzer PhD, Stuart Schwartz PhD, Tina M. Cowan PhD, and Leslie J. Raffel MD
Recent advances in the specialties of molecular genetics, biochemical genetics, and cytogenetics have made it apparent that comprehending their interdependence is necessary for complete understanding of genetic disease.

State-Sponsored Genetic Services in Maryland 925
Susan R. Panny MD and Barbara A. Bernhardt MS
A cooperative network including Department of Health and Mental Hygiene (DHMH) units, university teaching hospital genetics units, and voluntary groups delivers state-sponsored medical genetic services in Maryland. Maryland's system is one of the most extensive and accessible in the United States.

Gaps in Service: Patient/Family Perspective 933
Rita Beck Black DSW and Joan O. Weiss ACSW
Findings from a national survey of members of 15 genetic support groups indicate difficulties in obtaining desired genetic information because of delays in finding appropriate professional resources, lengthy travel time to those resources, financial costs, and limited flexibility in appointment schedules.

Prenatal Genetic Concerns 939
C. Lynn Keene MD and Devereux N. Saller, Jr., MD
All health care providers should be aware of the available standard genetic screening tests as well as special studies that may be indicated for the pregnant patient.

Medical
and Chirurgical Faculty
of Maryland

Assessment of Genetic Disorders: Pediatrics 945
R. Stephen Amato MD, PhD
Genetic disorders are surprisingly common. With time, a genetic approach to human health and disease will be integrated into the practice of every clinician.

Assessing the Roles of Genes in Diseases of Adulthood 949
Reed E. Pyeritz MD, PhD
The cause of common diseases of adulthood is invariably a complex nexus that includes genetic factors. A wide variety of disorders caused by mutations in single genes may not become evident until adulthood.

Genetic Counseling and Patient Education 953
Barbara A. Bernhardt MS
Genetic counseling, a process beginning with the identification of at-risk individuals or families, is a medical service aimed at educating the family about all aspects of a genetic disorder, outlining options open to the family, and promoting autonomous decision making.

Who Is the Patient? A Moral Problem 957
Robert Wachbroit PhD
As more and more diseases come to be seen as neither personal injuries nor potential epidemics, the problem of who is the patient will become a central ethical concern for physicians.

NOVEMBER 1989
New Communicable Disease Regulations

The new Code of Maryland Regulations, Communicable Diseases 10.06.01, on the reporting and control of communicable diseases, went into effect in August 1989. The following is a copy of the majority of these regulations. The sections on sexually transmitted diseases (STD), including human immunodeficiency virus (HIV), have been omitted because they are being revised. They will be printed in a later edition. If you have any questions or need morbidity report cards, call your local health department or call 301-225-6712.

Title 10
DEPARTMENT OF HEALTH AND MENTAL HYGIENE

Subtitle 06 DISEASES

10.06.01 Communicable Diseases

Authority: Health-General Article, §§2-104(b) and 18-101 et seq., Annotated Code of Maryland

.03 Reportable Diseases, Conditions, Outbreaks, and Unusual Manifestations.

A. List of Reportable Diseases and Conditions.

(1) Amebiasis;
*(2) Animal bites;**
*(3) Anthrax;**
*(4) Botulism;**
(5) Brucellosis;
(6) Chancroid;
*(7) Cholera;**
*(8) Diphtheria;**
(9) Encephalitis;
(10) Gonococcal infection;
(11) Granuloma inguinale;
*(12) Haemophilus influenzae type b invasive disease;**
(13) Hepatitis, viral (A, B, non-A/non-B, delta, undetermined);
(14) Human immunodeficiency virus infection (AIDS and all other symptomatic infections);
(15) Kawasaki syndrome;
(16) Legionellosis;
(17) Leprosy;
(18) Leptospirosis;
(19) Lyme disease;
(20) Lymphogranuloma venereum;
(21) Malaria;
*(22) Measles (Rubeola);**
(23) Meningitis (viral, bacterial, parasitic, and fungal);
*(24) Meningococcal disease;**
(25) Mumps (infectious parotitis);
(26) Mycobacteriosis, other than tuberculosis and leprosy;
*(27) Pertussis;**
(28) Pertussis vaccine adverse reactions;
*(29) Plague;**
*(30) Poliomyelitis;**
(31) Psittacosis;
*(32) Rabies;**
(33) Rocky Mountain spotted fever;
*(34) Rubella (German measles) and congenital rubella syndrome;**
(35) Salmonellosis;
(36) Septicemia in newborns;
(37) Shigellosis;
(38) Syphilis;
(39) Tetanus;
(40) Trichinosis;
(41) Tuberculosis;
(42) Tularemia;
*(43) Typhoid fever (case or carrier, or both, of Salmonella typhi).**

B. The diseases or conditions shown with an asterisk (*) in §A, above, shall be reported immediately by telephone and in accordance with Regulation .04.

C. Outbreaks and Single Cases of Diseases of Public Health Importance. An outbreak of a disease of known or unknown etiology that may be a danger to the public health is reportable. A single case of a disease not included in §A, above, of known or unknown etiology that may be a danger to the public health is reportable.

D. Unusual Manifestations. An unusual manifestation of a communicable disease in an individual is reportable.

.04 Reporting Procedures.

A. Sources of Reports.

(1) Health Care Providers. A health care provider, such as a physician, physician's assistant, osteopathic physician, dentist, chiropractor, nurse practitioner, nurse, podiatrist, or any other licensed health care provider, who knows of a case of a reportable disease, condition, outbreak, or unusual manifesta-

tion (see Regulation .03), and a medical examiner and an administrator of a hospital, clinic, dispensary, or nursing home who knows of a case of a reportable disease, condition, outbreak, or unusual manifestation shall report it to the health officer within the time limits specified in §B, below.

(2) School and Child Care Facility Personnel.

(3) Masters of Vessels or Aircraft.

(4) Medical Laboratory Personnel. The director of a medical laboratory shall report to the health officer:

(a) Laboratory evidence of a reportable condition as specified in Health-General Article, §18-205, Annotated Code of Maryland; and

(b) Evidence of any other condition as requested by the Secretary.

(5) Persons listed in §A(1) — (4), above, and any other individual having knowledge of an animal bite shall report the bite to the health officer.

(6) A food establishment (see Health-General Article, §21-301, Annotated Code of Maryland) shall report immediately to the health officer an occurrence of a reportable disease, condition, outbreak, or unusual manifestation.

B. Method and Timing of Reports.

(1) A person listed in §A of this regulation:

(a) [[Listed in §A shall]] Shall report a case of a disease, condition, outbreak, or unusual manifestation listed in Regulation .03 to the health officer within 48 hours in writing on a form provided by the Secretary and shall include information as prescribed on the form;

(b) Reporting a disease that is noted in Regulation .03A with an asterisk (*) shall report that disease immediately by telephone to the health officer;

(c) [[Listed in §A of this regulation shall]] Shall report an outbreak immediately by telephone to the health officer.

.05 Record Maintenance and Confidentiality.

The custodian of a report identifying an individual that was filed by a reporting source (Regulation .04A) in compliance with the provisions of Health-General Article, §§18-201, 18-202, and 18-205, Annotated Code of Maryland:

A. Shall keep the report and record confidential;

B. May not open a report or record to public inspection;

C. Shall release a report or record or respond to a subpoena for a report or record in criminal or civil proceeding only pursuant to court order sealing the record; and

D. Shall make a record or report available to a governmental agency performing its lawful duties as authorized by an act of the Maryland General Assembly or the United States Congress when the Secretary determines that the release of information is necessary to protect the public health or to prevent the spread of an infectious or contagious disease.

.06 General Control Measures.

A. Necessary Action. The Secretary or health officer shall:

(1) Take any action or measure necessary to prevent the spread of communicable disease or to control a reportable disease and condition; and

(2) Issue, when necessary, special instructions for control of a disease or condition.

B. Epidemiologic Investigations.

(1) A health officer shall respond to each reported outbreak or suspected outbreak of disease within the health officer's jurisdiction in order to collect data to assist in establishing adequate control measures.

(2) A health officer shall investigate a reported case or suspect case of a condition as requested by the Secretary.

(3) The Secretary may, in conjunction with the health officers, conduct the epidemiologic investigation for each reported case or suspected case in an outbreak involving two or more jurisdictions or states.

(4) An individual, business, facility, or agency shall make available to the Secretary or the health officer all records and information necessary to the epidemiologic response or investigation.

C. The health officer or Secretary shall order cessation of operation of a business or facility determined or suspected to be a threat to public health until the public health threat is determined by the health officer to have ceased.

D. Carrier Approval.

(1) The health officer shall grant or deny approval to a carrier of a communicable disease to work in any of the following occupations involving:

(a) Care of young children;

(b) Care of the elderly;

(c) Food handling; and

(d) Patient care.

(2) The health officer shall grant or deny approval to a carrier of a communicable disease to attend:

(a) School; or

(b) A child care facility.

(3) The health officer shall consider the following when granting or denying approval to a carrier of a communicable disease to work in occupations or to attend settings listed under §D(1) and (2), above:

(a) The seriousness of the disease;

(b) The route or routes of transmission of the disease;

(c) The contagiousness of the disease;

(d) The behavior, neurological development and condition, and physical condition of the carrier;

(e) The susceptibility to the disease of those likely to be exposed to the carrier in the occupation or setting;

(f) The precautions that may be taken to minimize or eliminate the danger of transmission; and

(g) Precedents in the practice of public health.

E. Control of Food Handlers. A case with any of the following diseases, or a confirmed or suspected carrier of the organisms causing any of the following diseases, may not serve or handle, in any manner whatsoever, food intended for public consumption:

(1) Amebiasis caused by Entamoeba histolytica (see Regulation .08);

(2) Cholera;

(3) Disease causing diarrhea, unless physician-certified as noninfectious;

(4) Diphtheria;

(5) Hepatitis A (see Regulation .10);

(6) Salmonellosis (see Regulation .16);

(7) Shigellosis (see Regulation .20);

(8) Streptococcal infection caused by group A beta-hemolytic Streptococcus;

(9) Typhoid fever or carrier of Salmonella typhi (see Regulation .23).

F. Control of Communicable Diseases in Schools and Child Care Facilities.

.08 Amebiasis.

A. Control of a Case. A case may not participate in an occupation involving patient care, care of young children or the elderly, and food handling until diarrhea has ceased.

B. Control of Contacts.

(1) The health officer shall investigate only household and close contacts whose occupations involve food handling, patient care, and care of young children or the elderly.

(2) A contact who has diarrhea shall submit three fecal specimens for examination. If a specimen is positive for Entamoeba histolytica, the contact becomes a case, and the control measures specified in §A, above, apply.

C. Infection Control. Health care providers shall practice enteric precautions.

.10 ***Hepatitis, Viral Type A.***

A. Control of a Case. A case may not participate in an occupation involving food handling, patient care, or care of young children or the elderly for 1 week after onset of jaundice, or for 2 weeks after the onset of illness, if not jaundiced.

B. Control of Contacts. The physician in attendance or the health officer shall offer immune globulin to contacts for prophylaxis as soon as possible, but within 2 weeks of exposure to household, sexual, child care, or other contacts as determined by the health officer.

C. Infection Control. Health care providers shall practice enteric precautions.

.11 ***Hepatitis, Viral Type B.***

A. Control of a Case. A physician in attendance upon a case having viral hepatitis type B shall educate that case on the:

(1) Risks of sexual transmission, maternal-infant transmission, and transmission by the sharing of hypodermic needles and other drug paraphernalia; and

(2) Availability of hepatitis B vaccine and hepatitis B immune globulin for contacts who have had sexual contact with a case of hepatitis B within the preceding 14 days, contacts who have percutaneous exposures to hepatitis B, and infants born to case mothers who carry hepatitis B virus at delivery, and the need for referring those contacts to health care providers for preventive treatment.

B. Control of Contacts. A physician or health officer in attendance upon a contact of viral hepatitis type B shall:

(1) Educate that contact about the availability of vaccine and hepatitis B immune globulin for contacts who have had sexual contact with the case within the preceding 14 days, and contacts who have percutaneous exposures; and

(2) Recommend appropriate preventive treatment.

C. Infection Control. Health care providers shall practice universal precautions.

.12 ***Measles (Rubeola).***

A. Control of a Case. A case may not attend a school or child care facility from the onset of the illness at least through the 4th day after the rash appears.

B. Control of Contacts. The health officer may require all nonimmune individuals to be excluded from a school or child care facility when a case of measles is diagnosed or suspected in a student, employee, or volunteer of the school or facility. The health officer shall authorize readmission upon documented proof of immunity in the form of immunization record, serologic test, or the low likelihood of disease transmission.

C. Infection Control. Health care providers shall practice respiratory precautions from the onset of illness at least through the 4th day after the rash appears.

.13 ***Psittacosis.***

A. There is no control of a case or contacts.

B. Infection Control. A health care provider shall practice appropriate disinfection or disposal of respiratory discharges.

C. The sale, distribution, and quarantine or exotic birds shall be subject to Health-General Article, §§24-101 — 24-110, Annotated Code of Maryland.

.14 ***Rabies.***

A. Control of a Case (Human). A health care provider shall apply contact isolation to the case for the period of communicability.

B. Control of Contacts. A health officer or health care provider shall evaluate individually a close contact or hospital contact to determine the need for post-exposure rabies prophylaxis. A health care provider shall warn an immediate attendant of the hazard of infection.

C. Infection Control. A health care provider shall practice contract isolation.

D. Confinement or Examination of Animals. The health officer or the Maryland Public Health Veterinarian shall direct the quarantine, examination, control, and disposition of any animal that bites or otherwise potentially exposes a human to rabies, according to COMAR 10.06.02.

.15 ***Rubella (German Measles).***

A. Control of a Case.

(1) A health officer or health care provider shall recommend that a case be isolated from a woman of childbearing age who is not immune or is of unknown immunity, from the onset of illness through the 7th day after appearance of the rash.

(2) A case may not attend a school or child care facility from the onset of the illness through the 7th day after the appearance of the rash.

B. Control of Contacts. The health officer:

(1) May require all nonimmune individuals to be excluded from a school or child care facility when a case of rubella is diagnosed or suspected in a student or other employee or volunteer of that school or facility;

(2) Shall authorize readmission by documented proof of immunity in the form of an immunization record, serologic test, or the low likelihood of disease transmission.

C. Infection Control. A health care provider shall provide contact isolation for 7 days after onset of rash.

.16 ***Salmonellosis.***

A. Control of a Case.

(1) A case may not attend a child care facility until the:

(a) Case's fecal cultures are Salmonella free on three consecutive specimens collected not less than 24 hours apart and not sooner than 48 hours following discontinuation of antibiotics (if antibiotics have been given); or

(b) Health officer approves readmission based on the likelihood of disease transmission.

(2) A case with or without diarrhea may not participate in an occupation involving food handling, patient care, or care of young children or the elderly until:

(a) Fecal cultures are Salmonella free on three consecutive specimens collected not less than 24 hours apart and not sooner than 48 hours following discontinuation of antibiotics (if antibiotics have been given); or

(b) The health officer approves resumption of occupational duties based on the low likelihood of disease transmission.

B. Control of Contacts. The health officer shall require culture of feces only of those household and close contacts who attend child care facilities or whose occupations involve food handling, patient care, or care of young children or the elderly. A contact shall submit for examination two fecal specimens taken at an interval of not less than 24 hours. If either of these specimens is positive for Salmonella, the health officer shall consider the contact to be a case, and the control measures specified in §A, above, shall apply.

C. Infection Control. A health care provider shall practice enteric precautions.

D. Control of Carriers. A health care provider shall apply the same control measures to carriers as to cases.

.17 Sexually Transmitted Diseases — Chancroid, Gonococcal Infections, Granuloma Inguinale, Lymphogranuloma Venereum, and Syphilis.

To follow in a later issue.

.18 Sexually Transmitted Disease — Human Immunodeficiency Virus (HIV) Infection.

To follow in a later issue.

.19 Other Sexually Transmitted Diseases.

A. Control of a Case.

(1) Hepatitis, Viral type B — see Regulation .11.

(2) A physician in attendance upon a person who appears to have, or who has a sexually transmissible disease in a stage which is or may become communicable, shall:

(a) Instruct the person on the modes of transmission and the prevention of transmission;

(b) Render any necessary treatment to the case; and

(c) Advise the case to inform a sexual partner or partners of exposure and the need for examination and treatment.

B. Control of Contacts.

(1) Hepatitis, Viral type B — see Regulation .11.

(2) A physician in attendance upon a person who is a sexual contact of a case of a sexually transmitted disease shall perform a medical examination and render indicated treatment.

.20 Shigellosis.

Same regulations as for Salmonellosis. See Section .16, above.

.21 Trichinosis.

A. There is no control of a case or contacts.

B. Environmental Control. The health officer shall:

(1) Collect the suspect food for laboratory examination;

(2) Determine and order the proper disposition of the product if it is a homemade product intended for home use only that has been implicated by epidemiologic or laboratory evidence; and

(3) Notify the Secretary, who shall have the product withdrawn from sale or distribution and shall order the proper disposition of the product that is implicated by epidemiologic or laboratory evidence if it is a product offered for sale in commerce or donated to a charitable organization.

.22 Tuberculosis.

A. Control of a Case.

(1) A health officer or health care provider shall isolate a patient who is in a communicable stage as long as the specific microorganism is excreted by the patient.

(2) A patient fulfills the requirements of isolation as long as the patient receives adequate chemotherapy, is under medical supervision, and observes the instructions issued by a health officer.

(3) The health officer shall instruct the patient in the proper disposal of sputum.

(4) Noncooperative Patient.

(a) A health officer shall place in isolation a person having tuberculosis in a communicable stage who refuses to observe the instructions of the health officer and exposes others to infection.

(b) The person shall remain in isolation until the health officer considers isolation no longer necessary for the protection of the public based on the low likelihood of transmission.

(c) When it is necessary to restrict an uncooperative tuberculosis case, a health officer shall seek to implement the least restrictive option of:

(i) Restriction of the case to home when others at home are not at risk of exposure;

(ii) Voluntary admission of the case to a hospital for treatment;

(iii) Court ordered admission of the case to a hospital for treatment; or

(iv) Court ordered incarceration of the case when the previous steps to restrict the person are not effective.

B. Control of Contacts. The health officer shall:

(1) Direct that tuberculin testing be performed on contacts of cases of tuberculosis in a communicable stage; and

(2) Recommend appropriate chemopreventive therapy.

C. Infection Control. A health care provider shall practice tuberculosis isolation on cases of pulmonary tuberculosis and drainage/secretion precautions on cases with extrapulmonary draining lesions.

.23 Typhoid Fever.

A. Control of a Case.

(1) A case may not attend a child care facility until fecal and urine specimens are Salmonella free on three consecutive specimens collected not less than 24 hours apart and not sooner than 48 hours following discontinuation of antibiotics, or until the health officer approves readmission based on the low likelihood of transmission.

(2) A case may not participate in occupations involving food handling, patient care, or care of young children or the elderly until fecal and urine specimens are Salmonella free on three consecutive specimens collected not less than 24 hours apart, not sooner than 48 hours after discontinuation of antibiotics, and not earlier than 1 month after onset.

(3) If any one of the specimens required in §A(1) or (2) is positive, at least three consecutive negative cultures of feces and urine at intervals of 1 month within the 12 months following onset shall be required for release.

(4) If a person continues to excrete Salmonella typhi at 12 months, the requirements of §D, below, apply.

B. Control of Contacts. Household, sexual, and other close contacts of a case or carrier may not participate in occupations involving food handling, patient care, or care of young children or the elderly until three consecutive cultures of feces and urine taken at least 24 hours apart are negative.

C. Infection Control. A health care provider shall practice enteric precautions.

D. Control of Carriers.

(1) A health officer shall:

(a) Monitor the location, occupation, and bacteriological status of a carrier of Salmonella typhi;

(b) Keep a complete file of all pertinent data on the carrier;

(c) Issue written instructions to the carrier concerning the restrictions upon and responsibilities of the carrier;

(d) Contact each carrier in the health officer's jurisdiction at intervals of not more than 1 year to check on the carrier's occupation and address and to determine if all instructions are being followed;

(e) Release a carrier from supervision only after there have been six consecutive negative cultures of feces and urine, taken 1 month apart; and

(f) Forward immediately to the Secretary a report of a carrier who has relocated outside the health officer's territorial jurisdiction for referral to the health officer of the proper jurisdiction.

(2) A case or a case's physician shall submit the fecal and urine specimens to the State Laboratory for the release of a carrier.

(3) A carrier:

(a) May not participate in occupations involving food handling, patient care, or care of young children or the elderly;

(b) Shall abide by Regulation .06D and E; and

(c) Shall keep the health officer informed at all times of the carrier's address and occupation, and shall notify the health officer at once of any change in address or occupation.

Computer Memory

When the IBM Personal Computer was first introduced in the early 1980s its central processing unit (sometimes referred to as CPU) was the Intel 8088 microprocessor. This processor was limited to a 1 megabyte address space, that is, the microprocessor could access up to 1024K of memory. At about the same time that IBM was introducing its first PCs, Intel was introducing the 80286 microprocessor. The 80286 represented a major advancement since it would be compatible with the 8088 and had the capability of directly accessing up to 16 megabytes of memory. Intel carried out the backward compatibility by having two distinct modes of operation on the 80286. The 8088 compatible mode is referred to as Real Mode, while the 80286's native mode is called Protected Mode. Since then Intel has introduced the 80386 microprocessor, compatible with both the 8088 and the 80286 modes and is now in the process of introducing its new 80486 microprocessor, which will more than likely be backwards compatible with its other microprocessors.

Conventional Memory

When the IBM PC was first developed, it was available with several operating systems. The most popular was the operating system developed by Microsoft, PC-DOS (Personal Computer Disk Operating System). DOS was developed for the 8088 microprocessor and is built around the limitation of a 1 megabyte address space. DOS uses 640K of its assumed 1 megabyte of memory for the running of programs. The remaining 384K of address space is reserved for video display RAM, system BIOS (Basic Input Output System) ROM(Read Only Memory). Computers running under DOS efficiently use only a 1 megabyte address space. Computers with 80286 or 80386 processors running under DOS generally operate in Real Mode, which permits the processor to address a maximum of only 1 megabyte of memory.

Conventional memory (sometimes called system memory) is the memory that DOS can access directly. While the 80286 and the 80386 microprocessor operating in its 8088 compatible mode can access 1 megabyte, DOS (which is the interface between the user and the microprocessor) can only deal with 640K (655360 bytes) of memory.

Since most programs such as word processors and databases use DOS to interface with the microprocessor, they also are limited to using only 640K. This memory limit has become a problem since it imposes major restrictions on the creation of large databases, spreadsheets, desktop publishing chapters, and computer-aided design files. These programs usually require more than 640K of memory.

Expanded Memory

Expanded memory is a way around the DOS 640K limit. Various companies have devised their own methods of circumventing the DOS limit, but the most popular method uses the expanded memory specification designed by Lotus, Intel, and Microsoft.

Originally developed by the Lotus Development Corporation with the Intel Corporation, the Expanded Memory Specification (EMS) 3.0 became a fairly standardized means of getting around the DOS 640K limit. Microsoft joined forces with Lotus and Intel and developed the Lotus/Intel/Microsoft (LIM) EMS 3.2 standard.

This is how the LIM expanded memory works: The 80286/80386 microprocessor, when in Real Mode, can access 1 megabyte of memory. Part of that megabyte is the 640K used by DOS.

Another part is the 128K used by the computers ROM. Some of the remaining memory is used for screen display, however there are about 128K of addresses left over. The LIM EMS standard takes as many 16K blocks of these unused addresses as possible and uses them as windows into the microprocessor's memory. One can think of it as a text file in a word processor. Only one page of text is on the screen at a time although there are several pages in the file. By pressing the Page Down key, the page on the screen gets replaced by the next page in line. LIM Expanded memory does the same thing, only with memory. This memory paging gives the microprocessor access to an additional 32 megabytes of memory.

To deal with all the page mapping (Paging Up and Paging Down) requries a special program called an Expanded Memory Manager. This program handles all communication between the programs, microprocessor, and the expanded memory add-on boards.

While LIM EMS has enabled the microprocessor to use the expanded memory, the problem remains that DOS still cannot recognize the additional memory. The solution to this problem is to have programs ignore DOS and deal directly with the Expanded Memory Manager (EMM). Only programs written specifically to talk to the EMM can use expanded memory.

Conventional-Expanded Memory

In the original Expanded Memory Specification (EMS 3.0) expanded memory was limited to a single 64K window above the DOS 640K boundary. A new standard, the Enhanced Expanded Memory Specification (EEMS), permitted expanded memory below the 640K boundary. AT machines come equipped with a minimum of at least 512K bytes of memory on the

YOUR OFFICE STAFF WOULD LIKE TO HAVE A WORD WITH YOU

If you're suffering from an upset staff due to billing frustration and overexertion, CADO SYSTEMS has the right prescription for a healthier practice — MENDS II, from VERSYSS INCORPORATED (formerly Contel Business Systems). With over 3,000 installations nationwide, MENDS II is the practice management system designed with your office in mind. It can help you eliminate problems with your accounts receivable management. It can also assist your staff with patient tracking and follow-up, giving you better control of appointments, patient histories, and treatment scheduling. CADO is your single-source solution. From automatic insurance billing, electronic claims submission and general accounting to medical records, data base analysis and word processing, we take care of your practice so you can take care of your patients. We are the "one stop shop" for your entire computer system — including hardware and software selection, financing, installation, service and support.

CADO SYSTEMS has been serving the central Maryland area since 1981 and will continue to do so far into the future.

For you to benefit from our single-source expertise in health care computerization, call us at (301) 581-1212. When it comes to curing practice management problems, we are the specialists.

CADO SYSTEMS — WE OFFER PRACTICE MANAGEMENT SOLUTIONS, NOT JUST COMPUTERS!

CADO SYSTEMS — MARYLAND'S SOLUTION CENTER!

motherboard. This left a 128K region of unused addresses that could be recognized by DOS and also could be used by EEMS applications. Any expanded memory located below the 640K boundary is called conventional-expanded memory.

The only time these conventional-expanded pages will be noticed is when an operating environment for EMS is loaded (Desqview, Windows 286, Framework). These environments can use conventional-expanded memory to speed task switching.

Extended Memory

IBM introduced the IBM AT with a 80286 microprocessor as its Central Processing Unit (CPU). The IBM AT, when running under DOS, is operating in Real Mode. This means that 15 megabytes of its 16 megabyte address space goes virtually unused. The 15 megabytes is referred to as EXTENDED memory. DOS provided no management scheme for the extended memory on the 80286 or the 80386, therefore its usefulness under DOS is limited. To access extended memory from DOS (which operates in Real Mode), the 80286 must be switched to Protected Mode. As this is a fairly cumbersome task, few programs take advantage of it. One commonly used extended memory applications is IBM's VDISK, a RAM resident disk drive utility included in its PC-DOS package.

IBM introduced a new operating system, OS/2, developed for use on its 80286/80386s as well as on the Personal System/2(PS/2) machines. OS/2 runs in the 80286/80386's Protected Mode, which permits it full access to the 16 megabyte address space.

If you are running under OS/2 you will be loading both your operating system and programs into extended memory. When you provide your system with more RAM, OS/2 can run larger programs, provide larger disk caches and print buffers, and switch between tasks more quickly. If you are running under DOS, extended memory gives you more data space for sophisticated application programs or print spoolers and RAM disks.

GENERAL SURGEON

An immediate position is available for a BC or BE General Surgeon to join two established general surgeons in a busy private practice. Training or experience in Vascular Surgery and Trauma Surgery desirable. The practice is located in Hagerstown, MD, in scenic western Maryland. With an immediate population of 100,000, this is a growing area, yet provides a high quality of life. Baltimore, Maryland and Washington, D.C. are within an hour's drive, offering unmatched educational and cultural offerings.

The President's Letter

Prepared by the President of the Medical and Chirurgical Faculty of Maryland as a service to its members

September, 1989

Medical and Chirurgical Faculty of Maryland

It gives me pleasure to provide this brief report on my perspective of the Faculty's 1989 Semiannual meeting in Ocean City.

The meeting convened on Thursday, September 14. One of the most important aspects of this meeting was the development of several selected "White Papers" by expert physician groups. I will confess to some early apprehension when I saw that the meeting started with lectures at 8 a.m. These were to be presentations of the position papers or "White Papers" by five committee chairmen regarding the development of a proposed unified policy to be used by all Med Chi officers and members. Once these papers have been reviewed and passed by the Council, they will become official Med Chi policy, serving as an excellent and very useful resource for information, legislative testimony, and lecturing.

To my great relief and pleasure, the lecture hall quickly filled with members from all across the state and representing most specialties. None of these papers were of a clinical nature. They all spoke to the socioeconomic and legislative problems that we physicians face today. The lectures were outstanding and the members demonstrated great interest by their numerous and excellent questions after each presentation. Later, during the Council meeting, there was time to summarize and approve as policy several of these papers. The remainder of the papers, approximately ten, will be presented to Council at a special session on October 19, 1989 or at subsequent Council meetings.

Also during the Council meeting, the Policy and Planning Committee recommended that Med Chi develop a philosophy of membership that will include an Ad Hoc Committee to recruit specific target groups of physicians, such as academic, female, and FMG physicians. The Committee also will encourage the Student and Resident sections to involve the medical school Deans in our recruitment efforts. The Committee will comprise component membership committee members who will establish model guidelines for membership, as well as review the Bylaws for possible changes affecting membership.

The other major event at the Council meeting was the approval of a contract with the law firm of Rifkin, Evans, Silver, and Lamone to provide legal counsel and legislative representation to the Faculty. This contract includes a full-time "in-house" attorney for the Faculty who will guide day-to-day legal needs. We look forward to a long and productive relationship with this firm.

On Friday morning when the House of Delegates met all components were

The President's Letter

well represented. The various business aspects of the Faculty were attended to, including several bylaw changes that will be published along with a number of resolutions. If you ever doubted the democratic process in our organization, I recommend that you attend the next House of Delegates meeting.

The Clinical lectures for the entire program were well attended with very active participation by the audience. These lectures and their attendance by the membership was very gratifying as I was concerned that the business aspects of the meeting by Council and the House of Delegates might eclipse the rest of the meeting.

I believe the meeting was highly successful, and I am sorry if you missed it but hope you plan to attend future meetings to keep informed of the problems facing medicine. Most of the participants even had opportunities to enjoy the ocean and beach, which proved to be excellent at this time of year.

Raymond M. Atkins, MD
President

President's Bulletin on Hospice Care

In August 1989, the Medical Assistance Program informed the Faculty that it will cover hospice care for terminally ill Medicaid patients as an alternative to other covered services related to the active treatment of terminal conditions. The new hospice care benefit will be identical in most respects to the existing Medicare hospice benefit. For example, state-licensed hospice care agencies that participate in Medicare will functions as hospice providers.

In addition to the physicians directly involved in the hospice program, the patient's attending physician will have a significant role in the delivery of the patient's medical care. Other physicians will need to be aware of an individual's enrollment in hospice care, for the recipient will be restricted to obtaining any service related to the terminal condition from or through a designated hospice or from his / her attending physician.

Concurrent with the recipient's election of hospice care, the recipient would be enrolled in Medicaid's managed care program, with the designated hospice as the care manager. Therefore, for any bill to be paid on a hospice enrollee, the hospice's referral number must appear on the service provider's invoice.

For questions or more information regarding hospice care for Medical Assistance recipients, contact the Maryland State Health Department, Division of Program Services at (301) 225-5220.

The longer you look, the more we stand out.

Our commitment to provide local support and service for the nation's leading medical office computer system, THE MEDICAL MANAGER®, has made us the region's leading reseller for the last three years.

Our approach to client service is based on:

- THE MEDICAL MANAGER®, the most popular medical office computer system, with more than 7,000 installations nationwide.
- A network of three local offices staffed with experienced medical office management people and our own computer technicians.
- A system which includes any, or all, of the following:
  - ◇ Medical Billing
  - ◇ Clinical History
  - ◇ Electronic Claims
  - ◇ Scheduling & Recalls
  - ◇ Word Processing
  - ◇ Accounting

Interested? Call us for a list of references. Our clients can tell you about superior support and system performance.

November 1989

Committee Selections for 1990-1991

A committee selection card follows this Executive Director's Newsletter. Members interested in serving on a Med Chi Committee must mail this card to the Faculty in order to be considered for appointment to a committee.

New Law Firm for Med Chi

In September 1989 the Faculty entered into a contractual agreement with the firm of Rifkin, Evans, Silver and Lamone to provide legal services for Med Chi. The senior partners of the new firm include Med Chi's lobbyist, Gerard E. Evans, Judge Edgar Silver and former chief legislative officer to Governor Schaefer, Alan M. Rifkin, Esquire.

New Med Chi Faculty Position Papers

During the Med Chi Semiannual meeting in September 1989, the Council adopted committee papers on AIDS and on prescription drug control to be Faculty Position Papers. Papers on topics such as smoking, Medicaid, Medicare assignment, and the uninsured will be presented to Council in the coming months. Several of these position papers will appear in the legislative issue of the *Maryland Medical Journal* in January. For copies of any of the Faculty's Position Papers contact Med Chi's Public Relations Department at 1-800-492-1056 or 301-539-0872 in Baltimore.

Med Chi Resolutions

In September 1989, the House of Delegates passed new resolutions on anabolic steroids, medical care review, and communication between professional medical care groups. The House also reaffirmed the Faculty's position by passing several resolutions on topics including the Medical Assistance Program, Hepatitis B vaccines, and high quality medical care. To obtain a copy of any Med Chi resolution, contact Med Chi's Communications Department at 1-800-492-1056 or 301-539-0872 in Baltimore.

Semiannual Meeting Awards

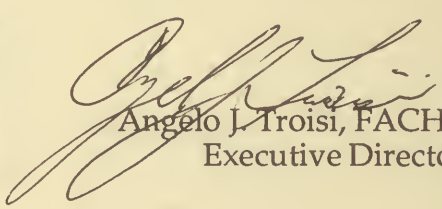
During the 1989 Semiannual Meeting in September, President Raymond M. Atkins MD presented a Certificate of Appreciation to the creators of Allegany Health Right, Inc., a nonprofit organization that provides free health care to people whose incomes are too low to cover costs of health insurance or medical services but too high to be eligible for government aid. The President also presented a Certificate of Appreciation to the physicians of the Allegany County Medical Society in recognition of the time and effort donated to Allegany Health Right, Inc.

Dr. Atkins also announced the winners of the Fourth Annual Media Awards for Excellence in Medical Journalism. Maureen

Curran of *The Montgomery Journal* won in the daily newspaper category for her article, "Treatment Offers Hope Over Bone Deformities." In the magazine and non-daily newspaper category, Robert Kanigel of *Science Illustrated* won for "Nicotine Becomes Addictive." Jamie Roberts of WJZ-TV won in the radio and television category for "Shocked Sober."

The third annual *Maryland Medical Journal* awards also were announced at the meeting. Carl I. Schoenberger MD, Jay H. Weiner MD, Frank J. May MD, Jeanne Spellman MD, and Robert G. Waltersdorff PhD, won the Practitioner's Best Article Award for their article, "Acute Pulmonary Histoplasmosis Outbreak following Home Renovation" (*MMJ*, June 1988). Charles Canady MD and Phillip J. Goldstein MD won the Resident's Best Article Award for "Elective Repeat Cesarean Section: Old Controversy, New Concepts" (*MMJ*, February 1988).

Medical Mutual Rate Reduction



The Medical Mutual Liability Insurance Society of Maryland will offer a 20% dividend credit for all Medical Mutual Members who renew their policies in 1990. This one-time credit is in addition to any other discounts which a member may be eligible to receive, according to an announcement made by Medical Mutual's President Raymond M. Yow MD at a press conference on October 12, 1989.

Dr. Yow also announced that the maximum charge for the Rate Stabilization Reserve Fund for all policies will be 15% as of January 1, 1990. This is down from the current maximum of 24% of premium.

Both the special dividend credit and the reduction in Rate Stabilization Reserve Fund are the direct result of the cumulative effects of tort reform and insurance legislation enacted by the General Assembly over the last several years. Medical Mutual is pleased to pass this financial relief along to its members.

AMA Awards Governor Schaefer

On October 3,1989, Maryland Governor William Donald Schaefer became one of the first recipients of the AMA's Dr. Nathan Davis Awards for Outstanding Public Service. Governor Schaefer was selected for his outstanding contributions in promoting the art and science of medicine and the betterment of public health in Maryland.

Angelo J. Troisi, FACHE
Executive Director

To effectively meet your needs as a Maryland physician, Med Chi must maintain an extensive framework of committees to uphold prior commitments, manage current programs, and formulate new policy. It is essential that these committees be comprised of interested members so that Med Chi will remain a strong, viable, and active organization.

Please indicate your willingness to serve by checking your committee preference and special interests on the reply card. Every effort will be made to appoint you to the committee of your choice.

I intend to appoint as many members as possible to committees to insure Med Chi's continued growth as the leading voice for medicine in Maryland.

Thank you for your support.

Reynaldo L. Lee-Llacer MD
President-elect

I am interesting in serving on the following Med Chi committees:

- ☐ Committee on AIDS
- ☐ Committee on Alcoholism and Chemical Dependency
- ☐ Committee on Computers in Medicine
- ☐ Committee on Continuing Medical Education Review
- ☐ Committee on Drugs
- ☐ Editorial Board *Maryland Medical Journal*
- ☐ Committee on Emergency Medical Services
- ☐ Finance Committee
- ☐ Committee on Hospital Medical Staffs
- ☐ Med Chi Insurance Fund
- ☐ Legislative Committee
- ☐ Liaison Committee with Medical Assistance Program
- ☐ Library and History Committee
- ☐ Long Term Care and Geriatrics Committee
- ☐ Committee on Managed Care and Third-Party Liaison
- ☐ Other Interests_____
- ☐ Medicine and Religion Committee
- ☐ Medicolegal Committee
- ☐ Committee on Mental Health
- ☐ Occupational Health Committee
- ☐ Peer Review Committee
- ☐ Physician\Patient Relations Committee
- ☐ Committee on Physician Rehabilitation
- ☐ Committee on Professional Ethics
- ☐ PRO Monitoring Committee
- ☐ Committee on Public Health
- ☐ Public Relations Committee
- ☐ Committee on Small Area Practice Variations
- ☐ Committee on Specialist Identification
- ☐ Committee on Specialty Societies
- ☐ Committee on Young Physicians

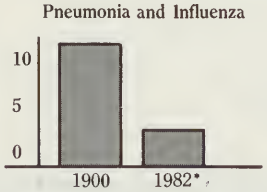
The Provider Network System – Bringing Solutions to Your Practice

CHE



Center for Health Education, Inc.

The Center for Health Education, Inc., a non-profit organization, was established on April 12, 1982 to be a resource to physicians in enhancing their disease prevention and educational skills. CHE originated as a joint venture of the Medical and Chirurgical Faculty of the State of Maryland (Med-Chi, the State Medical Society) and Blue Cross and Blue Shield of Maryland.

The concept for CHE began with Med-Chi physicians who recognize that traditionally, medical education does not emphasize the skills physicians need to successfully educate their patients. This concept was supported by Blue Cross and Blue Shield of Maryland, which acknowledges that successful patient education can have a positive impact on the utilization of health services.

Physicians and Disease Prevention

Physicians have been in the forefront of influencing the dramatic decline in premature deaths caused by infectious diseases.

Physicians can be just as effective today. Perceived by the public as the best and most reliable source of health messages, physicians can have a substantial impact on those lifestyle behaviors which, more so than ever before, significantly contribute to the causes of avoidable morbidity and premature mortality such as heart disease and cancer.

In addition, the physicians are in a position to personalize their advice for the individual patient, as well as reinforce those recommendations over time.

Source: National Center for Health Statistics.

Education for Health

Patient education is a process that provides people with information, encouragement and help in adopting healthful lifestyles and adhering to medical advice.

The use of patient education strategies and techniques can result in:

- increased compliance to medical advice
- positive changes in lifestyle habits
- improved patient satisfaction
- fewer broken appointments
- fewer complaints about medical care

Functions

RESEARCH: Assess physicians' needs in disease prevention and health promotion, their current practices and the obstacles they encounter in the educational process.

DEVELOPMENT: Design physician educational materials and programs to increase physicians' awareness, skills and expertise in patient education.

IMPLEMENTATION: Disseminate materials and conduct Continuing Medical Education programs to assist physicians in educating patients.

Accreditation

CHE has been found to meet the Essentials of Accreditation necessary to grant Continuing Medical Education credits for the American Medical Association's Physician Recognition Award.

Governing Body

CHE is governed by a Board of Directors.

Perspectives on Genetic Disorders

Carmine M. Valente PhD and Albert M. Antlitz MD

The authors, respectively Executive Director and Chairman, Board of Directors, of the Center for Health Education, Inc., acted as guest editors for this issue.

In the past few decades new genetic discoveries and technologies have been applied to medical practice. Once considered an academic-oriented domain, genetics now encompass the spectrum of medicine. The province of genetics is not confined to a few rare diseases or to congenital disorders. Many genetic disorders present in childhood; others may not be apparent until adulthood.

While recent genetic advances have been astonishing, the implication for greater physician involvement in the education, treatment, and care of individuals with genetic disorders is equally remarkable. More and more primary care physicians will be called on to provide care for patients with genetic disorders as well as their families.

The new genetic advances raise a host of ethical considerations for the medical profession. Issues relating to informed consent, confidentiality and disclosure, and the physician-patient relationship are becoming increasingly difficult to address. In fact, there is little consensus on these issues.

Advances in genetic research require financial support. We highlight the role the March of Dimes Foundation has played in the field with a brief review of its contributions to the understanding of genetic disorders by Beverly Raff PhD.

The articles beginning on page 901 represent a broad range of thought about genetics. The lead article by the internationally distinguished geneticist Victor A. McKusick MD provides the historical perspective on genetic disorders. Dr. McKusick is responsible for cataloging all genetic disorders known to man. He describes the development of the eight editions of *Mendelian Inheritance in Man* and traces that development from the print to computer form. He also discusses the evolution of genetics as a subspecialty in medicine.

In the next article, Nancy E. Maestri PhD and Joann A. Boughman PhD summarize the trends in population genetics and review the Baltimore-Washington Infant Study (BWIS), which is currently investigating etiologic factors in congenital heart disease.

Miriam G. Blitzer PhD and colleagues follow with the article on recent advances in genetics. Their article provides a review of some of the recent advances made in molecular genetics, biochemical genetics, and cytogenetics.

An article by Susan R. Panny MD and Barbara A. Bernhardt MS describes the availability of genetic services in Maryland. Information on genetic centers, support groups, and cost of genetic services also is provided.

Gaps in genetic services is the subject of the next article. Rita Beck Black DSW and Joan O. Weiss ACSW highlight findings from a national survey of genetic support groups. Initiatives to improve genetic service are discussed.

The next three articles involve various issues relating to the assessment of genetic disorders. C. Lynn Keene MD and Devereux N. Saller, Jr., MD provide information about prenatal genetic concerns. In their review they discuss family history analysis, prenatal ultrasonography, and concerns of advanced maternal age, among other issues. R. Stephen Amato MD identifies the common genetic problems

in children and addresses several misconceptions about genetic conditions. Reed E. Pyeritz MD reviews the common genetic disorders in adults and also dispels some of the misperceptions associated with genetic disorders of adulthood.

Barbara A. Bernhardt MS in her article on counseling and patient education states that "advances in the science of genetics will result in increased need for counseling services and more reliance on the primary care provider as a resource for genetic information." She reviews the process of genetic counseling and discusses barriers to effective counseling.

The concluding article by Robert Wachbroit PhD on the moral problem of who is the patient raises a number of ethical questions associated with the recent advances in genetics.

Support of Genetic Disorders

Beverly S. Raff PhD

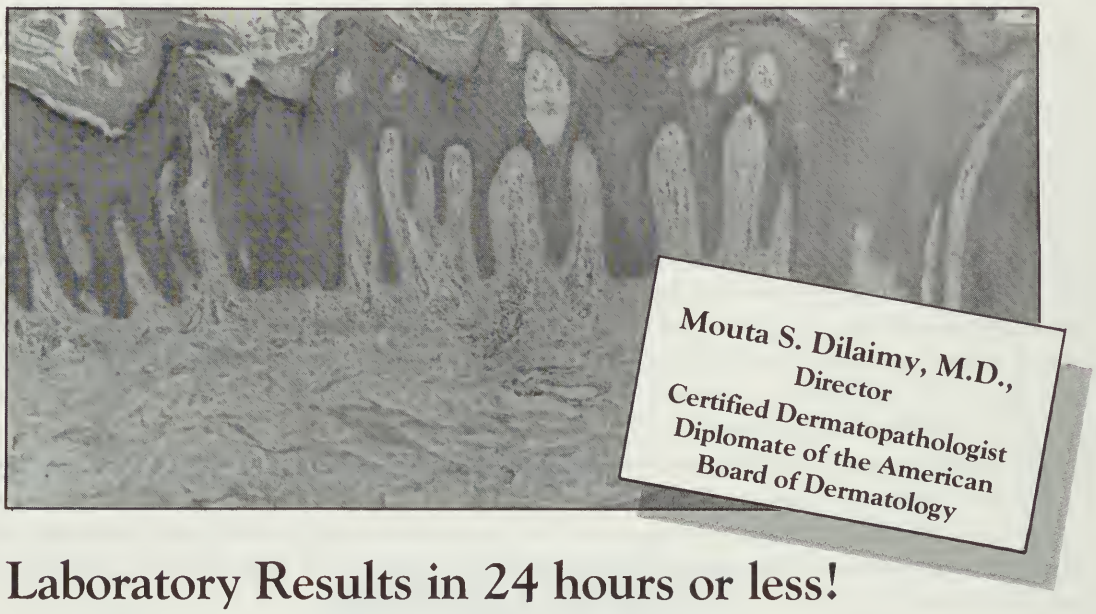
The author is Vice-president, Professional Education, March of Dimes Birth Defects Foundation, White Plains, NY (914-428-7100).

In its mission to prevent birth defects, the March of Dimes Birth Defects Foundations's involvement in genetics includes research, education, health services, and advocacy. Its commitment to support research is perhaps best exemplified by the contributions of Dr. James Watson. Dr. Watson, a member of the team that discovered the double helix structure of the DNA molecule, was supported by a March of Dimes (MOD) fellowship when he collaborated on that Nobel Prize winning achievement.

But victories in the research laboratory can save lives only when provision is made to translate them into practice, making treatment and prevention realities. In all its research involvement, the MOD has consistently helped bridge the gap between research success and effective, accessible medical service.

Support also is provided for a variety of health service programs, including carrier testing for female relatives of males with hemophilia and DNA-based diagnosis for sickle cell anemia. The MOD is a vigorous advocate for government support of and insurance reimbursement for genetic services, as well as advocating for the extension of the National Genetics Diseases Act.

The MOD supports the National Organization for Rare Disorders (NORD) and the Alliance of Genetic Support Groups. (NORD helps individuals and families affected with rare disorders, and the Alliance is a coalition of consumers and professionals representing those affected with genetic disorders.) Recently, NORD has expanded its rare disease database, which now provides information to more than 1,300 people each month.



The MOD has witnessed the expansion of the number of genetic services centers throughout the country from 10 to 100. It also provides support for national and international genetic conferences.

Last year, on its 50th anniversary, the MOD announced that one of its two new objectives will be to focus more attention on research to develop gene therapy. Currently, about 10 percent of its research grant money is related to gene therapy. The MOD will continue its work, supporting and maintaining the efforts that will lead to healthy births for all babies.

For additional information about the March of Dimes, call the Baltimore chapter at 301-752-7990 or the Washington, DC chapter at 202-872-0967. ■

MARYLAND MEDICAL LABORATORY, INC.

PROVIDING COMPLETE & COMPREHENSIVE DERMATOPATHOLOGY SERVICES

Laboratory Results in 24 hours or less!
(After Specimen Arrival)

Dermatopathology Services is a division of Maryland Medical Laboratory, Inc. one of America's largest medical laboratories. Dermatopathology Services is directed by board certified dermatopathologists and provides complete, comprehensive, histopathology services.

- Biopsy Procedures
- Immunofluorescence Procedures
- Monoclonal Antibodies
- Immunopathology (Direct and Indirect Immunofluorescence)
- Consultation with a Dermatopathologist
- Special Stains
- Slide Preparation
- Pick Up Service
- Teleprinting (To Qualified Clients)
- Complimentary Collection/Transport Supplied
- Insurance Assignments
- Complete, Clinical Diagnostic Testing Services

Historical Perspectives: The Understanding and Management of Genetic Disorders

Victor A. McKusick MD

Dr. McKusick is University Professor of Medical Genetics, The Johns Hopkins University School of Medicine, Baltimore.

In the last 30 years clinical genetics has become a defined specialty, and at the same time, genetics has been incorporated into the warp and woof of clinical medicine, every aspect and every specialty being involved.

Great advances have been made in the understanding and management of genetic disorders over the last 30 years. One can perceive those advances by reviewing the evolution of my gene encyclopedia *Mendelian Inheritance in Man* (MIM) from its conception in 1960. Going through eight print editions[1] and achieving in August 1987 worldwide online electronic accessibility, the "catalogs" record the development of the field of medical genetics during this period of greatest expansion.

Studying Human Chromosomes as a Clinical Procedure

The specialty of medical genetics really developed during the last 30 years. In 1959 the first chromosome abnormalities underlying clinical disorders (Down syndrome, Turner syndrome, Klinefelter syndrome) were identified. The ability to study the chromosomes under the microscope with relative ease was a major impetus for the development of medical genetics as a clinical specialty. It gave the clinical geneticist his (or her) organ; just as the cardiologist had the heart, the neurologist the nervous system, the gastroenterologist the GI tract, the clinical geneticist had the genome. Indeed, the ability to study the human chromosomes and to map the genes on the chromosomes represents the "new anatomy," and the information coming from it has provided a neo-Vesalian basis for all of clinical medicine, not just for clinical genetics.[2]

The catalogs do not discuss specifically the relatively gross chromosomal abnormalities represented by disorders such as Down syndrome, nor do they discuss specifically multifactorial disorders such as common malformations, hypertension, and coronary artery disease. However, especially in recent years, these topics also have been touched on by the catalogs as specific genes responsible for the phenotypic features of chromosomal aberrations have been identified, as minor chromosome abnormalities such as deletions of single bands have been identified in "Mendelizing" disorders, and as individual genes of significance in the causation of polygenic (multifactorial) disorders have been sorted out.

Thus, although one will not find in MIM the detailed charac-

teristics of the cri du chat syndrome or of trisomy 13, one will find oblique references to both these and other chromosomal aberrations in discussions of the genes that are located in those areas of the genome involved by the aberrations. Similarly, in multifactorial disorders, such as cleft lip/palate and coronary artery disease, one will find a discussion of multifactorial inheritance as a background for discussion of those single-gene mutations that have been identified as contributing to causation.

Early Days of the Catalogs

Although in recent years MIM has evolved into an encyclopedia of genes, it began in 1960 as a catalog of Mendelizing *phenotypes*, disorders and "normal" traits that show simple Mendelian pedigree patterns. Indeed, almost the only way we had in 1960 for identifying genes was through the behavior of phenotypes in families.

When the first print edition was published in 1966, the information was divided into three catalogs according to mode of inheritance: autosomal dominant, autosomal recessive, and X-linked. Within each category of inheritance individual phenotypes were given separate entries, which were alphabetized according to a preferred designation and then assigned a sequential four-digit number beginning with 1001 for the autosomal dominants, 2001 for the autosomal recessives, and 3001 for the X-linked traits.

The first of the catalogs to be assembled was the X-linked catalog, published separately in 1962.[3] Collection started in 1960 when I was studying the X chromosome intensively. The question was: What genetic information is carried by the X chromosome? A partial answer to this question is provided by a list of all the diseases that are X-linked; there were 68 definite and 51 possible X-linked traits listed in the 1966 edition. The list of X-linked disorders was like a photographic negative from which a positive picture of the genetic constitution of the X chromosome could be made. The fact that two forms of hemophilia were known to be X-linked indicated, for example, that at least two genes coding for factors important to coagulation are located on the X chromosome.

In late 1962, I began studies of the Old Order Amish,[4] a group in which, because of inbreeding, I expected to find autosomal recessive disorders. Indeed, we expected to be able to characterize "new" recessive disorders. To recognize the new ones, one needed to know the old ones. Therefore, I undertook a comprehensive catalog of autosomal recessive traits. In early 1964, for sake of completeness, I initiated a catalog of autosomal dominants, this with some hesitation because of the readiness with which the label, "autosomal dominant with reduced penetrance and variable expression," was placed on a host of characteristics. The problem was aided, however, by the creation of two classes of citizens in each catalog: those in which a particular mode of inheritance seemed well established were honored with an asterisk, whereas those of more uncertain status were left without an asterisk, although they were included for heuristic reasons.

Computerization

In 1964 at the urging and with the assistance of David Bolling, the catalogs were computerized. A great virtue of the computer was that new errors were not introduced each time the catalogs were retyped to accommodate additions and revisions. Furthermore, the computer was useful in creating the author and subject indexes and in preparing camera copy for publication, for example, right margin justification.

The catalogs have appeared in eight editions: 1966, 1968, 1971, 1975, 1978, 1983, 1986, and 1988. As shown in Figure 1, the number of entries has gone from 1,487 (in the first edition) to 4,344 (in the eighth edition) and to more than 4,800 (in the continuously updated, online version, OMIM). The publication schedule for the foreseeable future follows the pattern established with the seventh and eighth editions of 1986 and 1988, that is, every other year in even-numbered years. The computer file is closed March 1 of the year of publication, and books are available July 1, a useful feature in this rapidly moving field.

Publication has been computer based from the beginning; MIM was a pioneer in computer publication. The first three editions were photo-offset, using camera copy generated by the printer attachment of the computer; they were all "uppercase." Beginning with the fourth edition (1975), we have used the electronic medium for what amounts to automatic typesetting. This results in standard type style and in economy of page space, a significant factor because of the expanding information. Thus the fourth edition is smaller than the preceding edition because of the economy of space. With the eighth edition we went to 8 1/2 by 11 page size, double columns, and bible paper

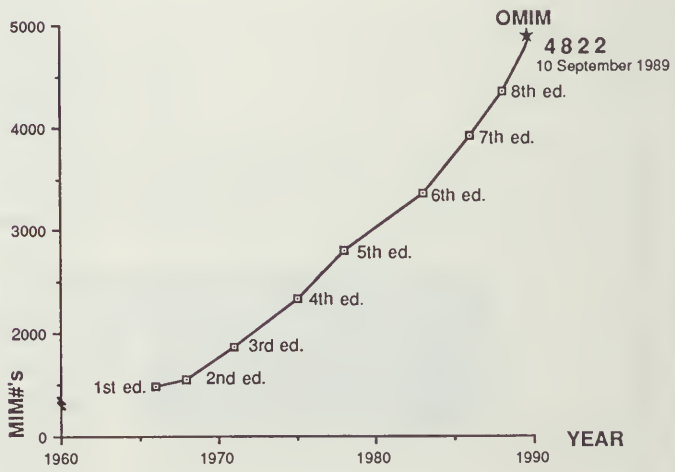

Figure 1. Growth of Number of Entries in MIM

to accommodate the increased volume of information. It will be possible to keep MIM within the bounds of a single volume for probably only one more biennial edition.

The value of computerization to the maintenance of the encyclopedia is evident from several points of view. The author index lists over 50,000 separate authors; the total number of references is in excess of 32,000. The foreword and appendices, such as the Human Gene Map and the list of Molecular Defects in Mendelian disorders, were done by computer-based photocomposition for the first time with the eighth edition; they had been set in type previously. Think of the help that the computer would have been to Sir James Murray (1837-1915) who spent 35 years writing out the definitions of words beginning with each of 16 letters, for the Oxford English Dictionary! Sometimes I feel like Murray; Diderot and the other French encyclopedists may be closer parallels.

Since August 1987, MIM in its continuously updated form has been available worldwide from the Welch Medical Library at Johns Hopkins via the Telenet public data network and Internet. Information on access to the online version, called MIM, is available from Bonnie L. Maidak PhD, Welch Medical Library, Baltimore, MD 21205 (301-955-9656).

The online version of MIM has the obvious advantage of timeliness; material added today in Baltimore (and the file is updated daily) is available tomorrow worldwide. The second advantage comes from the search routine called IRx developed on an experimental basis by the group at the National Library of Medicine working with MIM as a "testbed." The database is sufficiently large that an ordinary print index cannot suffice. With IRx, one can type in a given word or combination of words (in a boolean arrangement, for example) or a given surname, and almost instantaneously the computer screen will display a list of all those entries in which the word, combination of words, or surname appears. Individual entries then can be searched. IRx can be used, for example, for differential diagnosis; if one puts in a list of signs and symptoms, OMIM will give a list of conditions displaying those features.

Map of Genes

A function of *Mendelian Inheritance in Man* has been maintenance of information on the human gene map. The linear arrangement of genes on our chromosomes is part of our anatomy. The information is referred to as "the human gene map," a cartographic metaphor, but an anatomic metaphor would be equally appropriate. The growth of this information over the last 21 years is shown in Figure 2. By 1968 when the first gene, that for a blood group (Duffy), was mapped to a specific autosome (nonsex chromosome),[5] we knew at least 68 genes were on the X chromosome. Since then the mapping of genes has progressed at an ever-accelerating pace, thanks to the development of new

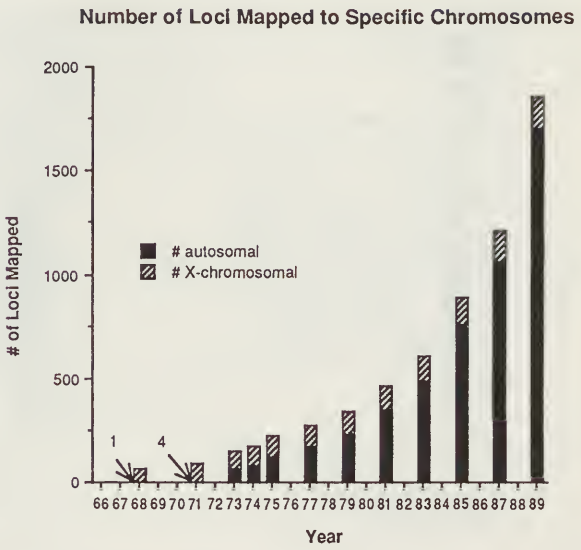

Figure 2. Growth of Information on the Human Gene Map

cellular and molecular (recombinant DNA) methods of study. Today we know the chromosomal location of over 1,800 genes, although we have a long way to go to complete the mapping of all 50,000 or more genes the human is thought to carry in each nucleated cell of the body.

The third (1971) edition of MIM was the first one to give information on the human gene map. One printed page sufficed for the information, some of which is now known to have been in error. In the eighth (1988) edition, 78 closely printed pages were required for the information (which we believe is for the most part secure).

A "morbid map," or pictorial representation of the "morbid anatomy of the human genome,"[2] can be derived from the map information. Many diseases such as cystic fibrosis and Huntington disease have been mapped to specific chromosome sites (rather, the gene carrying the mutation that causes each has been mapped) by finding linkage to markers of known locations. In many other instances such as Tay-Sachs disease, we know the location of the disease-producing mutation because the normal (wildtype) gene has been mapped. Figures 3 and 4 present maps of chromosomes 4 and 7, respectively.

Gene mapping has become of significance to all aspects of medicine because it opens the possibilities of diagnosis by specific gene methods and of elucidating the nature of puzzling disorders such as Alzheimer disease, Huntington disease and cystic fibrosis by going directly to the gene, finding what it normally does, and finding out what is "wrong" with the gene in the mutant form that produces disease (Figure 5). This last process is referred to as "reverse genetics."

As I write, articles are appearing in *Science* announcing the discovery of the cystic fibrosis gene (CF).[6-8] This was made possible by first mapping the gene to

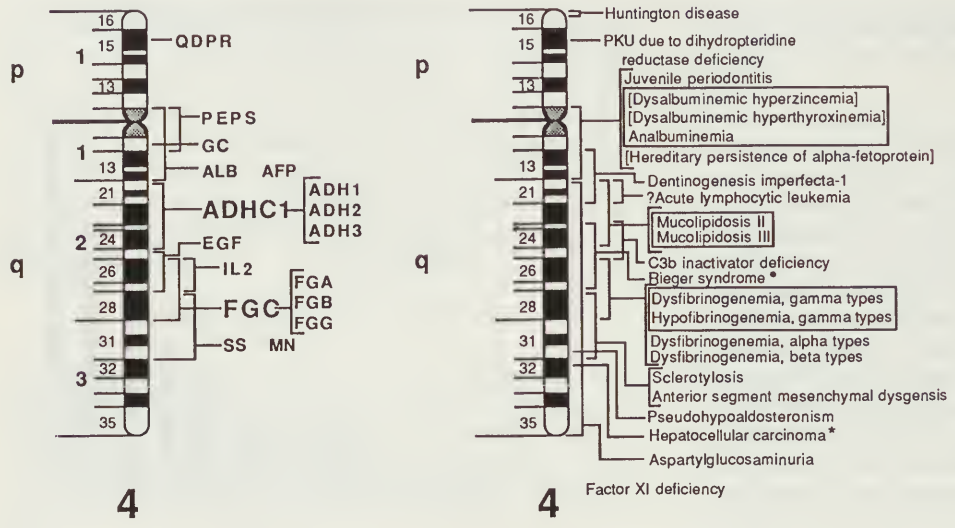

Figure 3. Chromosome 4

A. Location of selected genes of interest, including: EGFR = epidermal growth factor receptor; EPO = erythropoietin; COL1A2 = alpha-2 collagen; MET = oncogene MET; TCRB and TCRG = beta and gamma subunits of T-cell antigen receptor.

B. The morbid anatomy of chromosome 7. The disorders in the box are allelic, i.e., are caused by different mutations in the gene coding for the alpha-2 polypeptide of type I collagen.

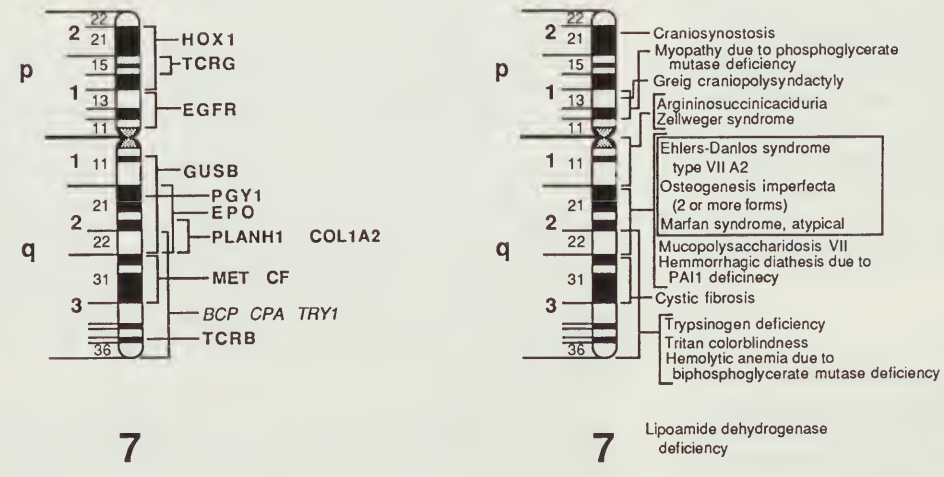

Figure 4. Chromosome 7

A. Location of selected genes of interest including: GC = vitamin-D binding protein; ALB = serum albumin; AFP = alpha-fetoprotein; ADH = alcohol dehydrogenase (3 clustered genes); EGF = epidermal growth factor; IL2 = interleukin 2; FG = fibrinogen (3 clustered genes); SS and MN = MNSs blood group(s).

B. The morbid anatomy of chromosome 4. The disorders enclosed in boxes represent allelic phenotypes, i.e., disorders due to different mutations in the same gene. Brackets indicate a "nondisease."

the long arm of chromosome 7 (7q) by the finding of chromosome 7 markers that are closely linked and then "walking" and "jumping" along chromosome 7 until a segment of DNA answering to the expected characteristics of the CF gene was encountered. It turns out that the CF gene is a big one (at least 150 times bigger than the biggest hemoglobin gene) and about 70 percent of CF patients have a well-pinpointed lesion, like that in sickle cell anemia; a single amino acid (No. 508, phenylalanine) has been deleted in the mutation that leads to CF. This discovery is a particular triumph for "reverse genetics" based on gene mapping.[2] The genes for Duchenne muscular dystrophy, retinoblastoma, and chronic granulo-matous diseases also have been isolated by first mapping the genes to specific chromosomal sites and then searching them out, but in all these instances patients with microscopically visible deletions or rearrangements of the particular chromosome were available. Cloning the genes was, relatively speaking, easier under these circumstances; it was much more difficult when the mutation involved a single amino acid in the product protein. It was like looking for a needle in a haystack; only three out of three billion nucleotides were deleted.

Fundamental Biochemical Defects in Genetic Disorders

Another function of *Mendelian Inheritance in Man* is maintenance of a list of molecular defects in Mendelian disorders. In any genetic disorder it is desirable to know the basic biochemical defect, that is, what enzyme is deficient or defective or what other protein is altered. This information is now available for about 430 Mendelian dis-

orders. This list correlates with the "morbid map" because information on the biochemical defect tells us a given disease maps to the site that has been determined for the normal gene coding a particular enzyme or other protein. The list includes information also on the intragenic lesion (the precise nature of the gene mutation) when known.

The Human Gene Map and the list of Molecular Defects in Mendelian Disorders are totally integrated with the main file of OMIM just as they are appendices to the print version of MIM. If one is reading about a given disorder, let us say von Recklinghausen neurofibromatosis (NF1), one can ask, Has this gene locus been mapped? By pressing the "M" on the keyboard, instantaneously the portion of the map dealing with the proximal part of the long arm of chromosome 17 appears on the screen with an arrow indicating the position of the NF1 locus. Alternatively, if the locus has not been mapped, the questioner is so informed. One can ask what other genes are on the long arm of chromosome 17.

Similarly, by pressing "Z" on the keyboard, one can ask, Has the molecular defect in this disorder been identified? If the defect is known, as in a condition such as Duchenne muscular dystrophy or hemophilia A, the relevant part of the molecular defects list appears on the screen. If one is reading about a given enzyme or other protein, such as adenosine deaminase, one can ask, Has a disorder been related to a deficiency or defect of this protein? In the example cited, OMIM would tell the inquirer that severe combined immunodeficiency results from mutation in this gene.

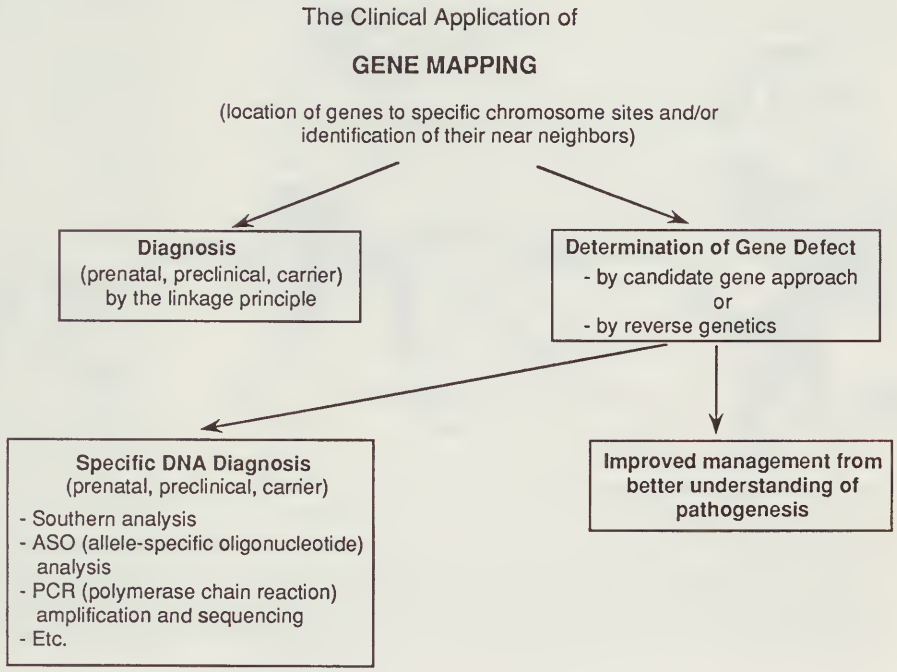

Figure 5. Why Map Genes?

Organization

The numbering system for entries in MIM used four digits for the first two editions. Entries in the first edition were numbered consecutively, the fundamental organization being according to alphabetical order in each of the three catalogs; as previously stated the initial digit in the autosomal dominant, autosomal recessive and X-linked catalogs was 1, 2, and 3, respectively. With the second edition, a renumbering was done when we went to press; thus, the numbers of many disorders were changed. With the third edition, we took steps to achieve a relative permanence of the MIM numbers by adding a zero to the four-digit number used in the second edition; we thus achieved a considerable number of new entry numbers for assignment. This system has sufficed until recently; we are shortly adding a zero to all entry numbers, thus going to a six-digit system.

Each entry in MIM is given a preferred title for the particular locus or phenotype coded at that locus – at least the designation that was preferred at the time the entry was created. In parentheses after the preferred title are synonyms, gene symbols, and inclusive terms, for example, the names of diseases determined by mutations at that locus in cases in which the primary designation is the gene product. If the originally preferred designation falls from favor, it is usually retained unless there is some exceedingly compelling reason to change to a new designation; this is to preserve the unique numbering system, the rationalization being that the provision of synonyms will suffice for finding the given entry through either the index of the print version or the IRx search of OMIM.

The title is followed by text based on information from the literature, information from my personal experience, and information obtained by personal communication from colleagues – mainly information from the periodical literature. Material we have considered important for the write-up includes description of the phenotype (the disorder); evidence for the particular mode of inheritance and description of peculiarities in the genetics; the formal genetics in terms of genetic mapping, gene frequencies, selection, and ethnic distribution; information on the nature of the basic defect and pathogenetic mechanisms; and finally management, especially when the treatment is

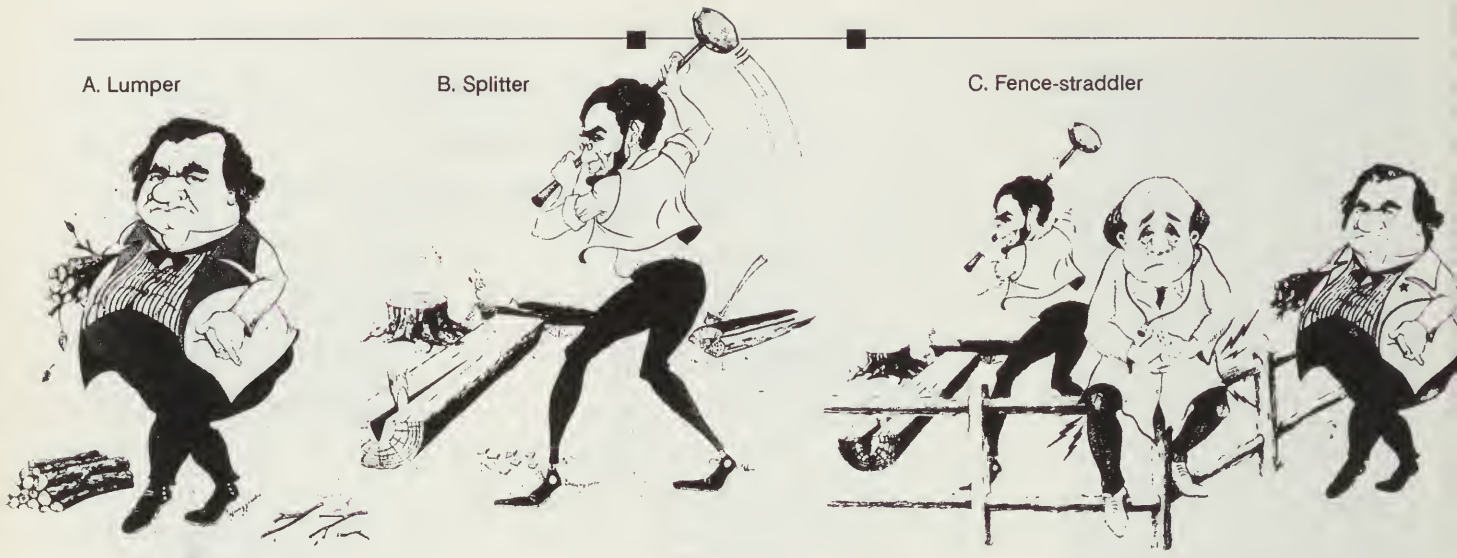

Figure 6. The Three Nosologists

The cartoons illustrate that splitting is harder work than lumping. They also illustrate that fence-straddling is uncomfortable but sometimes necessary. Based on the well-known cartoons shown in A and B, J.M. Opitz and R.B. Lowry referred to the controversy between splitting and lumping as "Lincoln vs. Douglas Again" (Editorial, Am J Med Genet 1987;26:69-71). (Cartoon C, courtesy of C.E. Jackson, Detroit.)

based rather specifically on the gene-determined pathophysiologic changes, for example, dietary therapy in PKU. Matters of genetic counseling, often implicit in the other material included, are explicitly discussed when warranted by published studies.

For the most part, the text of the entries is organized chronologically. In most cases, no systematic effort has been made to put together the information on mapping, for example, which might come from papers spanning two decades or more. Some entries have become moderately unwieldy, and paragraphing has been undertaken. But most of the entries have been left as they have accumulated over the years, with new accessions being added at the end of the previously existing text. Whatever the disadvantages, the system has the advantage of showing the historical development of knowledge in the field.

For the first 20 years or more, MIM entries were created exclusively on the basis of delineation of phenotype; this is the only way we had to identify genes. The phenotype might include a biochemical phenotype such as deficiency or alteration in a protein, enzymatic or otherwise, but not until recently has it been possible to create entries on the basis of genes themselves. In the last few years, genes encoding specific proteins have been cloned by working back from the messenger RNA, that is, creating a so-called cDNA (complementary DNA). As a result, the genes have been sequenced and even mapped to a specific chromosomal site before there is knowledge of any Mendelizing phenotypic variation at the locus. If MIM purports to be a gene encyclopedia, such entries deserve to be in it.

Some genes uncovered by cell biology and molecular genetics are ones we had no inkling of 30 years ago; for example, oncogenes, the genes that normally have important functions in development and differentiation but when mutated cause cancer. Indeed, mapping genes has brought forcefully to attention the fact that *all neoplasia is genetic disease*. For uncontrolled growth of cells to develop, change in DNA (the genes) must occur. Small cell cancer of the lung is a striking example. This neoplasm, which represents about one-fourth of lung cancer, is as intimately related to cigarettes as any other form of lung cancer, but the fundamental "cause" is a change in gene(s) on the short arm of chromosome 3 (3p), which appears to be a necessary, even though perhaps not sufficient, event in this particular carcinogenesis.

Lumping and Splitting

Identification of genetic heterogeneity has played a big role in the creation of the catalogs. As I have pointed out in the past,[9] nosologists tend to be either splitters or lumpers (Figures 6A and B) or sometimes fence straddlers (Figure 6C). By and large, medical geneticists must be splitters because the rule is that when a given phenotype, such as muscular dystrophy, mental retardation, retinitis pigmentosa, or congenital deafness, is subjected to close scrutiny, one finds that in fact one is dealing with a number of distinct entities. The increase in the number of entries represented by the graph in Figure 1, represents not so much the identification of new major phenotypes but rather the identification of different causes of the same phenotype. The delineation of genetic heterogeneity was aided greatly by advances in biochemical genetics that identified different enzyme defects, for example, in inborn errors of metabolism that clinically seem roughly the same.

However, there also has been a "lumping" process

going on in recent years, when it is found that two or more seemingly quite unrelated phenotypic entities in MIM are due to alleles of one and the same gene. Thus, we had separate entities for a number of forms of amyloid polyneuropathy, such as the Portuguese (or Andrade) type and the Indiana (or Rukavina) type, but these turned out to be different mutations in the gene that codes for prealbumin (also called transthyretin because it is the major carrier protein for thyroxine). Following the principle of one locus – one entry, these several forms of amyloid polyneuropathy have been moved together, but we have adopted a system of giving each clinical type a separate paragraph within the prealbumin entry.

Prealbumin illustrates another aspect of lumping. An entry was created for the prealbumin protein on the basis of rare variations in the protein that alter its binding of thyroxine to result in familial euthyroidal hyperthyroxinemia. Later, the prealbumin gene was cloned, sequenced, and mapped to chromosome 18 and this, too, was a legitimate basis for an entry in MIM. In OMIM presently (and this will be the case in the ninth printing) a single entry with the lead-off designation PREALBUMIN encompasses information previously scattered through five or six separate entries.

An earlier example of lumping came with the hemolytic anemias due to specific red cell enzymopathies. Entries might be created on the basis of discovery of an electrophoretic polymorphism of a red cell enzyme in clinically normal individuals. Deficiency of the same enzyme might later be identified as the cause of hemolytic anemia and receive a separate entry if it were not appreciated that these were one and the same gene locus, that is, several phenotypes, "normal" and pathologic, resulting from alleles.

It might be said that in assembling the catalogs, we take thirty steps forward and one step backward. By that I mean that for each thirty new entries created through the process of phenotype-splitting (or gene cloning), one is deleted (usually folded into another entry because it is found to relate to a previously existing entry).

Cataloging Mutational Lesions within Genes

As molecular genetics has probed more deeply into the nature of the lesions in the genes underlying particular disease phenotypes such as hemophilia and muscular dystrophy, it turns out there are many different lesions within the gene that can result in the same or a very similar phenotype, for example, many different lesions of the Factor VIII gene that result in hemophilia A. The lesion may be as small as a single nucleotide change or as large as deletion of the entire gene. Keeping track of the different allelic mutations responsible for a particular disorder is acquiring practical significance as well as a substantial theoretical importance. One reason is that specific gene diagnosis usually depends on the nature of the particular DNA lesion. This can vary widely from case to case. For example, over 70 different lesions of the beta-globin gene can lead to beta-thalassemia (H. Kazazian, personal communication). Storage of this information as it accumulates is a function of OMIM, as part of the list of Molecular Defects in Mendelian disorders.

Catalog of Phenotypes vs. Catalog of Genes

To this point we have learned that some disorders can be produced by two or more separate gene loci and, conversely, that two or more very disparate disorders may be caused by different mutations at the same locus.[2] As illustrated by Figure 7, in the cases of hemoglobin and type I collagen (to cite two examples), one sees a combination of these two principles. The alpha and beta loci encoding the two kinds of subunits of adult hemoglobin are located on chromosomes 16 and 11, respectively; and the alpha-1 and alpha-2 loci encoding subunits of type I collagen are located on chromosomes 17 and 7, respectively. Mutations at either one of the two collagen loci may cause any one of several types of osteogenesis imperfecta or of Ehlers-Danlos syndrome, and different mutations at either of the two beta-globin loci can cause thalassemia, Heinz body anemia, polycythemia or methemoglobinemia. To maintain the integrity of the one gene locus – one MIM entry rule, it is necessary to make the gene locus, not the disorder, the primary designation. In some cases, where there is considerable phenotypic and genetic information about a particular form of osteogenesis imperfecta or Ehlers-Danlos syndrome,

	Heinz body hemolytic anemia	Thalassemia	Erythremia	Methemoglobinemia
HBA	e.g., Hb Toyama Hb King County	α - thalassemias Mainly deletion types	e.g., Hb Chesapeake	HbM (several types) e.g., HbM (Boston) HbM (Kankakee)
HBB	e.g., Hb Köln Hb Hammersmith Hb Bristol	β - thalassemias Deletion and non-deletion types	e.g., Hb Osler	HbM (several types) e.g., HbM (Saskatoon)

Figure 7. Hemoglobinopathies

Any one of at least four different types of disorders can result from mutations in either of the genes coding for subunits of adult hemoglobin. (On the other hand, sickle cell anemia is the result exclusively of a change in the beta chain.) HBA = gene for alpha chain of adult hemoglobin; HBB = gene for beta chain of adult hemoglobin.

for example, a separate entry (without an asterisk) may be retained, even though we recognize that mutations at any one of two or more loci may cause the particular disorder. We must depend on the indices (print and computerized IRx) to find phenotypes desired. In clinical medicine it is, of course, the phenotype that is of primary interest.

New entries, created on the basis of cloned genes for which no Mendelizing phenotype has been yet identified, have been placed arbitrarily in the dominant catalog. The continuation of the system of putting all allelic mutation at a given locus in the same entry, regardless of whether the phenotype is dominant or recessive, may create trouble for those who do not read the information carefully. Some people were confused by the fact that sickle cell anemia was discussed in the dominant catalog (under the beta-globin gene) rather than in the recessive catalog. In the fullness of time, the print version of MIM can be expected to fill many volumes, at least as many as there are chromosomes, and organization by chromosome probably will be the logical system used in the ultimate gene encyclopedia.

The Specialty of Medical Genetics

There are differences in the workup of genetic disorders today as compared with 40 years ago. When I began my work in medical genetics[10] the only specific genetic technique was the construction of the family pedigree chart. Ten years later the study of chromosomes was just coming in, and a very modest array of techniques, for example, starch gel and other forms of electrophoresis, were beginning to permit definition of biochemical defects. Neonatal screening for disorders such as PKU and hypothyroidism (conditions that if caught early can be helped greatly by treatment) was getting under way 30 years ago. Prenatal diagnosis by amniocentesis started about 25 years ago, and prenatal diagnosis by chorion villus sampling was not added until this decade. Gene diagnosis was not part of even our wildest projections 15 years ago.

One can do so much more diagnostically today. Chromosome studies by the banding methods are much more revealing than were earlier methods. "Metabolic screens," that is, batteries of chemical tests on urine and blood, have been devised to detect peculiarities in puzzling cases of possibly genetic disorders. The genetic counselor is thus provided with much firmer grounds on which to base advice.

It is worth tracing the origins of medical genetics as a specialty during these 40 years, but especially since 1959. First, here are some definitions:

Genetics = the science of biologic variation

Human genetics = the science of biologic variation in humans

Medical genetics = the science of biologic variation as it relates to health and disease in humans

Clinical genetics = the science and art related to the diagnosis, prevention, and treatment of genetic disorders in individual patients and their families

It can be argued that medical genetics is a broader concept than human genetics because it encompasses not only all aspects of human genetics but also an enormous body of information related to the many hereditary disorders.

Clinical genetics has become institutionalized as a specialty, with its own board examinations (first given in 1980) and other accoutrements. The American Board of Medical Genetics (under the auspices of the American Society of Human Genetics) is an unusual board in that it certifies the entire clinical genetics team: clinical geneticists (who may be MDs, DOs, or DDSs), PhD medical geneticists, clinical cytogeneticists, clinical biochemical geneticists, and genetic counselors. The board also set standards for training programs.

As recently as 1975, I expressed a view that there is no need for a board of medical genetics.[11] It was my feeling, in part, that medical genetics would be practiced exclusively in medical centers where groups of subspecialists devoted to various aspects of genetic diagnosis and treatment could be concentrated. Such centers, by and large, have other means of maintaining standards not available in the solo practice setting. That genetics cuts across all aspects of medicine was also in my mind. However, a different view prevailed and rightly so, in my present view. I failed to appreciate the extent to which third-party payers, governmental and nongovernmental, need to have certification of the competence of the payee.

I am delighted by the extent to which clinical genetics has become a defined specialty. Furthermore, I am delighted by the extent to which genetics has been incorporated into the warp and woof of clinical medicine, every aspect and every specialty being involved.

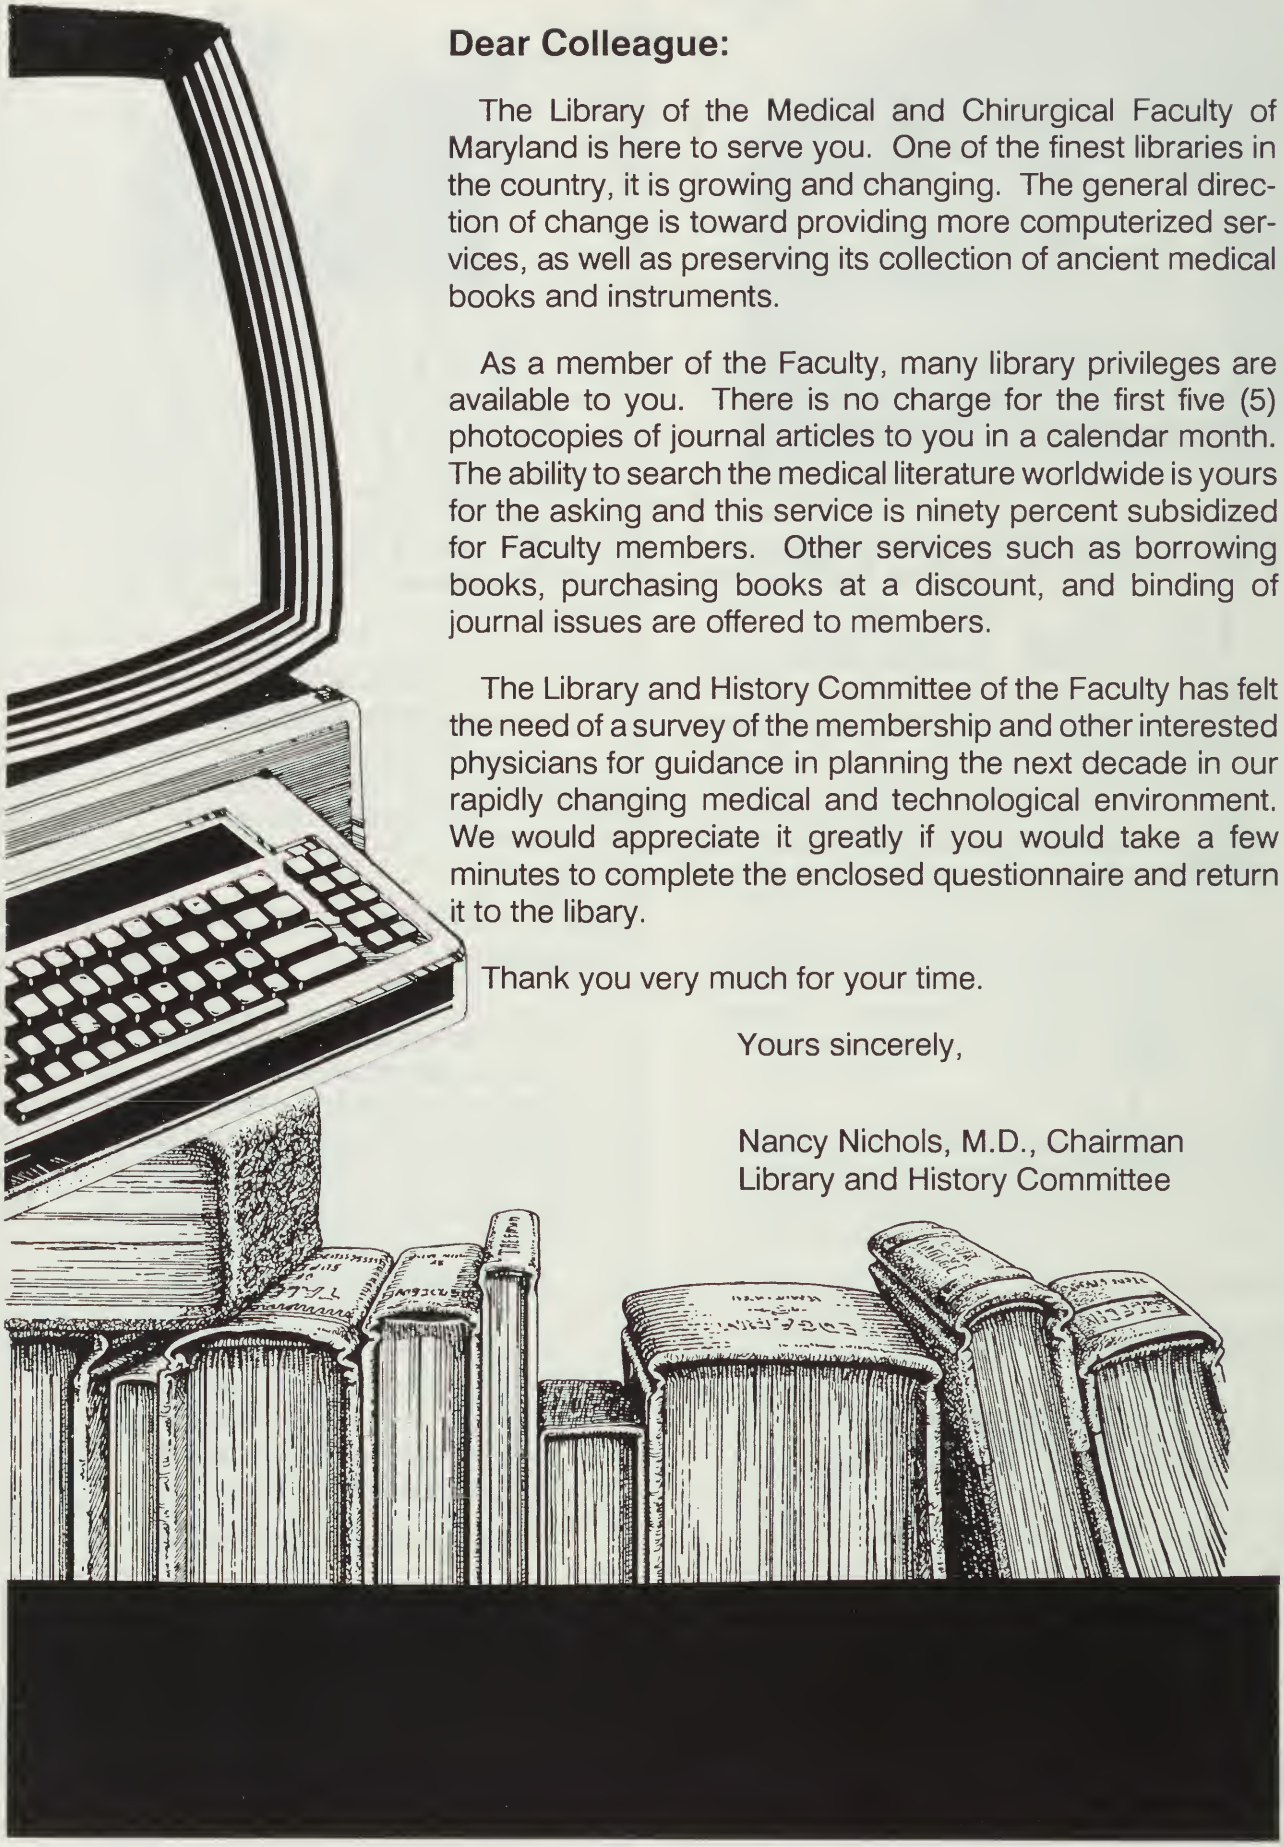
MERCY MEDICAL CENTER



in formal affiliation with the
Department of Psychiatry
of the University of Maryland
School of Medicine
is pleased to announce the
opening of the new

MERCY CENTER FOR EATING DISORDERS

Individualized inpatient, outpatient and day-treatment programs are offered utilizing a comprehensive multidisciplinary approach. Additionally, through an active research component the program will attempt to further the understanding of the underlying mechanisms involved in the development of these serious illnesses.

Harry A. Brandt, M.D., formerly Chief of the Eating Disorders Unit at the National Institute of Mental Health has been named the new medical director of the Mercy Center for Eating Disorders.

Telephone: (301) 332-9800

Dear Colleague:

The Library of the Medical and Chirurgical Faculty of Maryland is here to serve you. One of the finest libraries in the country, it is growing and changing. The general direction of change is toward providing more computerized services, as well as preserving its collection of ancient medical books and instruments.

As a member of the Faculty, many library privileges are available to you. There is no charge for the first five (5) photocopies of journal articles to you in a calendar month. The ability to search the medical literature worldwide is yours for the asking and this service is ninety percent subsidized for Faculty members. Other services such as borrowing books, purchasing books at a discount, and binding of journal issues are offered to members.

The Library and History Committee of the Faculty has felt the need of a survey of the membership and other interested physicians for guidance in planning the next decade in our rapidly changing medical and technological environment. We would appreciate it greatly if you would take a few minutes to complete the enclosed questionnaire and return it to the libary.

Thank you very much for your time.

Yours sincerely,

Nancy Nichols, M.D., Chairman
Library and History Committee

PHYSICIAN QUESTIONNAIRE FOR MED-CHI LIBRARY GUIDANCE

1. In the past 12 months, how many times have you used a medical library?_____

2. Of all the medical literature you read, what percentage is from the following:

Library Loans	_____%	Books You Have Purchased	_____%
Journals Subscriptions	_____%	Reprints of Articles	_____%

3. Does your hospital have a library? Yes ( ) No ( ).

4. What type of library do you use? (approx. percent.):

Hospital Library	_____%	Med-Chi Library	_____%
Nat'l Lib. Med.	_____%	Other	_____%

5. In the past year, for what purpose have you used your medical library? (approx. percent. of time):

To review literature on a medical problem in your practice	_____%
To prepare for a talk/article	_____%
For education, e.g. in preparation for board exams	_____%
Other	_____%

6. Do you own a computer? Yes ( ) No ( )

7. Have you ever used a computerized bulletin board? (Receiving and sending mesages by computer.) Yes ( ) No ( )

8. Would you be interested in using the Faculty's computerized bulletin board (named Med-Sig)? Yes ( ) No ( )

8A. If Yes, are you interested in using the bulletin board for any of the following:

Computerized literature searching	Yes ( ) No ( )
Obtaining reprints	Yes ( ) No ( )
CME accredited programs	Yes ( ) No ( )
Review announcements	Yes ( ) No ( )
Communication with the Faculty staff	Yes ( ) No ( )
Communication with other physicians	Yes ( ) No ( )

9. Do you have access to a FAX machine? Yes ( ) No ( )

9A. If yes, would you be interested in receiving reprints from the library via FAX? Yes ( ) No ( )

10. The Med-Chi library has begun to reduce the acquisition of standard medical texts in favor of highly specialized text and journals.
Do you agree with this policy? Yes ( ) No ( )

10A. If no, why not?_____

_____

_____

11. How useful do you find the services available through the Med-Chi Library:

	VERY USEFUL	SOMEWHAT USEFUL	NOT USEFUL
Book loans	_____	_____	_____
Literature Searches	_____	_____	_____
Reprint of Articles	_____	_____	_____
The rare book and instrument collection	_____	_____	_____
The music in medicine collection	_____	_____	_____
Computerized bulletin board (Med-Sig)	_____	_____	_____
Using the library at Med-Chi	_____	_____	_____

12. Please add any general comments you might have which would help the Library and History Committee in planning:

Demographic and Epidemiological Perspective on Genetic Disorders

Nancy E. Maestri PhD and Joann A. Boughman PhD

Dr. Maestri is a postdoctoral Fellow and Dr. Boughman is Associate Professor, Division of Human Genetics, Departments of Obstetrics and Gynecology and Pediatrics, University of Maryland School of Medicine, Baltimore. *The Baltimore-Washington Study is supported by the National Institutes of Health, National Heart, Lung, and Blood Institute, Grant #R37IIL25629.*

The study of genetic disorders from the demographic and epidemiologic perspective focuses on the evaluation of the frequencies and the issues of heterogeneity and variability of these disorders among populations. The explanation of genetic etiologies has become more complicated than the original description of the inheritance of the classical dominant, recessive, and x-linked disease.

Characteristic differences in gene frequencies between populations composed of varying racial and ethnic groups are well established. It is now understood that genetic etiologies have become more complicated than the original description of the inheritance of classical dominant, recessive, and X-linked disease. Advanced computerized analysis is required for testing hypotheses about genetic factors in familial disorders, especially in the presence of environmental covariation. Recently, emphasis has been placed on the investigation of heterogeneous genetic etiologies for the very common familial disorders such as heart disease, cancer, and birth defects.

The discipline of medical genetics concentrates on the diagnosis, treatment, and counseling of individuals and families with genetic disorders. An understanding of the clinical variability of individual genetic diseases is crucial to patient and family care. Genetic heterogeneity (several different genetic causes of similar clinical phenotypes) may contribute to this variability and thus is important in accurate diagnosis, prognosis, and risk assessment (for example, dominant and recessive forms of profound hearing loss).

The different approaches of analytical and population genetics are important in illustrating the role of genes in families and large population groups. Analytical genetics focuses on testing hypotheses regarding modes of inheritance, whereas population or epidemiologic genetics examines the frequencies of genes and disorders across populations. Population investigations permit the assessment of frequencies of disorders, and therefore, the population impact of these diseases. Investigation of large numbers of cases and their relatives permits the determination of the mode of inheritance and careful evaluation of both heterogeneity and variability. In addition, studies of traits in large numbers of families permit identification of potential covariates or risk factors that may enhance, exacerbate, or increase risk to certain in-

dividuals, families, or ethnic groups. Thus, the results of analytical and population genetic studies have an important impact on the practice of clinical genetics as well as preventive medical care.

Early studies of human genetic disease were limited to observing discrete, qualitative traits that follow Mendelian rules of inheritance. Single-gene Mendelian disorders are responsible for a significant proportion of human morbidity and mortality. We briefly discuss the distribution of some single-gene Mendelian disorders and then focus on newer methods being used to elucidate the etiology of more complex diseases that may be due to an interaction between genetic predisposition and environmental factors.

Population Differences

While all population groups express thousands of genetic diseases, several single-gene Mendelian disorders are limited to or found in much higher frequency in specific population groups. For example, the gene causing Tay-Sachs disease is rare in all populations except in Ashkenazi Jews from Eastern Europe and in French Canadians where the frequency of carriers may be as high as 1 in 30.[1,2] Since Tay-Sachs disease is concentrated within particular populations, counseling, carrier screening, and prenatal diagnosis can be targeted to these limited groups.

Sickle cell anemia occurs most frequently in areas with a high endemic incidence of malaria,[1] and this deleterious gene is thought to provide selective advantage to heterozygous carriers through increased resistance to malaria. Among black Americans the frequency of the trait is between 8 and 10 percent, corresponding to a gene frequency of about .05.[1] However, the gene frequency in this country will most likely decrease, since there is no heterozygote advantage to carriers in this environment and homozygous affected individuals have a severe selective disadvantage.

Genetic Traits and Environmental Triggers

Other types of single-gene disorders are interesting because an interaction with an environmental agent is necessary for disease expression. When the antimalarial drug primaquine was administered to American servicemen during World War II, severe hemolytic anemia was noted in a large number of individuals, most commonly black males.[3] This anemia was caused by glucose-6-phosphate dehydrogenase (G6PD) deficiency in the affected individuals. G6PD deficiency originated in the Mediterranean area where malaria is endemic, and it is now known that G6PD deficient cells are more resistant to malarial parasite infection.[4]

The field of pharmacogenetics has developed as a result of discovering the genetic variation in response to therapeutic drug use. For some therapeutic agents, the rate of metabolism and therefore dose-response is dependent on genotype. Individuals are asymptomatic in the absence of the specific medication or environmental agent but on exposure become affected by characteristic symptoms due to the effect of a single mutant gene. This suggests many other disorders of genetic origin also may require an external environmental trigger for expression.

Multifactorial Traits

When pedigrees of individuals affected with single-gene disorders are examined, Mendelian patterns of inheritance (dominant, recessive, X-linked) usually are apparent. However, many disorders such as birth defects cluster in families but do not follow strict Mendelian inheritance patterns. These types of diseases are often attributed to multifactorial inheritance; that is, an interaction between an underlying genetic susceptibility and environmental factor(s) leading to disease. The underlying genetic susceptibility usually is attributed to the additive effects of many genes (polygenes), and recurrence risks are usually in the range of 3 to 5 percent. It is important to note that in recent years many traits previously thought to be caused by the small, additive effects of many genes have been shown to involve a single gene with major effect. Examples of such disorders include cleft palate, heart disease resulting from hypercholesterolemia, and some forms of cancer.[5-7] The determination of inheritance patterns and recurrence risks for specific disorders may require analysis of substantial numbers of pedigrees.

Genetic Analysis

In the assessment of any complex group of diseases or malformations, it is first necessary to consider heterogeneity and pleiotropy. A single disorder may have many different causes (heterogeneity), leading to variability in phenotype. On the other hand, a single mutant gene with many different effects (pleiotropy) also contributes to variability among cases. Thus, prior to specific hypothesis testing for different modes of inheritance, cases recognized as the result of different etiologic mechanisms must be separated.

In any attempt to identify a genetic etiology for a disorder, it is necessary to evaluate the nature and cause(s) of the familial aggregation. Familial aggregation of disease is defined as an excess number of affected relatives of cases as compared to relatives of controls. However, simply measuring familial aggregation in this way does not distinguish between possible genetic or environmental causes, and one needs to exercise caution when interpreting the results.

Epidemiologists are interested in familial relationships as a risk factor for disease, whereas geneticists are interested in the underlying biology that causes aggregation in families. After confirming the presence of familial aggregation of a trait, geneticists use segregation analysis to determine if the disease is transmitted from parents to offspring in accordance with

Mendelian laws of inheritance. During the past decade sophisticated computer programs have been developed to test for Mendelian single-gene patterns of inheritance, major gene models of inheritance, and "mixed" models of inheritance with both additive genetic and environmental effects. These methods estimate the probability that individuals with various genotypes will be affected with the disease (penetrance), the probability that the disease genotype will be transmitted from parents to offspring, and the frequency of the mutant allele in the population under study.

Thus, current studies of common disorders merge the disciplines of genetics and epidemiology in an attempt to identify both genetic and environmental risk factors for familial disease. The Baltimore-Washington Infant Study, a comprehensive study of a complex group of malformations that are attributed to multifactorial inheritance, exemplifies these principles.

Baltimore-Washington Infant Study

Congenital cardiovascular malformations (CCVM) are a heterogeneous group of defects. Although some are known to be associated with teratogenic exposures, chromosomal anomalies, and single-gene disorders, the vast majority are of unknown etiology and are attributed to multifactorial inheritance.[8] The Baltimore-Washington Infant Study (BWIS), an ongoing population-based case-control study under the direction of Dr. Charlotte Ferencz, was initiated in 1981.[9,10] Its goal is to identify environmental and genetic risk factors for CCVM in the defined geographical area including Maryland, Washington, DC, and five counties in Northern Virginia. All infants diagnosed with a CCVM (confirmed by echocardiography, cardiac catheterization, surgery, or autopsy before one year of age) are compared to a random sample of the resident birth cohort. Detailed sociodemographic and medical information, environmental exposures, and family history information on all first- and second-degree relatives are collected from patient and control parents during at-home interviews.

There are several advantages to using this type of population-based design for the study of genetic diseases. Complete ascertainment of all cases is achieved through the cooperation of the six regional pediatric cardiology centers and through annual review of death certificates to identify cases who died before diagnosis. Thus, it is possible to calculate accurately the frequency of all defects in this population and to include all families in estimations of recurrence risks for these malformations. A population-based study avoids some of the biases in clinical studies that do not include the more severely affected cases who die soon after birth. The cooperation of pediatric cardiologists at the referral centers also insures consistency of diagnosis, leading to more accurate definitions of the affected phenotype.

In analyzing data from the BWIS, we first separated cases attributed to chromosomal anomalies, single gene syndromes, and teratogenic exposures and focused on cases with isolated cardiac defects (Table 1). Next, the issue of classification of types of defects was considered. Analyzing all CCVM as a single group could overlook the characteristics and risk factors associated with a specific subgroup. However, splitting CCVM into many subgroups might ignore interactions that occur in the developing embryo and result in groups that were too small to analyze. Therefore, new concepts were used to classify CCVM according to pathogenic mechanisms that may be important in the developing heart.[11]

Table 1. Ascertainment of Cases with Congenital Cardiovascular Malformations (1981 - 1986) in the BWIS

Type of defect	Number
Isolated cases	1,626
Cases with extra-cardiac defects	
Chromosomal anomaly	282
Syndrome/heritable disorder	86
Suspect syndromes *	29
Infective, toxic, or endocrine embryopathy	17
Non-syndromal malformation	199
	613
Total	2,239

* These represent complexes of multiple malformations which do not conform to previously described associations of anomalies.

Analysis of familial aggregation indicated there was an excess of affected first-degree relatives among families of patients with specific isolated CCVM attributed to abnormal embryonic blood flow; this includes patients with hypoplastic left heart syndrome, aortic stenosis, coarctation of the aorta, atrial septal defect (secundum), pulmonary stenosis, and patent ductus arteriosus (Table 2).[12] New biostatistical techniques also permitted us to examine the effect of sex, race, and maternal age on the risk of CCVM[13]; none was found to have a significant effect on risk to siblings.

BWIS family data from cases with CCVM attributed to altered embryonic blood flow were then used in segregation analysis in an attempt to identify a Mendelian mode of inheritance.[14] Preliminary results suggested an autosomal recessive model of inheritance among families of patients with left heart obstructive defects, right heart defects, and perimembranous ventricular septal defect (VSD)(Table 3). The risk of CCVM in families of probands with VSD and right heart defects appeared to be closely associated with race. There was increased risk to relatives of white patients with right heart defects and to relatives of black patients with VSD. Differences in the exposures and demographic characteristics of the white and nonwhite mothers of probands in this data set may explain part of this familial aggregation. However, as discussed previously, many examples of genetic defects are found more frequently in specific ethnic or racial groups.

Further studies are needed to determine the role and

Table 2. Affected First-Degree Relative of Cases with Isolated Congenital Cardiovascular Malformations

	Number of Probands	Affected Parents	Normal Siblings	Affected Siblings
Looping abnormalities	41	-	22	-

Table 3. Genetic Model Testing of Specific Groups of CVM

Type of Defect	Number of Families	Best Fitting Model
Left heart defects	142	Autosomal recessive
Right heart defects	113	Autosomal recessive with race effect
VSD	120	Autosomal recessive with race effect

possible interaction of genes and environment in the familial aggregation of CCVM among different racial groups revealed in this analysis. A pilot study of families of patients with hypoplastic left heart syndrome showed that several parents had silent defects that were identified by echocardiography.[15] Further studies of specific types of families are needed before we can conclude that specific CCVM are due to the effect of a single mutant gene. In addition, investigations will continue to determine the degree of variability of specific malformations within and among families, and further clarification will be sought regarding heterogeneity in this complex group of developmental malformations.

Conclusions

The analysis of familial traits (qualitative and quantitative) has advanced significantly in the last several decades. The original approaches of identifying clear-cut Mendelian patterns by simple recognition and correlation of biometrical measures between relatives have been supplanted by more formal genetic hypothesis testing and the search for specific genetic and environmental etiologic factors. The focus of these analyses has turned from the individually rare familial disorders, such as metabolic diseases, to the more common causes of major health problems that often cluster in families.

There is a growing evidence that many complex diseases are heterogeneous in nature. Alzheimer's disease, autism, cardiovascular disease, congenital malformations, and cancer are among the many complex diseases suspected of having a strong genetic component. Epidemiological investigations continue to identify individual and environmental risk factors for these diseases, while genetic analyses attempt to elucidate an underlying biological mechanism. The findings of these types of studies will be important to clinicians in predicting risk, counseling family members, developing presymptomatic testing programs, and designing therapeutic strategies.

Acknowledgments

The Baltimore-Washington Infant Study investigators are Drs. Charlotte Ferencz, Judith D. Rubin, Robert J. McCarter, Adolfo Correa, P. David Wilson, Joel I. Brenner, Catherine A. Neill, Lowell W. Perry, Seymour I. Hepner, Mohamed Mardini, and John W. Downing. We are grateful to all the physicians and hospitals in the region for their cooperation in case finding and control ascertainment.

Recent Advances in Genetics

Miriam G. Blitzer PhD, Stuart Schwartz PhD, Tina M. Cowan PhD, and Leslie J. Raffel MD

From the Division of Human Genetics, Departments of Pediatrics and Obstetrics and Gynecology, University of Maryland School of Medicine, where Drs. Blitzer, Schwartz, and Raffel are Assistant Professors; and Dr. Cowan is a Research Associate.

Recent advances in the specialties of molecular genetics, biochemical genetics, and cytogenetics have made it apparent that comprehending their interdependence is necessary for complete understanding of genetic disease.

The field of of human genetics has advanced dramatically over the last 20 years. From identifying the underlying cause of numerous metabolic diseases to defining many inherited syndromes both clinically and cytogenetically, major inroads have been made in our understanding of genetic disease. The newest discipline that has influenced research in human genetics is molecular biology. The application of molecular technology to all disciplines has led to better understanding of the basic defects at the DNA level that lead to disease.

Molecular Genetics

As a result of advances in DNA technology during the last 15 years, we are now beginning to understand and to be able to diagnose human disease directly at the gene (DNA) level. An important first step toward this goal was the discovery of restriction endonucleases, a group of enzymes naturally used by bacteria to destroy the foreign DNA of infecting viruses.[1] These restriction endonucleases are now exploited by molecular biologists to cleave and manipulate DNA from eukaryotic cells. With the use of these enzymes it is possible to isolate a specific human gene and to insert, or clone, it into a rapidly replicating bacterial system. Large numbers of copies of the gene of interest can be generated and used in further molecular analyses.

In addition, restriction enzymes are also important in other aspects of the characterization of human DNA. Each of these enzymes recognizes a specific nucleotide sequence (between 4 to 8 bases) in the DNA and always cleaves the DNA at the same site relative to the recognition sequence. Thus, when DNA from a given patient is isolated and digested with a single restriction endonuclease, the same group of DNA fragments is always generated. The number and size of these restriction fragments depends on the frequency of specific recognition sequences (or restriction sites) in that patient's DNA. The recognition sequen-

ces range from only a few base pairs in length, which are likely to occur frequently within the human genome, to longer sequences that occur less often. Therefore, restriction enzymes with short recognition sequences generally will produce small DNA fragments, while those with longer recognition sequences will generate larger fragments. It is important to note that restriction sites occur both within and between genes and are in no way related to either the expression of genes or the functioning of their products.

Once a gene has been cloned, it is possible to use that gene to determine the presence or absence of a mutation in the corresponding gene of a patient. A common approach toward this goal is "restriction fragment length polymorphism" (RFLP) analysis.[2] In this procedure, DNA is isolated from a blood sample and treated with a specific restriction enzyme to produce small fragments. The DNA is then applied to an agarose gel and subjected to electrophoresis, which separates the restriction fragments according to size. The separated fragments are then transferred onto a piece of nitrocellulose filter or nylon membrane by Southern blotting, a procedure in which the DNA is eluted from the gel to the membrane, where it irreversibly binds. This preserves the original pattern of separated fragments from the agarose onto the membrane. The cloned gene of interest is then radioactively labeled, and the membrane containing the patient's DNA is incubated in a solution containing the labeled gene, or probe. The probe recognizes and anneals to complementary sequences in the patient's DNA and, after exposure of the blot to x-ray film, an autoradiogram is generated in which the visible bands are those that contain sequences recognized by the labeled probe. The size of the restriction fragment or fragments from the patient's DNA that are recognized by the labeled gene depends on the distribution of restriction sites relative to that gene.

Sickle cell anemia was the first human disease in which RFLP analysis was used clinically. In 1978, Kan and Dozy reported that when DNA from different individuals was digested with the restriction enzyme HpaI, subjected to agarose electrophoresis and Southern blotting, and hybridized with a radiolabeled β-globin gene probe, two different-sized fragments could result.[3] This occurs because some individuals have a HpaI recognition sequence closely linked to the β-globin gene, while in other individuals this restriction site is absent. Although the presence or absence of this site does not itself cause sickle cell anemia, it can be used as a marker for the β-globin mutation in informative families, that is, families in which the parental genes with the β-globin mutation are carried on different sized HpaI fragments than the normal genes.

Thus, in an informative family with at least one affected child, subsequent pregnancies can be monitored for sickle cell anemia by first analyzing the DNA from the affected child and both parents and determining which HpaI fragments contain the mutant β-globin genes. The presence or absence of the mutant alleles in a fetus can then be inferred from its pattern of HpaI fragments. Although clearly a step forward in prenatal diagnosis for sickle cell anemia, this type of RFLP analysis has drawbacks in that it is only useful for families who have had at least one affected child. In addition, it cannot be used for families in which the mutant β-globin alleles are carried on the same-sized HpaI fragments as the normal alleles (that is, uninformative families). Finally, because this analysis identifies the presence or absence of a restriction site closely linked to, but not directly at, the site of the mutation itself, the possibility exists for a recombinational event (crossing over of DNA segments between two homologous chromosomes) altering the relationship between the mutation and the restriction site. For this reason, there is a small chance that this type of analysis will incorrectly predict an unaffected fetus that has actually inherited the sickle cell mutation from both parents.

Subsequently, it was found that the recognition site for a different restriction enzyme, MstII, occurs directly at the site of the sickle cell mutation itself. In the normal β-globin gene this MstII site is present and the DNA is cleaved into two smaller fragments on treatment with the enzyme. The sickle cell mutation serves to alter this site such that cleavage by MstII does not occur. The presence or absence of this site can again be visualized by hybridizing with labeled gene probes from the β-globin region following electrophoresis and Southern blotting. In contrast to analysis with HpaI, this method involves direct ascertainment of the point mutation causing the disease, and recombination cannot occur. Therefore, prenatal diagnosis is now available for all couples at risk for having a child with sickle cell anemia, whether or not they have had an affected child.

A technological advance important in the prenatal diagnosis of hemoglobin (Hgb) SC is oligonucleotide probing.[4] MstII cannot distinguish between the normal Hgb A and mutant Hgb C alleles since the Hgb C mutation does not alter the normal MstII recognition sequence, and therefore RFLP analysis with this enzyme is not informative. Instead, oligonucleotide probes, or short pieces of DNA, are synthesized that directly correspond to the known DNA sequences of Hgb A, C, or S in the region of the mutation site. Under stringent laboratory conditions, these probes recognize and bind only to patient DNA that is exactly complementary; binding does not occur if the oligonucleotide probe and the patient DNA differ by even a single base pair. In the assessment of a fetus at risk for Hgb SC disease, the fetus is affected if both the Hgb S and Hgb C probes hybridize to fetal DNA. If, however, one of these probes does not anneal to the sample, the fetus is not affected. In this case, the Hgb A probe is expected to bind to the fetal DNA sample as well.

In addition to sickle cell anemia, molecular techniques are now used in the diagnosis of several dozen genetic disorders, including cystic fibrosis, Duchenne

muscular dystrophy (DMD), hemophilia A, α- and β-thalassemia, adult polycystic kidney disease, and Huntington disease. Unfortunately, the actual genes causing most of these disorders have not yet been cloned, so analysis is limited to inference of the disease-causing gene by linkage to a nearby RFLP. For some disorders, RFLPs occur in segments of DNA very close to the disease-causing gene, and in these cases RFLP analysis is quite reliable. However, for other disorders the RFLPs that have been identified are relatively far away from the disease-causing gene, such that recombination between the two sites occurs fairly commonly. For this reason it is always necessary, when offering prenatal diagnosis to families, to take into consideration the risk of misdiagnosis as a result of recombination. For a family facing a 25 percent risk of having an affected child (that is, a family at risk for an autosomal recessive disorder such as cystic fibrosis), the ability to use RFLP analysis to reduce their risk to only 3 to 5 percent may be extremely reassuring, even though the risk has not been totally removed.

The most recent molecular technique to be used in prenatal diagnosis involves the use of the polymerase chain reaction (PCR).[5,6] Using PCR, a specific DNA sequence can be amplified to many thousands of copies very quickly when starting from only a very small sample of DNA. For this reason, the development of PCR has drastically reduced the time necessary for prenatal diagnosis, since it is no longer necessary to culture the cells obtained by amniocentesis or chorionic villus sampling to generate the large amounts of DNA required for analysis. Instead, amniocytes or chorionic villus tissue is taken directly after sampling, and the portion of DNA to be studied is amplified using PCR. Sufficient DNA is generated to enable prenatal diagnosis to be completed within hours of the time the sample was obtained.

The application of recombinant DNA technology has led to the molecular identification and characterization of some disease-causing genes themselves. This is the case for Duchenne muscular dystrophy (DMD), for which prenatal diagnosis was performed using RFLP analysis with anonymous X-chromosome probes thought to recognize sequences closely linked to, but not within, the DMD gene. It was later discovered that one of these anonymous probes contained a portion of the DMD gene itself, and by using this probe it was ultimately possible to isolate and clone the entire DMD gene. This gene has been shown to encode a protein (dystrophin) located close to the cell membrane of skeletal muscle that appears to be important in protecting the muscle cell from damage during contraction. Thus we can study the pathophysiology of DMD in much greater detail.

Analysis of the DNA from patients with DMD has revealed a series of different, large deletions of the dystrophin gene in as many as 70 percent of cases. Therefore, for families in which a deletion is identified as the cause of DMD, carrier detection for females, as well as prenatal diagnosis, can be provided since restriction enzyme sites are also deleted, leading to abnormal banding patterns on Southern analysis. For those families in which a deletion cannot be demonstrated, carrier detection and prenatal diagnosis still can be performed by classic analysis of linked RFLPs, although this approach is inherently less accurate than in those cases where a deletion is found.

In contrast to the successful isolation and characterization of the DMD gene, attempts to clone other disease-causing genes where linked RFLPs have been identified, most notably Huntington disease, have not been as productive. The approach for cloning these genes involves the techniques of chromosome "walking" and "jumping," in which the probe recognizing an RFLP linked to the disease-causing gene is used to identify and clone a neighboring, overlapping sequence that is similarly used to identify the next overlapping sequence, and so on. In this way, one moves closer and closer to the gene of interest.

It is now clear that the distance between some disease-causing genes and their linked RFLPs may be quite large, and chromosome walking and jumping therefore can be technically very difficult and time consuming. To overcome these difficulties, a new technique (pulsed field gel electrophoresis) has been developed that allows the separation of much larger fragments of DNA than can be separated by conventional electrophoretic techniques.[7] These larger DNA fragments are generated by a group of restriction enzymes called infrequent cutters, for which restriction sites occur only rarely in the human genome. Isolation and screening of these larger fragments to see if they contain the gene of interest should allow for more rapid cloning of disease-causing genes, including Huntington disease.

Biochemical Genetics

The field of biochemical genetics is changing rapidly, most importantly as a result of advances in molecular biology and the application of the new techniques to the study of inborn errors of metabolism. Contemporary investigations are leading to a heightened appreciation of the vast molecular heterogeneity that underlies many disorders as well as providing new insights into the relationship between the structure and function of specific genes and their products. Since we cannot address all the important advances in biochemical genetics, we review some new areas of research, highlighting a few specific disorders to illustrate the growth in this field.

Inherited disorders of organic acid metabolism
In 1966, Tanaka and his colleagues first used gas-liquid chromatography (GC) and mass spectrometry (MS) to identify abnormal compounds in urine from a young patient, which led to the diagnosis of isovaleric acidemia, an inborn error of organic acid metabolism.[8] Since that time, more than 60 additional diseases have been described in which organic acids accumulate in abnormal amounts in physiological fluids. Organic

acids include metabolic intermediates from amino acids, lipids, carbohydrates, and steroids. An enzymatic block at any metabolic step in these pathways leads to an abnormal accumulation of organic acids in blood; these acids are concentrated by the kidney and excreted in the urine, where they can be detected and quantified using GC/MS. By examining the specific compounds excreted, the location of the specific metabolic block can be inferred.[9]

Despite the large number of different organic acidurias, the clinical findings for this group of disorders as a whole are somewhat nonspecific. Patients typically present within the first weeks or months of life with failure to thrive, vomiting, and abnormal neurological findings, including seizures, hypotonia, lethargy, or coma. Laboratory findings often include metabolic acidosis, hypoglycemia, ketosis, hyperammonemia, and hyperglycinemia. Significant heterogeneity exists for these disorders, and more mildly affected patients may present with only developmental delay or mental retardation. Although the organic acidurias are individually very rare, as a group they are relatively common (estimates are as high as 1/3,000 births) and therefore must be considered in the differential diagnosis of any acutely ill infant or child, particularly one with a history of recurrent episodes of metabolic collapse of unknown etiology.

Studies of the precise biochemical defects that underlie specific organic acidurias have revealed an unexpected degree of heterogeneity. The majority of organic acidurias are caused by a mutation in a specific enzyme. To have functional activity, some of these proteins require vitamins as cofactors, and several disorders exist with defects in cofactor formation or binding to the apoenzyme. These patients usually respond to megavitamin treatment. One of the newer vitamin-responsive disorders described is biotinidase deficiency, in which a single enzyme defect leads to secondary blocks in multiple enzymatic steps.[10] This autosomal recessive disorder results from deficient activity of biotinidase, an enzyme essential for the recycling and utilization of biotin. Biotin is a vitamin required by at least four different carboxylase enzymes involved in amino acid and carbohydrate metabolism. Biotinidase deficiency therefore leads to a secondary deficiency in biotin, leading in turn to blocks in each of the biotin-dependent enzymatic steps. This disorder also is called late-onset multiple carboxylase deficiency. Patients typically present within the first year of life with seizures, ataxia, developmental delay, hearing loss, alopecia, and skin rash. If left untreated, life-threatening illness with ketoacidosis and organic aciduria can develop. However, treatment with biotin is highly successful in reversing most of the clinical and biochemical abnormalities. Finally, with the implementation of newborn-screening programs for biotinidase deficiency in several states, individuals have been identified with reduced, but not absent, biotinidase activity. The molecular characterization of these variants is expected to provide insight into the structure and function of the biotinidase enzyme.

The organic acidurias also include defects in fatty acid oxidation, or the sequential breakdown of fatty acids to ketone bodies, that enter the tricarboxylic acid cycle and ultimately are used in the production of energy. One disorder receiving a great deal of attention is medium-chain acyl CoA dehydrogenase (MCAD) deficiency.[11] Deficiency of MCAD leads to a block in utilization of fats for energy; this in turn increases demand on utilization of glucose and therefore to precipitous episodes of hypoglycemia. The resulting hypoglycemic shock can lead to sudden death, and it has been suggested that this disorder may account for some cases of sudden infant death syndrome. As our awareness of MCAD deficiency increases and more patients are being diagnosed, it appears likely this may be one of the more common inborn errors of metabolism.

Mitochondrial myopathies Mitochondrial myopathies have been described both clinically and pathologically for decades, yet the underlying biochemical and molecular details only recently have begun to be elucidated. These disorders result from enzymatic blocks in the energy-producing reactions of the oxidative phosphorylation (ox-phos) pathway, which occurs in the mitochondria. Mitochondria are unique organelles in that they contain their own genetic material, some of which encode enzymes of the ox-phos pathway. The majority of enzymes involved in electron transport are encoded in the nucleus and must be transported into the mitochondria. Mitochondrial disorders can therefore arise as a result of mutations in either nuclear or mitochondrial genes. Those resulting from nuclear mutations are inherited in a classical Mendelian fashion. In contrast, those resulting from mutations in mitochondrial DNA are inherited exclusively from the mother (maternal inheritance), since mitochondria are passed on in ova not sperm. This is important not only from the standpoint of unraveling the complexity of the mitochondrial myopathies but also in terms of counseling families at risk for having a child with one of these disorders.

Two mitochondrial disorders very recently have been characterized at the molecular level, Leber's hereditary optic neuropathy (LHON)[12] and myoclonic epilepsy associated with ragged-red muscle fibers (MERRF).[13] Both these disorders result from mutations in mitochondrial DNA. To determine the precise molecular defect in LHON, the entire mitochondrial genome from LHON patients was sequenced and compared with that of normal individuals. This analysis revealed that LHON results from a single base pair substitution in the gene for NADH dehydrogenase subunit 4. Furthermore, this mutation eliminates the recognition site for the restriction enzyme Sfa NI, thereby providing a simple means for distinguishing affected from unaffected individuals. Although the precise mutation resulting in MERRF

has not yet been identified, it is thought to be a point mutation or other small rearrangement in a single ox-phos gene. For both LHON and MERRF patients, a spectrum of clinical symptoms is seen, possibly as a result of the influence of other genetic and environmental factors in conjunction with an ox-phos defect. In addition, the variable phenotypic expression of MERRF appears to be a function of the distribution of normal and mutant mitochondria within cells (referred to as heteroplasmy). Therefore, even if a specific mutation is detected in a female, it is impossible to predict the degree of severity with which her children will be affected, since the proportion of mutant to normal mitochondria may vary in each offspring.

Peroxisomal disorders Peroxisomes are organelles containing catalase, an enzyme that oxidizes hydrogen peroxide (as well as other enzymes involved in a variety of metabolic processes) including the oxidation of very long chain fatty acids (chain length greater than 22 carbons) and dicarboxylic acids, the biogenesis of bile acids and plasmalogen, and the catabolism of leucine and phytanic acid. Although peroxisomes were originally described in the early 1960s, their biogenesis, function, and role in human disease are only now being elucidated. Human peroxisomal disorders are characterized by either the absence of peroxisomes (for example, Zellweger's syndrome or infantile Refsum's disease) or the abnormal function of one or more peroxisomal enzymes (rhizomelic chondrodysplasia punctata or X-linked adrenoleukodystrophy).[14] The clinical findings for these disorders are highly variable and can include severe mental retardation, seizures, multiple congenital anomalies, hepatomegaly, hypotonia, peripheral neuropathy, cerebellar ataxia, and retinitis pigmentosa. Depending on the specific disorder, age of onset can vary from early infancy to adulthood. Biochemically, very long chain fatty acids are elevated; evaluation of other biochemical functions that occur in this organelle also are useful when considering these disorders.

Molecular approaches to biochemical genetic disorders With the application of molecular techniques, we are beginning to understand the basis for the clinical and biochemical heterogeneity of various inborn errors of metabolism in terms of specific molecular defects. This is illustrated by recent studies on Tay Sachs disease, a lysosomal storage disorder caused by deficient activity of β-hexosaminidase A (hex A), due to a mutation in the α-chain of this polypeptide. The disorder occurs most frequently in the Ashkenazi Jewish population and in a non-Jewish French Canadian inbred group. The disease in these two populations is the same with respect to age of onset, clinical presentation, and virtual absence of enzyme activity. Surprisingly, however, it recently was demonstrated that the hex A mutations in these two populations are entirely different: the French Canadian mutation is a large deletion in one end of the hex A gene, while that for Jewish patients was shown to be a single nucleotide substitution. In addition, further studies of the hex A gene in Jewish patients have revealed a second mutation responsible for Tay Sachs disease in this population. This unexpected degree of molecular heterogeneity between and within populations will help clarify both the possible biochemical and clinical effects of various hex A mutations, as well as the mechanisms responsible for the maintenance of the various mutations in these populations.[15]

Cytogenetics

Although the discipline of cytogenetics has existed since the early 1900s, clinical cytogenetics (the study of the relationship between chromosomal aberrations and human disease) has been investigated extensively only since 1956 when Tjio and Levin first reported that the true chromosome number in humans is 46. This report quickly led to the cytogenetic characterization of a large number of clinical syndromes in which there is an underlying chromosomal abnormality. In its broadest sense, cytogenetics overlaps many medical disciplines, most importantly pediatrics, obstetrics, hematology, and oncology. Cytogenetic analysis is used in many different situations, including

1. Diagnosis of autosomal or sex chromosome abnormalities in pediatric patients
2. Prenatal diagnosis in conjunction with amniocentesis, chorionic villus sampling or percutaneous umbilical blood sampling
3. Fertility workup to determine if the cause of a couple's infertility or multiple pregnancy loss is chromosomal in nature
4. Determining whether fetuses that are lost as spontaneous abortuses or stillbirths may have a chromosomal abnormality

Cytogenetic techniques are applied within the disciplines of hematology and oncology in the evaluation of chromosomal changes in leukemias and solid tumors. The following overview of these commonly known facets of cytogenetics discusses some of the more recent advances in medical cytogenetics specifically pertaining to the pediatric and obstetric disciplines.

Autosomal and sex chromosome abnormalities Since the discovery that Down syndrome is caused by an underlying chromosomal abnormality (trisomy 21), many other autosomal and sex chromosomal syndromes have been defined. The major chromosomal syndromes are listed in Table 1, including Down syndrome, trisomy 13, trisomy 18, Turner syndrome, and Klinefelter syndrome.[16] Although many more syndromes associated with abnormal chromosomal findings have been described, current advances in cytogenetics are taking place not in the characterization of syndromes *per se* but in the development of new laboratory techniques for diagnosing these syndromes. To date, the majority of cytogenetic studies have been carried out using standard techniques for cell culture and chromosome banding. However, high-resolution chromosome studies

Table 1. Commonly Encountered Cytogenetic Syndromes

Syndrome	Karyotype	Frequency
Down	47,XX,+21+ 47,XY,+21	1/700 livebirths
Trisomy 18	47,XX,18+ 47,XY,+18	1/8,000 livebirths
Trisomy 13	47,XX,+13+ 47,XY,+13	1/10,000 livebirths
Turner	45,X* 46,X,iso(Xq)	1/5,000 livebirths
Klinefelter	47,XXY	1/1,000 livebirths

+ Most commonly seen due to nondisjunction, however may be encountered as a Robertsonian translocation [e.g., 46,XY,-14,+t(14q21q)]

* 45,X karyotype found in 60% of cases of Turner syndrome

Table 2. Syndromes Associated with Subtle Chromosomal Abnormalities

Syndrome	Chromosomal Abnormality
Langer-Giedion	Deletion 8q24.1
Aniridia-Wilm's Tumor Association	Deletion 11p13
Retinoblastoma	Deletion 13q14
Prader-Willi	Deletion 15q11-q13
Angelman	Deletion 15q11-q13
Miller-Dieker	Deletion 17p13.3
DiGeorge	Deletion 20q11.2
Cornelia de Lange	Duplication 3q25-qter
Beckwith-Wiedemann	Duplication11p13-p15

and banding techniques have been developed that allow for the study of chromosomes in much finer detail than was previously possible. These methods have been used to characterize several subtle cytogenetic syndromes involving a small deletion or duplication of chromosomal material, some of which are listed in Table 2.

It is noteworthy that the cytogenetic basis for these syndromes may not be recognized using standard techniques.[17] Additionally, many fit the new classification known as contiguous gene syndromes. These syndromes, first described by Schmickle in 1986, demonstrate recognizable patterns of malformations often in association with mental retardation and growth abnormalities.[18] Included are a number of phenotypic abnormalities that cannot be explained by a single gene defect but rather are thought to involve, to varying degrees, small deletions or duplications of chromosome material or rearrangement of two or more neighboring genes. Although not all the syndromes listed in Table 2 are known to be contiguous gene syndromes, they all involve, to varying degrees, small deletions or duplications of chromosome material. However, chromosomal rearrangements are not seen in every patient with a given syndrome; it is thought that patients without visible cytogenetic deletions may in fact have deletions too small to detect microscopically that can only be demonstrated utilizing DNA technology. This is true for several cases of both Miller-Dieker syndrome and Prader-Willi syndrome. These syndromes not only illustrate the utility of higher-resolution technology but also denote syndromes that are most amenable to diagnosis utilizing molecular cytogenetics (a combination of DNA and cytogenetic techniques).

The most recent advance in the study of the sex chromosomal abnormalities is the further characterization of the fragile-X syndrome, which was first described in the late 1960s.[19] This disorder, also called Martin-Bell syndrome, has come under considerable scrutiny in the last decade, and is considered to be the most common cause of inherited mental retardation in males. It is characterized cytogenetically by a small "constriction gap" or break in the long arm of the X chromosome under specific cell culture conditions. Fragile-X syndrome is a well-established syndrome with phenotypic features that may include a long face, mid-face hypoplasia, prominent forehead, large mandible, large, simple pinnae, and, frequently, large testes. A comparison of the phenotypic differences between black and white males with fragile-X syndrome revealed that the craniofacial traits including the long face, mid-facial hypoplasia, large jaw, and simple pinnae were found less frequently in black males and in the prepubertal boys of both races. In general, males with fragile-X syndrome are found to have normal head circumference, length, and weight at birth; head circumference then typically increases to above the 50th percentile, and continues to be above average throughout the preadult years. There are no significant increases in height and weight during this period. Psychomotor development is significantly delayed in these males. In one study, the average age for attaining unassisted walking was 20.6 months, the time until the first clearly spoken words was 20 months, coupling words into phrases was 45 months and use of sentences 60 months. The average IQ of affected males has been estimated at 33.3.

The literature regarding the association of the fragile-X chromosome with autism and mental retardation recently has been reviewed by Fisch *et al.*[20] In the 15 independent studies of autistic males, ranging in sample size from 6 to 183, the frequency of fragile-X syndrome ranged from 0 to 15.7 percent, with an overall frequency of 6.7 percent. In addition, 16 much larger studies of mentally retarded males, ranging in sample size from 66 to 818, were reviewed. The frequency of fragile-X syndrome in these studies ranged from 0 to 19.5 percent, with an overall frequency of 5.3 percent.

One important feature of fragile-X syndrome is that of all males who inherit the fragile-X chromosome from a mentally *normal* female, only 78 percent actually express the phenotypic characteristics of fragile-X

syndrome.[21] In contrast, 100 percent of the males that inherit the chromosome from a mentally *impaired* female express the syndrome. Female carriers of the fragile-X syndrome exhibit variability for both the clinical phenotype and the *in vitro* expression of the fragile-X site itself. Female carriers of the fragile-X syndrome who express the fragile-X site have an average IQ of 53.6, while female carriers who do not express the fragile-X site have been shown to have normal IQ scores. Finally, approximately 56 percent of the females who inherit the fragile-X chromosome from a mentally impaired female and 32 percent of the females who inherit the chromosome from a mentally normal female express the fragile-X site and have some degree of mental impairment. These studies indicate the importance of fragile-X evaluation in both males and females with mental retardation or developmental delay of unknown etiology.

Prenatal diagnosis Advances in prenatal diagnosis are not related to specific findings but rather to new techniques. Cytogenetic analysis of amniotic fluid cells has improved mainly because of the advances in and more widespread use of new cell culturing techniques. Amniotic fluid cells are grown and harvested on either coverslips or in small chambers directly on microscope slides, allowing for more rapid diagnosis. Cultures can now be harvested and analyzed between 6 to10 days on the average, in comparison to 21 days when culture flasks were used as the major means of culturing cells. Since these cells grow in clones of cells, it also allows for more sophisticated evaluation of mosaicism and the origin of abnormalities within the amniotic fluid cells. Other advances in prenatal diagnosis tend to be associated more with obstetrical rather than with cytogenetic techniques.

The most recent advance in prenatal diagnosis is the implementation of chorionic villus sampling.[22] After a slow start, this technique has been readily accepted by the medical community. However, there is some degree of both false-positive and false-negative chromosomal findings in the analysis on the chorionic villus samples. Much of this complication has been eliminated by analyzing both direct preparations as well as short-term cultures of the chorionic villus specimen. While this may weaken the benefits of very rapid diagnosis, it also eliminates some of the difficulties and problems from the chromosome findings. Evaluating both direct preparation and short-term cultures from chorionic villus biopsies will result in a cytogenetic diagnosis within 7 to 10 days, leading to repeat studies (specifically amniocentesis), in only 1/100 biopsies analyzed.

Conclusions

It is apparent that research in all disciplines of human genetics is leading to better understanding of human disease. Advances being made at the DNA level by the use of new molecular technology could not have been made without the foundation of knowledge gained from basic biochemical and cytogenetic research. Further research, therefore, is dependent on close collaboration among all these specialties. As these techniques become more standard and are made available for diagnosis (especially prenatal or presymptomatic diagnosis), we must be aware of potential ethical dilemmas that may arise. The importance and application of these techniques to the future development of gene therapy may profoundly alter the futures of individuals with genetic disease. Only through careful and caring application of scientific development can we assure continuous rapid advancement and appropriate application to clinical care.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service.* Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

State-Sponsored Genetic Services in Maryland

Susan R. Panny MD and Barbara A. Bernhardt MS

Dr. Panny is Chief, Division of Hereditary Disorders, Maryland Department of Health and Mental Hygiene. Ms. Bernhardt is Genetic Counselor, Sinai Hospital of Baltimore. **Reprints:** *Division of Hereditary Disorders, DHMH, 201 W. Preston St., Baltimore, MD 21201.*

A cooperative network including Department of Health and Mental Hygiene (DHMH) units, university teaching hospital genetics units, and voluntary groups delivers state-sponsored medical genetic services in Maryland. Maryland's system is one of the most extensive and accessible in the United States.

Maryland is fortunate in being able to offer a relatively extensive and accessible network of genetic services to its residents. The Maryland Department of Health and Mental Hygiene (DHMH) coordinates this cooperative network that includes direct health department services, services provided by university teaching hospital affiliated genetics units, and services provided by various community based voluntary groups.

The goal of the cooperative network is to identify patients and to reduce the mortality, morbidity, and losses to society caused by genetic diseases and birth defects. Services are provided to patients having or suspected of having genetic disorders and to persons at risk for having children with genetic disorders. By law, all services in Maryland are offered on a voluntary basis and informed consent is required of all participants in any genetic services program.[1] The Maryland genetics network subscribes to the policy of the national Council of Regional Genetics Networks (CORN) that each state should provide certain minimal genetic services including newborn screening, access to state-of-the-art diagnostic and treatment services for affected patients and their families, birth defects surveillance, and educational and specialty programs appropriate to the state's specific needs and population.[2]

The network also has worked to eliminate the financial and geographical barriers that might prevent Maryland residents from best using the available genetic services. All Maryland residents are eligible for services, and no patient is turned away because of inability to pay.

Organization and Funding

The state genetic services network is supported by a combination of state general funds, federal Maternal and Child Health (MCH) Block Grant funds, and categorical grant (mostly federal) funds.

The service network consists of a central core unit in the Department of Health and Mental Hygiene and a grant program that it administers.

This DHMH core unit, the Division of Hereditary Disorders, located in the O'Conor State Office Building in Baltimore, is supported by approximately $310,000 in state general funds. The central core unit provides newborn screening, follow-up services (including dietary therapy for patients identified through newborn screening), hemoglobinopathy screening, alpha-feto-protein (AFP) screening, a birth-defects reporting and information program, a clinical genetics and prenatal diagnostic referral service, educational programs for professional and lay audiences, and a consultation service for local health departments and community health professionals. The Division of Hereditary Disorders works closely with other units in the state health department, especially the Laboratories Administration, to provide these services.

Case-management services for children with sickle cell disease are supported by a federal SPRANS (Special Projects of Regional and National Significance) grant of $182,000.

The grant program administered by the DHMH is supported by federal Maternal and Child Health (MCH) block grant funds. The Secretary of Health and Mental Hygiene has allocated approximately $400,000 of Maryland's MCH block grant for clinical genetic services. These funds support a unique cooperative arrangement. Maryland has long been a center for medical genetics, and many of the pioneers in this field have worked or trained in Baltimore. Several of the medical genetics units in leading Maryland medical institutions have had a long-term interest in providing genetic services on a population-wide basis but were unable to support the full cost of such services within institutional budgetary constraints. Knowing that the interest and some of the needed resources existed, the Department of Health and Mental Hygiene was able to initiate a clinical genetic services program by offering grants which provided a partial subsidy of the services to be procured. The grantees, mostly university affiliated teaching hospital genetics units, provide an in-kind contribution worth two to three times the dollar value of the grants. This partnership benefits both the medical institutions and the state, providing the institutions with a partial subsidy of clinical services at a time when federal research funding, which historically had supported some of these clinical activities, became increasingly difficult to obtain. The partnership provides Maryland residents with a significantly higher level of service than could be provided by either the state alone or the university teaching hospital genetics units alone.

Grants for the last three years have been awarded on the basis of proposals submitted in reply to a formal RFP (Request for Proposals) as specified in the *Maryland Code of Regulations*, Title 21. However, recent changes in the procurement policy for human services may simplify the procedure in the future. Specialized procurement regulations (*Maryland Code of Regulations* 10.52.01) specify the educational credentials, experience, and medical specialty board certification required of providers. For laboratories, continuing successful participation in appropriate laboratory proficiency testing programs also is required. This ensures that the genetic services procured by the DHMH are of the highest quality.

The clinical services procured through the grant program are provided on a tertiary center/outreach clinic model. Specialized laboratory services and community based sickle cell services are also provided through the grant program. Table 1 outlines the organization and funding of the service network.

Clinical Services

Clinical services are provided by the university affiliated teaching hospital medical genetics units at major medical centers. Each center provides comprehensive state-of-the-art clinical genetic services in-

Table 1. Organization and Funding of Genetic Services in Maryland

Functional Unit	Allocation*/Source	Services Provided
DHMH Core Unit	$310,000/state general funds	• newborn screening • metabolic disorder case management • birth defects program • AFP testing • hemoglobinopathy screening • educational programs • referral service • consultation for local health departments • liasion and administration
Hemoglobinopathy case management	$182,000/SPRANS grant	• computerized registry • hemoglobinopathy screening follow-up • genetic counseling at outreach clinics • case management • educational programs
Grant program	$400,000/MCH block grant funds $25,000/state general funds	• genetics center services at 4 centers • outreach clinics at 14 sites • laboratory monitoring for metabolic disorder • community-based sickle cell services (education, screening, counseling) • medical follow-up of patients with abnormal AFP tests (general funds)

* per year

cluding diagnostic evaluations, treatment, long-term medical management, and genetic counseling. Each center has a prenatal diagnostic program. Cytogenetic and biochemical genetic laboratory services also are provided. The DNA diagnostic laboratory is located at the Johns Hopkins Medical Institutions, and the organic acid screening laboratory is at the John F. Kennedy Institute. Services at the centers are provided by American Board of Medical Genetics certified MD clinical geneticists, PhD medical geneticists, and genetic counselors. Each center provides weekly genetics clinics and inpatient consultation at its own medical center and for affiliated community hospitals. There are currently four clinical genetics centers in the network: Johns Hopkins Hospital, University of Maryland Hospital, Greater Baltimore Medical Center (in the Baltimore area), and Children's Hospital National Medical Center (in the Washington, DC metropolitan area). All the centers see patients of all ages, but the Moore Clinic at Johns Hopkins is oriented primarily toward adults and the other units are oriented primarily toward children. Prenatal diagnostic patients are usually seen in separate facilities or scheduled separately. Although Children's Hospital National Medical Center is located outside Maryland, it is still the most convenient referral center for many families living in the counties surrounding Washington, DC and in southern Maryland. Approximately one third of the patients seen there are Maryland residents.

There are currently 14 genetics outreach clinics. Each one is unique, designed to meet local needs and preferences. Each meets approximately every other month, and each is staffed by personnel from one of the genetics centers. Diagnostic consultations, routine management for patients with genetic disorders, and genetic counseling, including prenatal diagnostic counseling, are offered. Should a patient require a subsequent trip into the genetics center for services that cannot be provided locally, the outreach team will coordinate that visit for the patient and his or her referring physician.

Referrals are welcomed from physicians, other health professionals, education and social work professionals, and genetic disease related voluntary groups. Self-referrals are also welcomed and receive the same serious consideration as other referrals. Approximately one third of all patients are self-referred. The clinic/center system serves approximately 8,000 people each year.

The system bills for its services, accepting private insurance, Medical Assistance, Children's Medical Services' subsidies, and other forms of third-party payment. Patients without third-party coverage are billed on the DHMH sliding fee scale. All providers will arrange liberal payment schedules. No patient is ever turned away for inability to pay. All fees are collected by the unit providing the service and must be used to underwrite, expand, and improve the genetic services program.

The Figure shows the location of the genetics centers and outreach clinics. Table 2 lists the clinics, their tertiary center affiliations, and contact persons.

Newborn Screening

In 1965 Maryland initiated a statewide newborn screening program, becoming the second state to do so. The DHMH newborn screening laboratory does the testing for babies born in Maryland, as well as in Delaware and Bermuda, and for overseas US military dependents. Over 100,000 babies (approximately 70,000 of them born in Maryland) are tested each year.

The Maryland program tests infants for phenylketonuria (PKU), maple syrup urine disease (MSUD, also called branched chain ketoaciduria or BCK), homocystinuria, tyrosinemia, galactosemia, biotinidase deficiency, hypothyroidism, and sickle cell disease. Screening is voluntary and requires informed consent. The DHMH provides informational brochures and detailed consent forms to assist health professionals in obtaining informed consent. Although the program is voluntary, Maryland is among the top two states in compliance with newborn screening and has better compliance than do most states with mandatory screening programs. The DHMH does not charge for newborn screening.

Ideally, each infant is screened twice. Infants are screened initially after they have had 24 hours of protein containing (milk) feedings. A second screening is offered between 1 and 4 weeks of age.

Responsibility for obtaining the initial specimen is with the institution in which the child was born or (for the less than 600/yr out-of-hospital births) with the person reponsible for filing the birth certificate. If a child is discharged before he/she has had 24 hours of milk feedings, the initial screening will have to be repeated as soon as feeding has been established. The tests for hypothyroidism, biotinidase deficiency, sickle cell anemia, and one of the two tests done for galactosemia will be valid regardless of feeding status. However, the remaining tests, which look for the accumulated metabolites of substances that the child cannot appropriately metabolize, will not be valid if the child has not been fed.

All abnormal screening test results are phoned im-

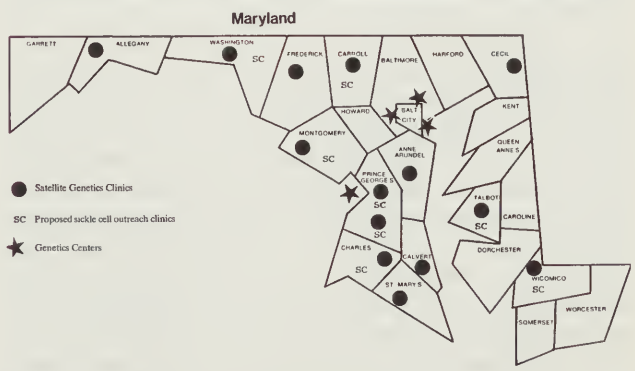

Figure.

mediately to the child's physician of record by the DHMH physician. Appropriate plans are made for a definitive diagnostic workup at any of the networks genetics centers. If the diagnosis is confirmed, plans for long-term management of the disorder are made. The major component of therapy for the inborn errors of metabolism is dietary. The program provides laboratory monitoring, the services of the metabolic specialists at the genetic centers and of the expert metabolic disease nutritionists at the DHMH, as well as genetic counseling. The special formulas for dietary therapy are available to eligible families through medical assistance; the Women, Infants and Children Food Program (WIC); and Children's Medical Services (CMS). The formulas are available to other families at DHMH cost through CMS. The DHMH writes to the companies of patients with medical insurance explaining the disease and the medical necessity for the formula, but many companies cannot be persuaded to cover special formula costs. Other services, such as psychometric and developmental monitoring are available on a referral basis. Families also are referred to the appropriate family support group. The DHMH nutritionists provide coordina-

tion and case-management services for these children, as desired by the child's pediatrician, and currently follow 157 metabolic disorder patients.

Infants identified as having congenital hypothyroidism may be referred to pediatric endocrine consultants at major university teaching hospitals.

Newborn screening is one of the most cost-effective public health genetics programs with at least $93,000 in additional health care costs averted per case detected and treated, according to the Office for Technology Assessment of the US congress.[3] In human terms, however, the program is invaluable, allowing 15 to 20 affected children each year to grow and develop normally to become productive citizens rather than mentally and neurologically impaired patients in institutional care.

Hemoglobinopathy Programs

Newborn infants are screened for sickle cell anemia as part of the newborn screening program. A federal grant from the Bureau of Maternal and Child Health and Resources Development (#MD 890502-0310) has made possible the implementation of a follow-up system for infants with abnormal newborn sickle cell screening results. The physician of record at the hospital of birth and the family are notified of abnormal results by the hemoglobinopathy program nurse coordinator. Arrangements are made for confirmatory testing and a definitive evaluation of confirmed cases by a pediatric hematologist. Prophylactic penicillin is started before four months of age.[4] If the child has no regular source of primary pediatric care, the program will find the family a pediatrician. The program also provides each family with the opportunity for genetic counseling. CMS will cover primary care, all recommended vaccinations and medications, as well subspecialty care for eligible sickle cell patients up to three years old. Coverage for older children is considered on a case-by-case basis. Working with the pediatric hematology community and the Maryland Chapter of American Academy of Pediatrics, recommendations for the medical management of pediatric sickle cell disease consistent with the NIH guidelines have been developed.[5] Coordination of care, as desired by the pediatrician, is provided by a community health nurse who serves as case manager in the child's local community. Social and community support and educational services for families are provided by two community based sickle cell organizations, ASSERT, Inc. (the Association for Sickle Cell Services, Education Research and Treatment, Inc.), and the Maryland Chapter of the National Association for Sickle Cell Anemia. Together the groups reinforce genetic counseling and medical information, and provide home visits, parent and patient support groups, a summer camp and field trips for young patients, tutoring for school-age patients, and much needed emotional support. Ongoing pediatric hematology consultation for the patients is available, as desired by the child's pediatrician, and on a yearly basis through the regular visits of the pediatric hematologist to the outreach genetics clinic in the patient's community. (Alternatively, the patient may visit the hematologist's office, if that is more convenient.)

This is a young program, but the results are encouraging. Since the beginning of the program in July 1985, over 200 children with sickle cell disease have been identified and none have died as a consequence of their sickle cell disease. Unfortunately, since the loss of a program previously funded by the Maryland Chapter of the National Association for Sickle Cell Anemia and implemented through several major hospitals in the state, there is no comparable case-management program for adults.

The DHMH provides free hemoglobin screening to approximately 21,000 older children and adults yearly through the Hemoglobin Disorders Laboratory. The screening of high-risk children is part of the EPSDT (Early Periodic Screening and Developmental Testing) protocol, and it is standard-of-care to offer hemoglobin screening to maternity and family planning patients receiving state-sponsored care. Genetic counseling and prenatal diagnosis are available to couples at risk for having offspring with sickle cell disease.

Alpha-fetoprotein Screening

The DHMH Alpha-fetoprotein (AFP) Screening Program for Improved Pregnancy Outcome offers free AFP testing to all maternity patients receiving state-sponsored prenatal care. Samples on other patients who are unable to obtain testing from the private sector are also accepted. The simple noninvasive blood test is drawn between 16 and 18 weeks gestation. As with all genetic tests, participation is entirely voluntary and requires informed consent. Brochures and consent forms are available to assist the health professional in discussing the test with patients. The program includes laboratory, follow-up, and counseling components. As is well known, elevated levels of maternal serum AFP are associated with neural tube defects, ventral wall defects, and a variety of other birth defects. Low levels of maternal serum AFP are associated with some chromosomal anomalies, notably Down syndrome. Elevated AFP levels, in the absence of definable fetal defects, also may be associated with an increased risk of pregnancy loss, prematurity, or low birth weight.[6] Since interpretation of test results is complex, dependent on gestational age and numerous fetal and maternal factors, abnormal test results require careful evaluation and further testing. Abnormal test results are, as in other genetic testing programs, immediately phoned to the referring physician by a physician or nurse from the program. Consultation with respect to the timely arrangement of appropriate follow-up testing is offered. Follow-up testing, including specialized sonography or amniocentesis, and genetic counseling is available at the genetics centers. Follow-up services for patients recev-

ing state-sponsored maternity care are available through the Division of Human Genetics at the University of Maryland. The program serves approximately 12,000 patients each year.

Birth Defects Reporting and Information System

Title 18, Section 206 of the *Annotated Code of Maryland* requires hospitals to report to the DHMH infants born with any of the 12 specific birth defects specified by the World Health Organization. This program collects data on the incidence of such defects in Maryland. The data are used in epidemiological, etiological, and clinical service-delivery related studies. A previous *Maryland Medical Journal* article describes the system in detail.[7] The major use of the data at present has been to improve the allocation of state resources by building a better profile of which services are needed, and in what numbers, in each geographical area.

In addition, the program offers information about birth defects and about the services available to children with such defects and to their families. It offers brochures on the various defects and on the more general problems of having a child with a birth defect, which health professionals may find useful for their patients. The most popular are: *Special Information about Special Babies*, for parents whose children have a good prognosis; *Parenting the Child with a Serious Birth Defect - You Are Not Alone*, appropriate for families when there is a poor or guarded prognosis; and *Questions, Answers and Help for Parents After Stillbirth or Infant Death*, for families who have lost a baby. For many birth defects, the program relies on the excellent materials produced by the March of Dimes. There is no charge for the informational or referral services of the program. Approximately 500 families are served each year.

Educational Services

The Division of Hereditary Disorders, DHMH, offers an active educational program for health professionals and lay groups and has been working with science teachers throughout the state to enrich the genetics curriculum in the public schools.

The Division both responds to requests to provide particular programs for interested groups and presents regular cycles of programs for its traditional audiences. Maryland is fortunate to have a concentration of eminent geneticists at local institutions, and the Division is, therefore, able to attract distinguished speakers for many of its programs. There is no charge for the program's educational services.

Working with Voluntary Groups

From the public health perspective, one of the most important recent developments in genetics is the increase in the number and activity of genetic disease voluntary groups. The Maryland genetics network exists primarily to provide services to patients with genetic disorders and to their families. The genetic disease voluntary organizations are invaluable and energetic partners in this endeavor. These groups usually consist of patients, their families and friends, and other individuals interested in a particular disorder or related group of disorders. They have (at least) three unique contributions to make to the professional-voluntary partnership in support of the patient.[8, 9]

First, they can extend the services that health professionals provide. In a voluntary group, the health professional finds a dedicated group of people who have, through experience, become very knowledgeable about a particular disorder and its problems. Reputable voluntary groups are an excellent resource for reinforcing the physician's explanations and instructions to the patient or for assisting a new patient in complying with a complex medical regimen. They can sometimes spend hours working on an issue with a patient while the physician can only spend a few minutes. Further, they can "validate" what the health professional says. Hearing the mother of another child with a given disorder say that the medication is important and that it really helped her child makes a much stronger impression than a health professional's biochemical explanation. The voluntary group members can give emotional support in a unique way. They, too, have been there. They will often develop resources or work on important nonmedical problems associated with the disorder such as appropriately fitting clothing for patients with skeletal dysplasias or appropriate schooling for youngsters with disorders affecting intellectual development.

Second, voluntary groups are terrific advocates for proper funding and resource allocation for both clinical services and research on "their disorder." They also advocate programs of general interest to the entire genetics community. Many genetic disorders are rare, and at some point in setting priorities for the allocation of funds, issues of "the greatest good for the greatest number" arise. Therefore, voluntary groups have recently begun to form alliances to increase the effectiveness of their advocacy programs.[10] They have found many issues of common interest such as medical insurance coverage. A national coalition of genetic voluntary groups, the Alliance of Genetic Support Groups, based in Washington, DC is beginning to have a significant input on federal health care financing issues. NORD (the National Organization for Rare Disorders) has been instrumental in the passage of the orphan drug legislation which is intended to promote the development of drugs for rare disorders. Such drugs, because of their small potential market, would ordinarily not be cost effective for a pharmaceutical company to develop. Sometimes voluntary groups directly fund grants for clinical services or research. Although such grants are usually small, they often provide the seed money for preliminary studies

enabling the professional to apply for major funding elsewhere.

Third, voluntary groups have much to teach health professionals. Not only can they teach us to avoid inadvertent insensitivity in our dealings with patients, but also they may have very useful data bases to share. For the specialist, they may have valuable patient registries, useful in locating persons interested in participating in epidemiological studies, syndrome delineation studies, clinical trials, or basic research projects. For the general practitioner they may have textbook level material, lists of consultants, bibliographies, or literature summaries on various diseases that are useful when faced with a puzzling diagnostic problem.

The physician caring for a patient with a genetic disorder or a rare disease may wish to refer the patient to the appropriate voluntary group. Such groups may offer emotional support, peer counseling, patient or parent discussion groups, much practical advice in coping with the myriad effects of the disorder, literature about the disease written for patients (and sometimes for professionals), summer camps or social events for affected persons, tutoring, small grants to cover medical expenses or equipment, and so on, and a sense of belonging to a caring community. Of course, voluntary groups vary in the range services they offer, as well as in their effectiveness, stability, and sophistication. The Division of Hereditary Disorders, DHMH; the Alliance of Genetic Support Groups[11]; NORD[12] ; or the National Center for Education in Maternal and Child Health (NCEMCH)[13] can assist the physician in locating a reputable and appropriate voluntary group. NCEMCH has published a directory of such groups.[14]

Cost of Genetic Services to Patients

The members of Maryland genetics network work cooperatively to provide genetic services to the population and have worked to make high quality, cost effective services available. However, the network's goals will not be achieved unless the services can be utilized by those who would benefit from them. Potential patients face (at least) three major types of barriers to obtaining services: educational or attitudinal barriers, geographical barriers, and economic barriers.

The network attempts to overcome educational barriers on the part of potential patients through its various brochures and lay educational programs, especially its new public school genetics curriculum. It is hoped that by introducing human genetics into the school curriculum, an entire generation of young people will emerge with an understanding of genetic disease and of the capabilities and limitations of medical genetics. Knowledgeable people will be more accepting of those members of our population who are affected by genetic disorders, will recognize when medical genetic services could be of potential benefit to themselves, and will not feel there is any stigma associated with the use of such services.

The network has attempted to overcome geographical barriers to accessing services by providing services through a system of 4 centers and 14 outreach clinics. The most commonly needed clinical services usually can be provided in a prospective patient's community or a nearby community.

Unfortunately, economic barriers to obtaining genetic services are difficult to overcome. The network attempts to minimize economic barriers to service by merging the contributions of state government, federal government, university medical centers, and voluntary organizations into a program of services that no one sector could provide alone. The DHMH provides screening and informational services free of charge and contributes coordination and case-management services for some high-risk individuals. Medical assistance and CMS contribute to the ongoing medical care of eligible patients. A sliding-fee scale for those services available through the outreach clinic network is in place for patients without third-party coverage.

The partial subsidy structure of the grant program allows extremely cost-effective use of available governmental funding. Nevertheless, access to some genetic services will be limited for some potential clients because of economic reasons. Often third-party reimbursement does not cover the full cost of obtaining or providing the services. Three projects funded through the federal Department of Health and Human Services recently studied reimbursement issues in genetics, defined the current problems, and offered some solutions.[15] Many of the problems studied are issues in any area of health care, but some are unique to genetic services delivery.

Historically, clinical genetic services have been subsidized by research and service grants and, in the past, patients were not charged directly. As these services (such as diagnostic evaluation, chromosome analysis, and amniocentesis) became incorporated into routine medical care, federal, state, and foundation subsidies declined and patients were increasingly expected to pay for the services. Fortunately, genetic services have remained accessible to many patients because third-party payers, including medical assistance, have begun to provide some coverage.

Genetic services emphasize patient education and regularly involve the participation and possible testing of many family members. Therefore, from the provider point of view, genetic services are labor and time intensive. Typical charges for some genetic services (obtained by surveying Maryland providers) are outlined in Table 3. The charges for the cognitive services (diagnosis, management, and counseling) are rarely high enough to cover the personnel costs incurred in providing the services, and the actual payment received is typically less than 80 percent of the amount charged.[16] Some commonly provided clinical genetic services, such as genetic counseling, are not covered by many third-party payers, including the

Table 3. Typical Charges for Genetic Services

Service	Charge
Comprehensive new patient clinical genetics consultation	$250
Intermediate (follow-up) consultation	80
Genetic counseling	125
Chromosome analysis - peripheral blood	450
Chromosome analysis - amniotic fluid or chorionic villus	650
Amniocentesis - procedure charge only	350
Chorionic villus sampling - procedure charge only	350

Maryland Medical Assistance Program, because the professionals who provide counseling (master's level genetic counselors) are not licensed and generally not considered as reimbursable providers by third-party payers. Therefore, genetic services are rarely self-supporting.[16]

The extent to which economic factors affect genetic service accessibility and utilization has not been well studied. Although federal and state officials have long advocated that genetic services, especially newborn screening and AFP testing, should be available to all persons regardless of ability to pay, government funding for the services has been inadequate in many areas of our country.[17] For the consumer who has or is at risk for a genetic condition, obtaining genetic services usually depends on having adequate health insurance coverage for the services needed or otherwise being able to afford them. Whether individuals who have or who are at risk for a genetic condition are disproportionately uninsured or underinsured is unknown.[18] There are many anecdotal reports of individuals who are denied insurance because of a preexisting genetic condition. For insured individuals, many needed medical services, such as DNA diagnosis or genetic counseling, may not be covered by insurance. Serious gaps in coverage may result in inadequate treatment or service inequities. For example, newborn screening for inherited metabolic disorders may be offered free of charge, as it is in Maryland, but the special formulas required by the affected children may not be covered by insurance. In many other states, prenatal diagnostic services for indigent women are covered through Medical Assistance, but the termination of an affected pregnancy diagnosed through amniocentesis is not a covered service.[19]

Maryland is fortunate in both the comprehensive nature of the genetic services available in the state and in their relative accessibility, however, much work remains to be done to ensure that each of Maryland's citizens receives optimal genetic services.

Gaps in Service: Patient/Family Perspective

Rita Beck Black DSW and Joan O. Weiss ACSW

Author Black is Associate Professor, Columbia University School of Social Work, New York, NY. Weiss is Coordinator, Alliance of Genetic Support Groups, Washington, DC, and Consultant, The Johns Hopkins Center for Medical Genetics, Baltimore, MD.

Correspondence: *Rita Beck Black, Columbia University School of Social Work, 622 W. 113 St., New York, NY 10025.*

Support for this project was provided by Grant No. 14-74 from the March of Dimes Birth Defects Foundation and Grant No. MCJ-009114-01-0 from the Bureau of Maternal and Child Health and Resources Development, Department of Health and Human Services.

Findings from a national survey of members of 15 genetic support groups indicate difficulties in obtaining desired genetic information because of delays in finding appropriate professional resources, lengthy travel time to those resources, financial costs, and limited flexibility in appointment schedules. Genetic disorders spawn a wide variety of needed services in the community, with supportive counseling, budget/financial planning, and help with applications to government programs least likely to be received when needed.

The 1970s and 1980s have witnessed a rapid and impressive growth in genetic information, technologies, and clinical programs. With these developments has come recognition of the complex service needs generated by many genetic disorders and remaining gaps in delivery of genetic and related services.

On further consideration, it becomes clear that the concept of a "gap in service," which emphasizes a lack of specific programs or resources, is itself inadequate for explaining the problems that genetic patients and their families experience in getting needed services. It also is helpful to consider the issue of "access," that is, looking at the varied factors that influence both whether patients can obtain available services (barriers to access) and whether patients can make optimum use of services they do receive.

We will consider the question of gaps in genetic and related services by looking at difficulties patients experience in obtaining services as well as problems they encounter due to the manner in which those services have been provided. We also look at some efforts under way to address the identified problems.

Materials and Methods

The main data presented here come from a survey of members (hereafter, the members' survey) of organizations in the Alliance of Genetic Support Groups as of January 1988. A total of 15 out of 24 groups (62.5 percent) participated in the project, and questionnaires were completed by 33 percent (n=931) of the people on their mailing lists. Return rates varied from virtually no response by members of two organizations for sickle cell disease, up to 60 percent from members of the Mucopolysaccharidoses Society.

(See Appendix for a complete list of organizations in the members' survey and their return rates.)

Respondents were largely female (726; 78 percent), Caucasian (873; 94 percent), currently married (721; 78 percent), working outside the home (571; 63 percent), and at least partially college educated (583; 63 percent). The majority were parents of affected children (665; 74 percent), although close to one third (299; 32 percent) had a genetic disorder themselves, and 95 (10 percent) reported both they and one or more children had a genetic disorder. Overall, 774 (83 percent) either were parents of affected children and/or had the disorders themselves.

This sample thus does not fully represent the needs of adults with genetic disorders, experiences of persons from racial or ethnic minority groups, or the unemployed and less-educated patients who have genetic disorders. Nevertheless, it does provide a look at the experiences of a large, national sample of genetic patients and their families, people who have been able to make contact with a relevant voluntary genetic organization.

Although they are likely to be among the more "successful" in obtaining services, their difficulties also can alert us to the possibly greater problems encountered by patients with fewer resources at their disposal.

Table 1. Barriers to Receiving Genetic Information (n=931)

Barrier	Very Much a Problem (percent)	Some Problem (percent)	Little / No Problem (percent)	No Reply (percent)
Limited professional knowledge	53	24	18	5
Difficulty finding genetic information	27	31	35	7
Lengthy travel time to professional sources	24	27	39	10
High financial costs/ lack of insurance	24	21	42	13
Lack of flexibility in appointment scheduling	7	19	58	16

Table 2. Satisfaction with Genetic Services (n=931)

Service	Very (percent)	Somewhat (percent)	Not at All (percent)	No Reply (percent)
Warmth, empathy interest	48	30	14	9
Conduct of physical exam	47	32	11	11
Length of time	42	37	13	9
Communication	41	34	16	10
No. appointments	40	36	12	12
Extent concerns addressed	39	36	15	10

Obtaining and Using Genetic Services

Participants in the members' survey were asked to respond to a series of questions that addressed possible informational as well as more concrete barriers to obtaining the genetic information they wanted. As shown in Table 1, limited professional knowledge about specific disorders often was recognized as the limiting factor in a family's quest for information. However, difficulties in locating appropriate professional resources created problems for many. In addition, such practical issues as lengthy travel time to reach professional sources, financial cost, and lack of flexibility in appointment scheduling also to some degree obstruct access to obtaining desired amounts of genetic information.

As shown in Table 2, the majority of respondents were at least somewhat satisfied with the manner in which professionals had provided them with genetic information and related services. Their positive ratings included both the structure of services, the number and length of appointments, as well as the manner in which professionals provided information, conveyed interest and warmth, addressed clients' concerns, and conducted physical examinations. However, these positive evaluations should be viewed in the context of the 12 to 18 percent of respondents who were not at all satisfied with these same aspects of genetic service delivery.

Qualitative review of written comments confirmed their generally positive experiences with genetic services, punctuated by pointed descriptions of distressing and stressful encounters. Too often difficulties in finding knowledgeable health professionals had created long delays in finding appropriate treatment, and in some instances families reported bearing additional affected children before becoming aware of any genetic risks associated with the first child's disorder. Many families had felt forced to do much research on their own to locate appropriate specialists. Indeed, families often became more expert about the disorder than their primary care physicians and other therapists. Some believed genetic counselors had been directive and perhaps judgmental in urging them to have no additional children. Others said they thought they or their loved one had been viewed as a "guinea pig" or as a "disease not a person."

Living with Genetic Disorders: Obtaining and Using Services

Genetic diagnoses often precipitate both acute and chronic stresses that can have an impact on individual and family functioning and generate a variety of service needs over time.[1]

Table 3 summarizes responses about a range of possible service areas listed by the frequency with which

needed services were **not** received. Although these data show the majority of respondents either did not need a given service or were able to obtain it, the services of supportive counseling, budget/financial planning, and help with applications for various government programs were more likely not to be received by those who needed them. Many other services were needed but not received by a minority of respondents. Although the specific ordering of Table 3 would change depending on the particular needs of each genetic disorder, these responses do confirm the frequency with which genetic patients and their families use a wide range of community resources and the persisting difficulties some families face in obtaining what they need.

In written comments respondents elaborated on the struggles they sometimes encountered before obtaining needed services and the sometimes less-than-satisfactory nature of services received. Most frequently described were difficulties in obtaining approval for Social Security Disability and other government and insurance entitlements, often due to officials' lack of knowledge about rare genetic disorders and their consequences. Individual and family stresses because of the costs generated by the illnesses also were noted with some frequency.

Programs that could provide respite and/or home care were described with notable urgency as inadequate or unavailable. Moreover, even for the many who reported successfully obtaining services, the time and energy required to located and arrange for those services often became additional burdens of the disease. As result of their experiences, respondents called for professionals to stay up-to-date about rare disorders in their patients, to listen to patients' and families' concerns and viewpoints, and to take responsibility for helping families with referrals to other specialists, mental health resources, support groups, and any other pertinent providers.

Filling the Gaps

Initiatives now under way attempt to address some of the service difficulties families have identified. While an exhaustive review of these efforts is beyond the scope of this article, a few highlights will illustrate these positive developments.

The ten Regional Genetics Networks, established under the auspices of the Office of Maternal and Child Health, Bureau of Maternal and Child Health and Resources Development, Department of Health and Human Services, provide an important base for coordinating genetic services. Each network links the genetic programs in the states of that region, and all come together under the Council of Regional Networks for Genetic Services (CORN). Priorities of CORN include enhancing the quality of genetic services, genetic education, networking, laboratory quality assurance, and uniform data gathering. Maryland is represented in the Mid-Atlantic Regional Human Genetics Network (MARHGN), which publishers a regular newsletter reporting on events and programs in the region.

The Office of Maternal and Child Health also supports the National Center for Education in Maternal and Child Health. The Center was established in 1982 with a mission to provide information services, educational materials, and technical assistance to organizations, agencies, and individuals with maternal and child health interests. The Center publishes a specialized directory of voluntary organizations for genetic disorders in addition to a directory of a wider variety of organizations related to maternal and child health.

The March of Dimes Birth Defects Foundation and the Office of Maternal and Child Health have combined resources in recent years in a series of projects designed to highlight the comprehensive service needs of families with genetic disorders and the important contributions being made by genetic support groups.

Table 3. Services Frequently Unavailable to Respondents (N=931)

	Needed but Not received (percent)*	Needed and Used (percent)*	Not Applicable (percent)*
Supportive counseling	35	33	32
Budget/financial planning	30	14	56
Applications	28	25	47
Help obtaining insurance	24	24	52

Special education	6	40	54
Nursing home placement	5	4	91
Foster care, adoption, residential placement	3	5	92

*Percentages were calculated as proportion of answered items. Nonresponses (not shown) varied from 4 to 8 percent across items.

The first such project was a major national conference, "Genetic Disorders and Birth Defects in Families and Society: Toward Interdisciplinary Understanding," held in 1983 in Baltimore.[2] This meeting brought affected individuals and families together with geneticists, psychologists, social workers, nurses, and the many others who provide services for families with genetic disorders. The success of this meeting paved the way for a second conference, also supported jointly by the March of Dimes Birth Defects Foundation and the Office of Maternal and Child Health. "Genetic Support Groups: Volunteers and Professionals as Partners," held in June 1985, in Washington, DC, assembled participants from over 92 different support groups, serving at least 55 different disorders.[3] Professional enthusiasm for the event was so high that attendance by professionals had to be limited to maintain the desired majority of support group members. A survey of conference participants[4] confirmed the significant contributions being made by the genetic organizations and their interest in working with professionals to improve services.

An immediate outgrowth of these conferences was the formation in 1985 of the national Alliance of Genetic Support Groups (hereafter, the Alliance). Its stated purpose is to promote optimum health care and social and psychological functioning for individuals and families affected by genetic disorders. By strengthening collaboration and communication between consumers and providers of genetic services, the Alliance seeks to increase awareness about genetic disorders, to improve the availability and accessibility of high quality genetic services, and to enhance education about the needs of affected individuals and families.

The Alliance has set as a current priority the establishment of linkages between the Alliance and voluntary, governmental, and professional organizations concerned with genetic services at local, state, regional, and national levels. Special emphasis is being given to strengthening ties between the Alliance and the Regional Genetics Networks throughout the country.

Other specific plans of the Alliance include establishing a subcommittee on Service to Adoptive Families that will develop linkages between adoption agencies, adoptive families, and genetic services. They also will sponsor a workshop at the annual meeting of the American Society of Human Genetics in November 1989, "Genetic Support Groups: A Partnership of Families and Professionals," which will focus on ways consumers and professionals can work together on such shared concerns as promoting responsible and ethical research activities, developing patient support services to supplement basic medical care, and advocating for more equitable reimbursement policies and health care financing.

Conclusions

The data here describe the experience of a large, national sample of patients and families who are living with genetic disorders. Their responses highlight the reality that although gaps in genetic and community services often are the result of limited funds for specialized services and training, such gaps are only part of the story. There also are major gaps in our current system's ability to link people with rare genetic disorders to the most qualified professionals.

Admittedly, genetic and medical knowledge remains quite limited for all-too-many disorders, and for families with those disorders no amount of searching will uncover "an expert." However, survey respondents more often said that although they eventually found knowledgeable professionals, their successes came only after long, arduous searches and encounters with inappropriate providers. For some families, this struggle occurs at the first stage of trying to obtain a correct diagnosis; other spend years before they find educators or therapists skilled in working with patients with certain disorders. Such efforts require personally costly expenditures of a patient's or parent's time, emotional energies, and money. Moreover, the patients and family members who joined genetic support groups and who answered this survey generally were those who eventually had found the correct genetic diagnoses and treatments. How many families never obtain appropriate care remains unknown.

It is beyond the scope of the present investigation to attempt to explain the underlying causes of the service gaps noted by respondents. However, patients with the life-long conditions generated by genetic disorders share with other chronically ill patients the burden of negotiating the still highly fragmented, specialized, and acute-care oriented health care system of the United States.[5,6,7] Current initiatives to improve genetic services, such as the Regional Genetics Networks and the Alliance of Genetic Support Groups, appear as hopeful signs because they recognize the complex challenges involved in developing a truly comprehensive system of services for patients and families with genetic disorders. These efforts call for the work of a trio of participants: genetic specialists, community professionals, and genetic support groups.[8] Working together as colleagues in local, state, regional, and national services networks and advocacy coalitions, this trio will make progress in filling the gaps.

Eight physicians and four medical office managers tell "all" about automation.

"Before we automated, our cash flow would stop for a month at a time. Now there's a more regular cash flow."

"We didn't add or subtract people. We just get more work done in the same amount of time."

"Now it takes just one hour to bill 3,000 accounts."

"If a patient didn't show up, I never knew it. Now, we can contact those who miss their appointments."

What can automation do for you?... What can't it do?... Is it practical?... What should you look for in a system?... What should you expect from the company who sells you the system?... How will it affect your staff?... And how do you go about getting the answers to all these questions?

KTI can help. As the systems supplier to over 3,000 healthcare professionals, we brought together a group of physicians and medical office managers to talk about the benefits and cautions of automation. And prepared a special report on their thoughts and comments.

If you want the advantage of their experiences, send us this coupon. And you'll get a lot of answers in just a few minutes of reading.

Prenatal Genetic Concerns

C. Lynn Keene MD and Devereux N. Saller, Jr., MD

Dr. Keene is Assistant Professor of OB/GYN, Divisions of Maternal-Fetal Medicine and Human Genetics, University of Maryland Hospital, Baltimore. Dr. Saller is Assistant Professor of OB/GYN, Division of Maternal-Fetal Medicine, Women and Infant's Hospital of Rhode Island, Brown University, Providence, Rhode Island.

The obstetrician-gynecologist is in a unique position to provide information to couples with prenatal genetic concerns. However, all health care providers should be aware of the available standard genetic screening tests as well as special studies that may be indicated for the pregnant patient.

The role of the prenatal caregiver is to provide education to patients believed to be at increased risk of having a child with a congenital anomaly. The population risk for major congenital anomalies is approximately 3 percent, about half of which are evident at birth. The remainder are discovered later in childhood or, more rarely, in adulthood. Patients at increased risk need assessments of that risk; information concerning availability, specific risks, and benefits of testing; and, above all, support for decisions reached after comprehensive counseling.

Family History Analysis

Questions about familial occurrence of disease are an important component of any complete medical evaluation. The initial preconceptual or prenatal history should focus on this point. In addition, inquiries should include both maternal and paternal families with specific information sought concerning the occurrence of miscarriages, fetal and/or neonatal deaths, congenital anomalies, or mental retardation.

A history of unexplained, spontaneous, multiple miscarriages prompts concern that one of the parents could carry a balanced translocation. In approximately 7 to 10 percent of couples with two or more miscarriages, one member is a translocation heterozygote. This information is vital in planning comprehensive prenatal testing.

Even following an exhaustive investigation, fetal and neonatal deaths are often difficult to explain. Nonetheless, all records from previous losses must be scrutinized to extract any additional information that could prove helpful in preventing a recurrence. Three genetic mechanisms may operate to lead to poor pregnancy outcome. If a previous fetal or neonatal death were due to autosomal trisomy, then the risk of having a second child with a trisomy will be approximately 1 to 2 percent. A second concern is a Mendelian or single-gene disorder with recurrence risks that are much higher.

Autosomal recessive disorders will impose a 25 percent recurrence risk on couples and include such disorders as infantile polycystic renal disease, the lethal type of multiple pterygium syndrome, and Meckel syndrome (CNS abnormalities, dysplastic renal disease, and polydactyly). The number of autosomal recessive disorders leading to fetal and neonatal death is quite large and underscores the importance of performing detailed evaluations of fetuses and infants that are lost in the perinatal period. A third consideration is polygenic or multifactorial disorders (Table 1). Many of the physical abnormalities associated with multifactorial inheritance are also seen in infants with either chromosome abnormalities or Mendelian disorders; exclusion of these causes is important before deciding that a disorder is multifactorial. Following the birth of one child with a multifactorial condition, the recurrence risk in future pregnancies is 1 to 5 percent.[1]

The causes of mental retardation (MR) are multiple and can result from the three genetic mechanisms already discussed: chromosome abnormalities (numerical and structural), Mendelian syndromes, and multifactorial disorders. Brief consideration should be accorded the Fragile X syndrome, which may account for up to 25 percent of MR in males. The fragile site on the X chromosome is most often noted in studies of the affected male. The carrier female frequently may be of normal intelligence and not demonstrate the fragile site on cytogenetic analysis. The exclusion of the Fragile X syndrome is best done by preconceptual identification of a family at potential risk (unexplained mental retardation in male family members) and doing the chromosome studies of the affected males.

A complete family history includes information about the health of all first-degree relatives (parents, siblings, and children), second-degree relatives (aunts, uncles, nieces, and nephews), and third-degree relatives (first cousins). Since few obstetricians in a busy practice have time to construct a three-generation pedigree, general screening questions are often useful to determine which patients may be at increased risk. Some practitioners obtain this information by asking that patients fill out a form that is integrated with other historical information.

It is important that the reaction to YES answers is appropriate. For example, if a patient states her sister has a child with Hurler syndrome (an autosomal recessive mucopolysaccharidosis), the risk for her child is very low (given a nonconsanguineous marriage) because the gene frequency in the population is quite low. This reasoning is correct with rare autosomal recessive disorders. If, on the other hand, the patient has a female maternal first cousin with a son with Hemophilia A (an X-linked recessive disorder), this patient will require further testing to help clarify whether she is a carrier of the gene.

The form or method of collecting family information from patients is less important than obtaining it with appropriate reactions to the positive answers that are elicited. If integrated into the collection of other historical information, the time spent can be minimized with a high yield for the at-risk patient.

Screening Tests

Several diseases are common enough in certain ethnic groups to warrant screening of couples who present for prenatal care. It is important to remember that while the gene frequency for the disease in question is higher among these specific ethnic groups, the gene also exists in other population groups. This explains the recommendation to screen couples even though only one individual may have originated from the ethnic group in question. Table 2 lists some diseases for which screening is available, the population groups most commonly at risk, and both the initial screening and definitive testing advisable.

Table 1. Polygenic / Multifactorial Traits

Hydrocephaly (exceptions include some forms of aqueductal stenosis and Dandy-Walker syndrome)

Table 2. Genetic Screening

Ethnic Group	Disorder	Initial Screening Test	Definitive Screening Test
Ashkenazi Jews	Tay-Sachs Disease	Decreased serum hexosaminidase A	CVS or amnio for assay of hexosaminidase A
Black	Sickle cell anemia	Sickle prep with confirmation by hemoglobin electrophoresis	CVS or amnio for direct molecular studies
Greek-Italian	β-Thalassemia	MCV < 80% with diagnosis by hemoglobin electrophoresis	CVS or amnio for direct molecular studies or RFLP (indirect) analysis
Southeast Asian Filipino	α-Thalassemia	MCV < 80% with diagnosis by hemoglobin electrophoresis	CVS or amnio for direct molecular studies

Availability of AFP Screening on Maternal Serum

Beginning in the early 1980s, the first of a number of available genetic screening tests for the general obstetrical population came into popular use. Maternal serum alpha-fetoprotein (MS-AFP) testing has become a standard of obstetric care in most parts of the United States, including Maryland. MS-AFP testing was initially implemented in the United Kingdom and then in the United States as a method of screening for open neural tube defects. Additionally, the early diagnosis of ventral wall defects, multiple gestation, and incorrect gestational age were recognized as benefits of this screening.[2] More recently the association of low MS-AFP with Trisomy 21 (as well as other autosomal trisomies) has been recognized.[3] Interestingly, those patients with "unexplained" high MS-AFP levels appear to be at higher risk for other obstetric complications such as fetal death, intrauterine growth retardation, placental abruption, and preterm birth.

Alpha-fetoprotein is a 70,000 dalton glycoprotein produced in the human fetus as early as 29 days of fetal life. Its concentration in fetal serum rises rapidly throughout the first trimester and decreases in the late third trimester and neonatal period to essentially negligible levels. The function of AFP in the fetus remains unclear but it may be a precursor to albumin or have immunoregulatory functions.

AFP transudates from the fetal serum into the amniotic fluid and subsequently into the maternal serum in the early second trimester. In the early 1970s it was noted that maternal serum and amniotic fluid levels of AFP were increased in pregnancies affected by open neural tube defects.

Since the concentrations of AFP differ in various body fluids by several orders of magnitude and since levels vary greatly with gestational age, AFP values are most easily reported and considered using Multiples of the Median (MoM) for specific gestational ages. Each laboratory determines its own standards but any value equal to or greater than 2.0 to 2.5 MoM is usually considered elevated. A low AFP is usually considered as any value less than or equal to 0.4 to 0.5 MoM. MS-AFP values may need to be adjusted for maternal weight, presence of diabetes mellitus, multiple gestation, and race.

It is recommended that all obstetric patients be offered MS-AFP testing at approximately 16 to 18 weeks gestation. In the 5 percent of patients with elevated initial studies, a repeat study is recommended. In the 3 percent of patients in which both values are elevated, genetic counseling and ultrasound examination (to eliminate the possibility of multiple gestation, fetal demise, or incorrect gestational age) are indicated, and amniocentesis for determination of the more sensitive amniotic fluid AFP value and fetal chromosomes should be considered.

A low AFP value is usually not repeated but indicates the need for ultrasound examination and genetic counseling as well as the consideration of amniocentesis. By utilizing charts constructed to combine the risks associated with MS-AFP and maternal age, a single risk figure for Down syndrome can be given. This powerful tool allows the possibility of identifying 20 percent of all Down syndrome pregnancies in women under age 35. Research is now ongoing to identify additional parameters (such as maternal serum estriol or HCG) that may, in the future, identify an even larger proportion of aneuploid pregnancies.

Use and Indications for Ultrasonography

Without question, ultrasonography has revolutionized contemporary obstetrics. Its use has refined the assessment of gestational age, evaluation of fetal anomalies, and estimation of fetal growth and development. Ultrasound has enhanced the development of prenatal diagnostic techniques including amniocentesis, chorionic villus sampling, percutaneous umbilical blood sampling, and fetal intravascular transfusion.

In many countries, the use of screening ultrasonographic examination in pregnancy is common. The use of routine ultrasound in the United States has been attractive both to patients and medical professionals, but its cost effectiveness as a screening technique has never been proved.

Early confirmation of correct gestational age facilitates the management of post-datism and intrauterine growth retardation. The early ultrasonographic detection of fetal anomalies provides women and their doctors valuable information and time in which to choose the optimal management for mother and fetus.

In 1984 an NIH Task Force evaluated routine obstetric ultrasound and concluded there is no knowledge of risk associated with ultrasonography, but a hypothetical risk is possible. Therefore, ultrasound should be employed only in conjunction with a specific indication (Table 3). Many patients will, at some time during pregnancy, manifest at least one of these indications.

Concerns of "Advanced Maternal Age"

The most common referral for prenatal testing procedures is concern over advanced maternal age. The increased risk is for maternal nondisjunction and is engendered by the increased age of oocytes, which began their meiotic activity in the second to third month of fetal life. At the time of birth, mitosis in the female germ cells is complete and only the two meiotic divisions remain. Activity is arrested in the female until puberty when oocytes start the division process again and complete meiotic metaphase II at the time of ovulation. When fertilization occurs the meiotic process reaches completion.[4] The "lag" time spent arrested in meiosis increases the risk for nondisjunction in the oocyte and the birth of a child with a trisomy.

The standard medical practice is to offer prenatal diagnostic testing to women who will be 35 years of age or older at the expected date of confinement (EDC). Because frequency of cytogenetic abnormalities begins

* 47, XXX excluded from ages 20 to 32 (data not available) Because of sample size for some relatively small 95 percent confidence limits are sometimes relatively large. Nonetheless, these figures are suitable for genetic counseling.

an exponential rise above age 30, providing risk information to these younger women may be appropriate. Table 4 lists the risks of both Down syndrome and all cytogenetic abnormalities as related to maternal age.

Procedures performed to provide samples for prenatal diagnostic testing include both amniocentesis and chorionic villus sampling.

Amniocentesis is most commonly performed at 15 to 18 weeks gestation and involves needle aspiration of 20 to 30 cc of amniotic fluid from the 200 to 300 cc that occupy the intrauterine space surrounding the fetus. A realtime ultrasound examination should precede the procedure to determine fetal and placental position.

In most medical centers a fetal anatomic survey also is performed to rule out gross structural anomalies (although this is not considered obligatory). Simultaneous monitoring of the procedure with realtime ultrasound has been demonstrated to reduce the complications of bloody taps, dry taps, and multiple needle insertions. The amniotic fluid is forwarded to the laboratory for routine analysis of both amniotic fluid AFP and cell culture for assessment of fetal chromosomes. Other biochemical and molecular testing is available if indicated.

The safety of second trimester amniocentesis has been studied extensively since its introduction in the early 1970s. The US Collaborative Trial sponsored by the NICHD between 1972 and 1975 showed a pregnancy loss rate of 3.5 percent in the study group with a 3.2 percent pregnancy loss rate in the control group. This difference of 0.3 percent has been widely quoted as the "risk" associated with amniocentesis, although the loss rates between the groups were not found to be different when statistical analysis was done.

Subsequent studies by experienced investigators with high quality ultrasound equipment have shown procedure-related loss rates of 1 percent or less. Investigators have questioned the findings of the original NICHD sponsored study because the control loss rate was higher than expected. An exact value for risk of procedure may be difficult to produce as risks relate to technique and experience of the obstetrician performing the procedure. Many centers currently report the risk of spontaneous abortion secondary to genetic amniocentesis to be 0.5 percent or less but not zero or near to that.[5]

Chorionic villus sampling (CVS) also obtains a tissue sample that is used for determination of fetal

chromosomes as well as for metabolic and DNA assays. CVS, however, cannot be used to obtain information about AFP levels. The technique involves taking a small biopsy of the chorion frondosum (developing placenta) with either a transcervical catheter or transabdominal needle. The advantage of CVS is that it is performed in the first trimester of pregnancy, between 9 and 12 weeks gestation. In the great majority of cases the result is normal and the parents can enjoy a tranquil pregnancy. If a fetal abnormality is detected, the parents and physician have time to select the optimal course of management.

It is not clear which CVS technique is safest. There are currently ongoing trials in the United States. Preliminary US and European data suggest that transabdominal procedures are at least as safe if not safer than transcervical procedures.

The preliminary results from the NICHD-sponsored Collaborative Trial suggest that the risk of spontaneous abortion after CVS is 0.8 percent higher than if amniocentesis were performed. However, this report included only transcervical procedures with differences in risk related to the site of the procedure.[6] Like amniocentesis, CVS risks are dependent on technique and experience of the performing obstetrician. In many centers the risks of the two procedures are comparable. As experience grows and the role of transabdominal procedures is better defined, obstetricians will be better able to advise patients about possible choices. The current situation requires advising women of their options and the prevailing state of knowledge including information about risks and benefits of both amniocentesis and CVS.

Fetal Anatomic Defect

The discovery of a fetal anatomic defect is a situation that has few equals in the life of a pregnant woman. The immediate questions raised by most patients can serve as a guide in the subsequent evaluation and management.

How did this happen? The most appropriate response is to provide available information but not to hesitate in admitting that several possibilities exist and that further testing may be necessary to identify a precise cause. An example would be the fetus with a neural tube defect, most likely secondary to polygenic or multifactorial causes. However, since the possibilities of chromosome abnormalities and genetic syndromes exist, further evaluation might include a detailed sonographic fetal survey and obtaining an appropriate sample for chromosome analysis. It is important to remind patients that while ultrasonography is very helpful, it cannot provide the information that can be immediately obtained once the child is born and a thorough physical examination is performed.

How serious is this problem? When all the information obtained from detailed ultrasonography (often including fetal echocardiography) and fetal chromosome analysis is completed, it is appropriate to continue the discussion about prognosis. At this point, it is helpful to recruit the assistance of pediatric colleagues (including specialists, when appropriate) to further discuss the problem at hand and to acquaint them with the family as they will ultimately be managing the neonate after birth.

What are the options? When a woman decides to continue her pregnancy, prenatal care plans may be modified to facilitate delivering the neonate in a more appropriate setting including an intensive care nursery with pediatric specialists available. When a defect with a poor prognosis is discovered in the third trimester, it is important to discuss further obstetric care, including delivery, with the family.

The field of prenatal diagnosis of congenital anomalies is expanding rapidly. A comprehensive work-up of many abnormalities may include referral to a genetics center. Establishing an etiology, if possible, is necessary if accurate recurrence risks for future pregnancies are to be given. For the foreseeable future, the ability to diagnose fetal abnormalities will certainly surpass the capability for effective treatment. However, research treatment protocols are available for a small number of malformations including posterior urethral valves and diaphragmatic hernias. Clearly, the role of fetal therapy is still evolving with a need to critically assess the risks and benefits of intrauterine intervention.

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, PIE Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. PIE Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

Assessment of Genetic Disorders: Pediatrics

R. Stephen Amato MD, PhD

Dr Amato is Chairman, Department of Pediatrics, and Director of Medical Genetics and Cytogenetics, Greater Baltimore Medical Center.

Genetic disorders are surprisingly common. With time, a genetic approach to human health and disease will be integrated into the practice of every clinician. The primary care physician is in the ideal position to provide genetic information to his/her patients and to orchestrate the care that many children with genetic disorders or birth defects require.

A knowledge of genetics and a sense of its value in patient care can be extremely beneficial to the pediatrician. The genetic approach to medicine takes cognizance of the absolute uniqueness of each individual and, in so doing, accommodates the wide variability of the same disease or condition when observed in separate people. The genetic explanation for individual variation is grounded in the molecular variations within and between genes and the enormous variation provided by recombination in the formation of gametes. These, added to sexual reproduction in a heterogenous population, make each person a unique model.

Even though we share groups of genes with others of similar ancestry, individual differences still prevail. The external differences recognized in portraits are clearly mirrored by the internal differences that prevent internal parts (organs or tissues) from being interchangeable without significant immunologic manipulation. The biochemist and the pharmacologist of necessity treat people (and organisms) as if they were clones, each reacting more or less in the same way. The complete physician realizes this is never true and, of necessity, must see patients as individuals.

Unfortunately, genetics is often perceived as an esoteric specialty outside the mainstream of clinical practice. In recent years the powerful tools of molecular genetics, now applied in clinical practice, have served to reinforce the notion that genetics is the domain of technology-oriented specialists. An additional factor serving to keep genetics out of the mainstream (and operating almost subliminally) is mistrust: genetics, when applied to humans, smacks of biologic predestination. The legacy of eugenics and the misadventures of racism serve to keep professionals and laypersons at a distance when human genetics is concerned.

Ultimately, genetics will be integrated into clinical practice in the same manner as have been cardiology, dermatology, neurology, and other subsets of medicine. When this is achieved, each primary care physician will be comfortable providing factual and correct genetic information to families.

Pediatric Problems of the Future

Preventive medicine in pediatrics has done more to extend life expectancy than have all the heart catheterizations, transplants, dialyses, cancer chemotherapies, and insulin injections combined. The challenge facing pediatricians is to maintain this level of health through preventive means, and to deal with those causes of morbidity and mortality that now account for a higher proportion of the problems of pediatric patients than was the case a decade or two ago. Common misconceptions make genetics seem less relevant to the busy practitioner. One notion is that genetic diseases are rare. Although it is true that individual genetic conditions may be infrequent, collectively they are common.

The leading cause of death in infancy is birth defects (many of which are genetic in nature) which account for almost 237 deaths per 100,000.

Compare this to only 15 deaths/100,000 for childhood accidents.[1] Furthermore, between 20 to 40 percent of pediatric admissions in the United States are due to problems relating to birth defects or genetic conditions.[2,3] Despite these impressive statistics, the notion persists that genetic problems are rare.

Overcoming Misconceptions

Mendelian (gene) disorders and chromosome problems are seen by every primary care physician. The "multigene predispositions" that may lead to problems such as spina bifida, cleft palate, congenital heart disease, diabetes mellitus, early heart attack, hypertension, etc. are common. Genetic disorders and genetic predispositions abound; some are amenable to specific therapy, some may be preventable, but in each case patient and family education can help individuals to cope and thoughtfully participate in their own care and their own health maintenance.

Another misconception is that genetic conditions must be associated with prior positive family history. A positive family history is probably the exception rather than the rule. Many inherited conditions result from new mutations that occur without warning. This is particularly true of autosomal dominant conditions such as achondroplasia and tuberous sclerosis, but it is also true of sex-linked conditions (for example, Duchenne muscular dystrophy) that happen as new mutations. Variable expressivity also can account for lack of prior positive family history. Individuals may not manifest enough signs or symptoms to trigger recognition or diagnosis of the condition.

Autosomal recessive conditions also frequently occur without prior history. Only when both parents are carriers will some (25 percent) of the children be affected. To have a positive prior family history, these same conditions must have been met previously. Chromosomal disorders also typically happen *de novo*. Chromosomal aneuploidy happens randomly in gamete formation or in embryonic cell division (although with a predeictable frequency in a population). Most such events seem to be "biological lottery" phenomena based on chance.

Still another misconception that inhibits the rigorous pursuit of a genetic diagnosis is the question of "what difference does it make?" This notion fails to take into consideration the possibility of recurrence in an uninformed family or the important emotional and psychological resolution that a diagnosis can provide in helping a family cope with an unusual condition, gain entry into a specific disease support group, or obtain targeted funds for care. People want to understand their illness and their close relatives' illnesses as well as the risks for other family members. This interest is not confined to genetic disorders. It may be well for all diseases to be discussed in the *genetic information and assessment* format that is used in some manner by most geneticists discussing a condition with a family. This format includes a discussion of the *nature of the condition*, the *mode of inheritance or transmission* (if any), the *recurrence risks*, the opportunities for *early diagnosis or prenatal diagnosis*, the *prognosis* in general terms, and treatment *alternatives*.

A problem that can lessen the value of a health professional's discussion of a genetic disorder with a family is the assumption that people with the same genetic disorder will be much alike or at least similar in their expressions of the condition. This initial naivete disappears with experience. Even sickle cell anemia (which is always due to the same mutation in the beta-globin gene) turns out to be quite variable from person to person.[4] The practitioner who generalizes about a condition on the basis of limited experience or a textbook description can provide misleading information. A genetics consultant, because of having seen a wide spectrum of examples of a condition may be helpful with a matter-of-fact rather than an incredulous approach. This can be especially valuable when the condition confronting the family has a distorting cosmetic effect.

Another pitfall in communicating with families is the assumption that the families' interests are the same as the health professional's. Even the geneticist who professes to be "nondirective" has problems when a family seems to disagree with conventional wisdom. A simple but common example is when one is talking to a hearing-impaired couple. The professional may consider an adverse outcome to be the birth of a hearing-impaired child, but the couple may feel that the adverse outcome is the birth of a child with hearing. Society allows for a diversity of views, and this often is apparent when communicating about genetic problems.

There is a misconception among the general public,

often shared by professionals, that modern technology, especially prenatal diagnosis, will eliminate the majority of birth defects. Unfortunately, as described, most birth defects and genetic conditions occur without prior history. Even with prenatal diagnosis for chromosome disorders in "older" mothers, only a fraction of all chromosomally abnormal (aneuploid) fetuses will be detected. For example, if every age-appropriate candidate were to have prenatal diagnosis, the proportion of Down syndrome detected would only be about 33 percent. (This number will vary based on the percent of women in higher-risk categories who choose to have babies. The vast majority of mothers giving birth are in the "low-risk" 20 to 25-year-old range in the US.[1]) In one Baltimore hospital in a recent six-month period, 12 infants were born with Down syndrome. One mother was 34, one 31, and the remainder under 30 (range 20 to 28).[5] All had normal serum alpha fetoprotein levels and normal ("routine") fetal ultrasound examinations.[6] (Serum levels for chorionic gonadotropin or placental lactogen were not done, however.)

In the past, heredity has been overemphasized to the detriment of environmental factors. Now there is a tendency to overemphasize the importance of environment. This has led to the myth of the "cosmic bargain." This unstated bargain is that if a mother is healthy, observes good nutrition, avoids alcohol, cigarettes, recreational drugs, and so on, her baby will be fine. This myth is exacerbated by public awareness programs and education about the hazards of smoking, drinking, etc., and even professionals become coerced into accepting this myth. Proper nutrition, early prenatal vitamins (in moderation), and avoidance of tobacco and alcohol help *maximize outcome* but certainly do not guarantee an infant free from problems or birth defects. Fortunately, most term infants are healthy survivors of the rigorous demands of embryogenesis and fetal development. However, for those less fortunate couples who have a child with a problem, the guilt and responsibility associated with the cosmic bargain myth are considerable.

Diagnosis

A complete genetic assessment is dependent on a good diagnosis. One could argue that any patient coming to a physician is entitled to the best or most complete diagnosis possible. This need for a diagnosis easily can be extended to fetuses and stillborn infants as well as neonates and older persons. A diagnosis lessens ambiguity and uncertainty. Coupled with a discussion of the assessment of the condition, the prognosis, treatment alternatives, and recurrence risks for parents and family members, the diagnosis helps the individual or family come to terms with the condition and proceed with life and coping. Often the family will feel less isolated if they can participate with a specific disease support group.

With regard to neonatal problems, not all birth defects are genetic; however, most families benefit from an evaluation and genetic assessment when any birth defect is present, even if the condition is not genetic. (Parents always worry about recurrence for themselves and for other family members, and fears can quickly be resolved if this issue is addressed.) Such evaluations are well within the scope of pediatrics and certainly should be undertaken soon after birth if a problem is found in a child.

Medical and family history may be helpful in making a diagnosis or in differentiating an acquired problem from an inherited one. If a positive family history is present, it can be very helpful; however, the absence of a positive family history does not rule out a genetic etiology. Pregnancy history also is very relevant. For example, maternal insulin-dependent diabetes mellitus confers an elevated risk (about 6 percent) for major birth defects, including spina bifida and heart abnormalities.[7] Fifth disease (erythema infectiosum, caused by parvovirus B19) can cause fetal death and hydrops.[8] The timing of environmental exposures with embryonic/developmental phases can be helpful in assessing birth defects.

Physical diagnosis is an essential part of a genetic evaluation. As an aid to diagnosis, pediatricians should practice their descriptive skills in enumerating physical findings, especially descriptions of the face and head. Although there are specific terms for most morphologic findings, a crisp, clear description also will serve quite well (for example, "narrow eye slits" for blepharophimosis, "eyebrows that meet over the nose" for synophrys, etc.).

If at all possible, it is helpful to the parents to observe the physical examination. It can be informative for them to see what the clinician is describing. The clinician should avoid language that is inherently offensive during this process. Some of the older language for morphologic findings that falls into the offensive category includes: monster, antimongoloid, gargoyle, simian, hare, dwarf, cat cry, carp mouth, etc.

Some conditions have distinctive, albeit variable, findings, such as in Down syndrome (frequency about 1/800). Other conditions, like Turner syndrome (frequency about 1/3,000 girls) may be identified at birth by unusual edema of the hands and feet. Of course, not all girls with Turner syndrome have this finding. Growth charts and periodic developmental assessments are extremely helpful in detecting problems early. Common but superficial findings such as cafe-au-lait spots should not be ignored either; five or more spots on the trunk suggest neurofibromatosis, which is rare but still occurs at a frequency of about 1/2,500 persons. Clinicians need to include genetic conditions in the repertoire of diagnoses they consider with each infant and child.

Intervention and Treatment

Often the first question about intervention with a child who has a birth defect arises in the delivery room.

In general, this is not the time to debate diagnosis. It should be emphasized that children with severe cosmetic problems can be "normal," and normal-appearing infants may have significant problems.

A discussion of problems present in a child should be held with the family as early as time permits after basic stabilization has been achieved. The discussion need not be delayed for a final diagnosis. It is probably easiest to do this with the parents (rather that the extended family) and with the child present.

Parental hesitancy in assigning a name to a newborn child can signify a delay in bonding and potential rejection. It is beneficial for the physician to learn the infant's name from the family and use it when talking about the child with both parents together.

The outdated practice of sedating a mother who has had a child with a problem seems to have nothing to commend it and should not be encouraged.

Couples with a child with a serious birth defect will be challenged to the depths of their emotional resources, but avoidance and delay in discussion do not help. The physician should be truthful without being insensitive and supportive without being paternalistic. The medical emergency sometimes presented by a newborn child with a birth defect is generally managed quite well by traditional medical intervention, but the challenge of helping parents to understand and cope with their disbelief, distress, and disappointment is the difference between adequacy and excellence in patient care.

Conclusions

While genetic conditions, chromosome disorders, and serious birth defects cannot be cured, they can be treated and the effects lessened. Early identification, thoughtful and skillful intervention, and the use of community and state resources can do much to allow a child to realize his/her potential. The primary care physician, family practitioner, or pediatrician is the ideal person to provide this support and to orchestrate the outcome.

Assessing the Roles of Genes in Diseases of Adulthood

Reed E. Pyeritz MD, PhD

Dr. Pyeritz is Associate Professor of Medicine and Pediatrics, Director of Clinical Genetics, The Center for Medical Genetics, The Johns Hopkins University School of Medicine, Baltimore.

The cause of common diseases of adulthood is invariably a complex nexus that includes genetic factors. Genes are likely to be important when common diseases affect younger adults, especially those with a positive family history. A wide variety of disorders caused by mutations in single genes may not become evident until adulthood.

A recent book on the prospects and perils of medical genetics begins with:

> *Genetics does not matter much to the delivery of medical care. Its meager contribution, except in the detection and management of a few rare, serious diseases, is due not to the absence of genetic factors in many diseases but to an inability to identify them.* [1]

Unfortunately, this statement is indicative of the current attitude and practice of most physicians. But genetics *does* matter increasingly in medicine, and the main goal (indeed, responsibility) of medical geneticists must be to alter such misperceptions. With the possible exception of trauma, all human pathology has genetic influences in etiology and pathogenesis, and even in injury, the genome influences rapidity and soundness of healing. The two diametrically opposed positions that "genetic diseases" are rare versus that all disease is genetic need to be reconciled. On the one hand, medical genetics cannot be perceived as relevant only to pediatricians. On the other, physicians who care for adolescents and adults must not only understand the scientific basis for the relevance of genetics but also develop familiarity with the means of discovering and applying genetic information about their patients.

As the articles in this issue emphasize, both the basic science of human genetics and its application to clinical medicine have burgeoned in the past decade.[2] The next ten years will witness major strides in sequencing the entire human genome; mapping the majority of the 50,000 or so human genes,[3] understanding at the DNA level the cause of most of the conditions we now recognize as simply inherited (Mendelian) "genetic diseases,"[4] and considerable progress in gene therapy. Space does not permit even a superficial accounting of how these technical challenges will be accomplished, while satisfying the many and often competing demands of biomedical ethics, economics, law, public interest, and politics.[1,3,5-12] Because no current application of genetic technology is totally without controversy, the following discussion of

applications to adult medicine should be viewed with an eye to potential pitfalls and challenges.

Diagnosing Hereditary Disorders in Adults

A substantial number of disorders caused by a single mutant gene may not be correctly diagnosed or even detected until adulthood. Examples range from mild expressions of sickle cell disease and cystic fibrosis through those with insidious onset, such as the spinal muscular atrophies, to disorders with true late-onset, such as Huntington disease (Table). For timely diagnosis in such cases, there is no substitute for the astute clinician who will not discount vague yet recurrent symptoms; who will know enough to suspect a rare disorder; and who can detect early, subtle cardinal signs, search for pleiotropic manifestations, and perform confirmatory laboratory investigations.

A careful family history, if it uncovers relatives with similar problems, can be invaluable but is time-consuming and often frustrating to obtain in sufficient detail. Frequently adults with Mendelian disorders are diagnosed by specialists, who are evaluating only one of a syndrome of manifestations. Each branch of medicine now seems to have a corner reserved for "genetics." This not altogether laudable reductionistic trend has led to "psychiatric genetics," "neurogenetics," "endocrine genetics," and so forth. The risk is that any disorder not labeled "genetic" will have genetic factors in its pathogenesis ignored.

The consequences of overlooking the diagnosis of Mendelian disorders in adults can be profound to both the patient and the patient's family. Although many hereditary conditions lack curative or even palliative therapy, some conditions can be treated effectively if diagnosed promptly. The dilated ascending aorta in the Marfan syndrome can be replaced surgically before it dissects. Pharmalcologic doses of cofactors or nutritional modulation can ameliorate clinical problems in vitamin- or diet-responsive inborn errors of metabolism, such as homocystinuria. Environmental insults, such as cigarette smoke and high-cholesterol foods, can be avoided in patients with deficiency of alpha$_1$-antitrypsin and low-density lipoprotein receptors, respectively.

The benefits to relatives of timely diagnosis can be even more important. For example, patients with end-stage renal disease are cared for in much the same way regardless of the type of nephropathy. However, it is crucial to diagnose adult polycystic kidney disease, which is an autosomal dominant condition, so that the patient and the family can receive genetic counseling. Relatives with presymptomatic disease can be detected, treated, and counseled. Couples with one partner affected can be counseled about the availability of prenatal diagnosis by fetal ultrasonography or DNA markers. Failure to offer such counseling is well established by case law as malpractice.

The importance and conflicts of counseling for adult-onset conditions has been emphasized by developments in Huntington disease. Most people who carry the Huntington disease mutation have reproduced before symptoms or signs develop. Until recently, even if a person was known to be at 50 percent risk for having inherited the mutant gene from an affected parent, it was usually impossible to diagnose the person as affected before they had their own children. Mapping the Huntington locus to the end of the short arm of human chromosome 4 and developing DNA markers close to the locus (restriction fragment length polymorphisms) now permit in many families

Table. Representative Hereditary Disorders Potentially Not Evident until Adulthood

Disorder	Number Affected or At Risk in US
Adult polycystic kidney disease	500,000
LDL receptor defects	500,000
Familial Alzheimer disease	250,000(?)
Alpha$_1$-antitrypsin deficiency	120,000
Fragile-X syndrome	100,000
Neurofibromatosis	80,000
Sickle cell disease	65,000
Huntington disease	25,000
Marfan syndrome	25,000
Hemophilia	20,000
Myotonic muscular dystrophy	12,500
Becker muscular dystrophy	5,000
Apolipoprotein defects	?

Disorders and Carrier States Especially Prevalent in Some Ethnic Groups

Glucose-6-phosphate dehydrogenase (G6PD) deficiency
Heterozygosity (females) and hemizygosity (males) about 0.10 in American blacks; also common in some Mediterranean populations
Alpha thalassemias
"silent" carrier status (deletion of 1 of 4 alpha alleles) 0.20 to 0.25 in American blacks; also high in Melanesia, Mediterranean areas, Saudia Arabia, and Southeast Asia
"trait" status (deletion of 2 of 4 alpha alleles) 0.03 in American blacks
Beta thalassemias
0.01 in American blacks; 0.10 in some Mediterranean populations
Sickle cell heterozygotes
0.08 in American blacks; about 0.20 to 0.30 in sub-Saharan Africa; also high in some Mediterranean areas, the Middle East, and Southern India
Adult GM2 gangliosidosis (adult form of Tay-Sachs disease) frequency still being assessed, but not as high as the 0.04 frequency among Ashkenazi Jews of heterozygosity for classic Tay-Sachs disease
Cystic fibrosis
about 0.05 in Northern Europeans

Disorders for which Major Gene Effects are Strongly Suggested in Many Cases

Bipolar illness (manic-depressive disease)
Schizophrenia
Alcoholism

presymptomatic and even prenatal determination of carrier status.[3] As was anticipated by the few centers who began this service, presymptomatic diagnosis of a uniformly lethal condition is frought with psychologic, ethical, and social ramifications.[13,14] Not all people who are eligible for testing choose to undergo it. We can anticipate the same diverse reactions from people at risk for other adult-onset Mendelian diseases as more DNA probes are developed. Nonetheless, the obligation for the physician will remain *to offer the service* when a person is known to be at risk.

The demarcation between Mendelian disorders and those due to gross abnormalities of chromsomes is increasingly blurred. In some disorders previously thought to be due to mutation of a single gene, high-resolution microscopic analysis of chromosomes has revealed subtle deletions of specific regions. For even miniscule deletions to be visible, considerable DNA is missing, enough to encode numerous genes. Loss of multiple functions is presumed to account for the complexity of some of the phenotypes, such as the Prader-Willi syndrome. While the small deletion of chromosome 15 in this particular condition is rarely (if ever) passed on in a family from the patient (who is usually infertile), small deletions of other contiguous genes are compatible with transmission if the clinical manifestations permit survival to adulthood. The Wilms tumor-aniridia syndrome, due to a small deletion of chromosome 11, is an example.

Thus, not all disorders due to chromosome anomalies are hereditary in the sense that they can be passed on in families. Klinefelter syndrome (a male with an extra X chromosome) and Turner syndrome (a female lacking one of two X chromosomes) may not be detected until adulthood, not infrequently as part of an infertility evaluation. The fragile-X syndrome is, after the Down syndrome, the most common cause of mental retardation in males and often has little to show in outward phenotype. And even though an alteration of the end of the long arm of the X chromosome usually is evident, some aspects of inheritance suggest that one or a few loci are defective at the fragile site. The condition is inherited as an X-linked trait, although with several important and intriguing nuances. Some men and the majority of women who carry the abnormal locus at the end of the long arm of the X chromosome may not even be detected as intellectually impaired.[15] This is an example of one condition in which it is vitally important to diagnose the cause of mental retardation in all children and adults because of the implications to other relatives, who may unknowingly perpetuate the condition in their offspring. Full workup may involve evaluating institutionalized relatives who have been out of the family mainstream for years.

About two in a thousand adults have a chromosome aberration called a balanced translocation; no important genetic information is evidently lost, but two entire chromosomes may be attached to each other or parts of two chromosomes may be interchanged. Carriers of translocations are at risk for parenting offspring with an unbalanced chromosome constitution. Adult carriers usually are detected only after the birth of a child affected with a complex phenotype, often including retardation and multiple anomalies. When a parent is shown to be a carrier of a balanced translocation, all of his or her immediate relatives should be offered karyotype screening. Occasionally, the best-intended attempts by the parent and the physician to contact, counsel, and screen relatives are frustrated by denial, logistics, or problems with confidentiality.

Emerging Role of Genetic Factors in Common Diseases

It is fair to say that a field of study has acquired permanence when a multiauthored textbook appears. Such is imminent on this topic,[16] an area in which major advances have been made in the past few years. Much of the new knowledge has been acquired through a reductionistic approach: how much of coronary atheroscleosis is due to identifiable single-gene mutations, such as defects of the LDL-receptor [17] and apolipoprotein B-100.[18] This approach, while instructive in pathophysiology, is not likely to uncover all genetic predispositions, most of which are subtle, additive, and interactive.[19] But well-documented single-gene mutations do predispose to some cases of many common disorders such as diabetes, hypertension, peptic ulcer, and Alzheimer disease. Less well established are single-gene predispositions to other common disorders such as bipolar illness and schizophrenia.

Increasingly, the tools of molecular biology can be brought to bear on determining which patients, and which of their relatives, possess one of the recognized single-gene predispositions.[20] The first step, however, is narrowing the scope of the inquiry; that is, short of screening every patient with coronary artery disease with every gene probe relevant to lipid metabolism, how does one optimize the diagnostic process? Once again, the importance of the family history is emphasized. A positive family history for coronary artery disease has long been recognized as one of the half-dozen major risk factors. The younger a patient's relatives were when they developed or showed signs of coronary occlusion, the more powerful the family history as a predictor of risk. Similarly, the younger the patient with one of the adult-onset common diseases, the more likely the importance of genes in cause. This is especially true if environmental and other risk factors are lacking. Thus, the 41-year-old nonhypertensive, nondiabetic woman with her first myocardial infarction, who has not smoked or taken birth control pills, is a prime candidate for all that medical genetics can bring to bear on this complex disorder.

This short view of the growing importance of genetics in adult medicine can only hope to arouse curiosity and concern on the part of health professionals. The science of human genetics is indeed un-

dergoing a revolution, and the curiosity about human variation and pathophysiology that led many of us to medicine, and sustains some of us in investigation, will receive increasing satisfaction in years to come. However, there is a price to be paid for our intelectual contentment: we must apply this new knowledge and technology effectively, promptly, and consistently.

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

MARYLAND DIAGNOSTIC IMAGING CENTER

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

Genetic Counseling and Patient Education

Barbara A. Bernhardt MS

The author is Genetic Counselor, Sinai Hospital of Baltimore.

Genetic counseling, a process that begins with the identification, usually by the primary care provider, of at-risk individuals or families, is a medical service aimed at educating the family about all aspects of a genetic disorder, outlining options open to the family, and promoting autonomous decision making.

Genetic counselors regard certain principles as sacrosanct. These principles were outlined in 1973 when the Maryland General Assembly established the Maryland Commission on Hereditary Disorders. The law states that genetic services recipients should be offered counseling services that "(i) are nondirective; (ii) emphasize informing the individual; and (iii) do not require restriction of childbearing."[1] Because genetic counseling evolved from roots in the eugenic movement, these guidelines needed to be stated outright.

When the first American genetic counseling center, the Eugenics Record Office, was founded in 1915, genetic counseling activity was aimed at improving the gene pool by limiting reproduction by those deemed unfit.[2] More recently, advances in the science of genetics and increased understanding of human genetics have been accompanied by the development of safe reproductive options for at-risk couples and improved treatment of genetically affected individuals. These developments, among others, have resulted in a gradual change in the nature of genetic counseling. It has evolved into an educational, supportive, and nondirective process widely accepted by health care providers, the federal and state governments, and the public.[3]

In 1974, the American Society of Human Genetics provided a new definition of genetic counseling that addressed both medical and psychosocial aspects of counseling:

> Genetic counseling is a communication process which deals with the human problems associated with the occurrence, or risk of occurrence, of a genetic disorder in a family. This process involves an attempt of one or more appropriately trained persons to help the individual or the family to (1) comprehend the medical facts, including the diagnosis, the probable course of the disorder and the available management; (2) appreciate the way heredity contributes to the disorder and the risk of recurrence in specified relatives; (3) understand the options for dealing with the risk of recurrence; (4) choose the course of action which seems appropriate to them in view of their risk and their family goals and act in accordance with that decision; and (5) make the best possible adjustment to the disorder in an affected family member and/or to the risk of recurrence of that disorder. [4]

This definition spells out important aspects of genetic counsel-

ing. It first points out that genetic counseling often is provided by a team of professionals. It emphasizes the educational aspects of counseling and then highlights the role of genetic counseling in reproductive planning and the goal of independent decision making. Finally, the psychotherapeutic role of genetic counseling is stated. Because diverse individuals, many of whom are not trained in psycho-therapy, provide genetic counseling, this final goal has been the most controversial.[5] Despite the controversy, most counselors recognize that the educational value of genetic counseling is maximized only after the psychological impact of genetic disease on the family is considered. [6]

Who Participates In Genetic Counseling?

Individuals who could benefit from genetic counseling are generally those who express concern or have unanswered questions about genetic conditions and birth defects. They may be seeking additional information about the diagnosis, treatment, or natural history of a genetic disorder affecting them or a family member. They may want help in deciding whether to have prenatal or presymptomatic testing. They ask "what is this," "why did it happen," "will it happen again," "can it happen to me," and "what can I do to keep it from happening." The primary care physician is often in a position to answer these questions, and if he or she has adequate time, current information, and a good understanding of the conditions of concern, the patient's own physician can and often does provide genetic counseling.

Although the primary care provider, by virtue of an ongoing relationship with the patient, is well suited to provide counseling, few have formal training in genetics and many lack time to provide in-depth counseling. Because genetic conditions are generally individually uncommon and rapid advances in their diagnosis and treatment are taking place, many patients may be better served if preliminary and follow-up genetic counseling are provided by the primary care provider and definitive counseling is provided by a medical genetics team.

Most clinical genetics services, including genetic counseling, are provided by a multidisciplinary team. The team generally includes individuals with expertise in the diagnosis and management of genetic conditions as well as in information presentation and family support. Genetic laboratory services are often available on-site, as are other specialty consultants who may be called for assistance in patient diagnosis and disease management. In most clinical genetics centers, the core providers of genetic counseling are clinical geneticists (physicians with subspecialty training in clinical genetics) and genetic counselors (professionals with graduate-degree level training in genetic counseling). Many multidisciplinary teams also include social workers and nurses who provide psychosocial support, crisis intervention, family follow-up, and referral to community resources. The American Board of Medical Genetics provides certification for several categories of genetics professionals, including genetic counselors and clinical geneticists.

The Genetic Counseling Process

What takes place during a genetic counseling encounter will vary with the provider, with the concerns of the family seeking counseling, and with the indication for referral. The first goal of genetic counseling, as reflected in the definition cited earlier, is patient education. To maximize the educational value of genetic counseling, certain information about the patient and the family must be elicited. This information, including family and social history, is easily gathered in the initial stages of the counseling session and, in addition to the intrinsic value of the responses, the exchange serves to establish rapport with the family.

Early in the counseling session it is important to determine the patient's expectations of counseling. The counselor usually has an agenda for the session and knows what he or she wants to accomplish. However, unless the counselor's expectations mesh with those of the counselee, the counseling will not meet the needs of the patient, may not answer his/her questions, and may increase patient anxiety. Since patient education should be based on prior knowledge and misconceptions, it is important at the outset to determine the patient's level of knowledge about the genetic condition as well as any misinformation the client has.

Education about the facts of the genetic condition present or suspected in the family depends on an accurate diagnosis. An explanation of this diagnosis, how it is reached, and its reliability is a part of the counseling. Management of the conditions is generally discussed, as well as where treatment can be obtained and which health professionals should participate in the care of those affected or at risk. With the strong emphasis on education, one aim of genetic counseling is to help the patient and family become experts in their diagnosis and knowledgeable health-care consumers.

The natural history of the condition and the variability of clinical manifestations also are reviewed. These two points, along with the perceived magnitude of the recurrence risk, weigh heavily on reproductive planning. While patients generally ask about natural history, they often do not think to ask about disease variability and may gauge severity only on their own family's experience. Therefore, in counseling the patient, it becomes very important to review the range of variability of the condition, especially when the proband or other affected family members have an unusually mild or severe course.

Discussion of etiology often entails review of the genetic basis of the conditions and leads easily into enumeration of recurrence risk. When defining recurrence risk, fractions and percentages for the conditions occurring and *not* occurring should be given. An assessment of the counselee's perception of the magnitude of the risk is also appropriate.

Finally, reproductive options are introduced. The options open to a particular counselee will vary, depending on the condition for which they are at risk. In general, all possible options should be introduced, even if the counselor believes that they might be negatively received by the patient. For example, when counseling a couple in which the male partner has an autosomal dominant disorder such as neurofibromatosis, artificial insemination by donor (AID) will reduce the risk for the condition to that of the spontaneous mutation rate in the general population. If the counselor does not offer this option because it is perceived that the patient will be offended, the couple who wants to minimize their risks will not be given the opportunity to do so and may not themselves ask about AID. Genetic counseling patients often have read about various forms of prenatal testing such as amniocentesis and ultrasound, and it may be helpful for the counselor to explain why, in some situations, such alternatives might be inappropriate.

After the counseling session or sessions are completed, ongoing support and follow-up care are needed and should be available. Most genetic counselors send a written summary to the patient and to the referring or family physician. Counseling can be reviewed and reinforced by the primary care provider. Ongoing support for the family often is provided through association with a voluntary genetic disease organization, by genetics center staff, and by the primary care provider. Family needs will vary with time, but certain stressful times can be anticipated, and guidance and planning for such times can be offered to families.

Nondirective Counseling and Decision Making

Genetic counselors often report that patients are unable to make reproductive decisions during the counseling session and that more time must elapse, or additional counseling must be offered, before a decision is made. Such experience reflects the truly difficult decisions many couples need to make. In addition, these decisions are being made at a time when new, confusing, and emotionally charged information is presented. Nondirective skilled genetic counseling will help patients arrive at independent decisions, even if a great deal of time must be devoted to the process. A genetic counseling experience generally differs from other medical care encounters in which patients normally want and expect to be told what to do. The issues discussed in genetic counseling such as whether to have children, prenatal diagnosis, or presymptomatic testing for Huntington disease are intensely personal and have far-reaching ramifications. Most courses of action open to couples are associated with risks and benefits that must be individually weighed. Generally one option gradually emerges as most acceptable for each couple depending on their values, goals, and assessment of risks; the decided course of action often is not the one the genetic counselor would choose. When a couple asks the counselor "What do you think I should do?" they often are asking for help in deciding and for approval of their decided course rather than for a decision itself. Letting the patient know the range of options open and some reasons why other couples have chosen each course will legitimize any option they may choose and begin to provide some guidance for making decisions.

Barriers To Effective Genetic Counseling

Once the patient has access to appropriate genetic counseling services, barriers to meeting counseling goals may still exist. Some of these barriers, such as the public's poor understanding of genetic principles and probability, can be dealt with by avoiding technical jargon, by not overloading the patient with new information and by providing easily understood explanations after determining the counselee's level of knowledge.

Other barriers often exist and can be overcome if recognized. Ill-timed genetic counseling can be valueless or worse, harmful. For example, immediately after a genetic condition is diagnosed or just following the birth of a child with a congenital anomaly, a complex explanation about cause of the condition without considering the patient's readiness for the information may serve to alienate the patient from a potentially helpful resource. Genetic counseling at such times should be aimed at first helping the counselees resolve and understand their feelings and letting them know that genetic information is available for them when they are ready for it. The counselor should plan on multiple counseling sessions in such instances.

Cultural barriers to genetic counseling often exist and can be difficult to overcome. Attitudes toward issues commonly discussed in a genetic counseling session, such as childbearing, reproductive technology, loss of fertility, chronic disease, and disability, are greatly influenced by culture, religion, and ethnicity. Discussion of such barriers to counseling is beyond the scope of this article, but recognition of such biases on the part of both counselor and counselee is necessary before there can be hope of overcoming such differences.

Using the wrong words when counseling can be detrimental. Referring to a gene for Marfan syndrome as "defective" often is interpreted by the patient as a comment on their worth. Similarly, when counseling a deaf couple, discussing the "risk for having an affected child" may make no sense to the couple who do not consider themselves "affected" and who may be worried about their chance for having a hearing child.

Evaluating Genetic Counseling

Measuring the success of genetic counseling, either on the program level or on an individual patient basis is difficult because of the multiple aims of counseling and the lack of measurable criteria for success. Generally, the effectiveness of genetic counseling has

been measured in three different ways. Many studies have scored reproductive patterns after counseling with the expectation that a high risk of occurrence of a serious genetic condition would be correlated with no further reproduction. Other studies focused on how well the counselee understood and retained the facts discussed as assessed by a written test or verbal interview after counseling. The third measure has been client satisfaction or measuring how helpful and valuable the counseling was.

The first type of study supposes that at-risk individuals base reproductive decisions on the size of their risk and ignores individual autonomy and other factors important in family planning. The second type of study highlights the goal of patient education but ignores factors influencing acquisition or retention of genetic knowledge. The third type of study addresses how well the counseling meets the patient's needs, but measures for assessing satisfaction are crude at best.

The most comprehensive study of the effectiveness of genetic counseling was a prospective multicenter study examining the discrepancy in expectations and assessment of genetic services by 205 providers and over 1,000 genetic counseling recipients. [7] This study provided much-needed data and raised interesting questions about the nature and aims of genetic counseling. The investigators found that genetic counseling patients brought to the counseling session a huge array of topics they wanted to discuss. One of the major and disturbing conclusions of the study was that although most of the medical concerns of patients were discussed during counseling, most of the social concerns were not. Only 16 percent of the sociomedical concerns (such as school programs, financial costs, and relationship with spouse) that patients wanted to discuss were covered. More time devoted to counseling resulted in a greater number of patient concerns being discussed.

In terms of factual information learned during counseling, 53 percent of patients who were given a risk did not remember it, and 40 percent of patients who were given a diagnosis did not remember its name after counseling. Only 44 percent of the counseling patients reported that the counseling they received influenced their reproductive plans. However, over 78 percent of the study patients were satisfied with the counseling they received.

These data point up the complex and varied needs of genetic counseling families and the tremendous burden placed on the genetic counselor who is supposed to address those needs. The genetic counselor must tailor each counseling session to the needs of the individual counselee. This is problematic when time is short and there is a large body of factual information the counselor believes must be discussed. The answer to meeting client needs seems to be to first determine the goals of the patient and his/her level of knowledge and then allot enough time to meet those goals and to educate the patient. However, even in a straightforward situation involving prenatal diagnosis counseling, an average of three hours of provider time is needed.[8] Whether providers can set aside enough service time and whether patients can pay for that time remains unsettled.

Conclusions

The scope of and indications for genetic counseling will change in years to come. As more reproductive options become available for would-be parents, counseling needs will increase because couples will consider taking advantage of them. Some prenatal screening tests, such as maternal serum AFP testing, are becoming routine, and follow-up counseling will always be a component of this type of screening. A great increase in the need or genetic counseling will emerge as more DNA-based genetic tests become available for presymptomatic and prenatal diagnosis. [9] Although the number of trained professionals providing counseling continues to grow, the number of vacancies in programs is anticipated to increase, [10] making it likely that some of the burden of providing counseling services will fall increasingly on the primary care provider. More professional and public education in genetics will be needed, [11] and ensuring accessibility to genetics services in the future must be addressed.

Who Is the Patient? A Moral Problem

Robert Wachbroit PhD

The author is a Research Scholar, Institute for Philosophy and Public Policy, University of Maryland, College Park, and Assistant Research Scientist, Center for Public Issues in Biotechnology, The Maryland Biotechnology Institute, University of Maryland, Catonsville.

As more and more diseases come to be seen as neither personal injuries nor potential epidemics, the problem of who is the patient will become a central ethical concern for physicians.

New genetic discoveries and technologies in medicine have raised a number of profound ethical questions. While many of these questions touch only a few disciplines, for example, the medical researcher, the genetics specialist, the health policy professional,[1] some of these questions have a much broader reach, touching less-specialized areas of medical practice. Developments in genetics will significantly affect our understanding of confidentiality and prenatal diagnosis. Less directly, though no less significantly, these discoveries and technologies also will affect how we see ourselves, what we think it is to be human or to be normal, etc. Some complex problems surround the first of these topics, confidentiality. My discussion will be from the standpoint of ethics rather than law or sociology [2] and from the perspective of the physician rather than that of the patient or of the government.

As we learn more and more about the genetic basis of many diseases, questions such as, "To whom does the physician owe a duty of confidentiality?" are becoming increasingly difficult to answer. Part of this difficulty can be traced to a transformation in our understanding of who is the patient and a corresponding change in our understanding of the physician-patient relationship.

Let me illustrate this transformation with an example.[3]

> A young boy has been diagnosed as having Duchenne muscular dystrophy. Since this is an x-linked, recessive disease, there is good reason to believe that the boy inherited the defective gene from his mother who in turn inherited it from her mother. (Because it is a recessive disease, these women are under no risk of contracting any symptoms or suffering the disease themselves even though they carry the harmful gene.)
>
> The physician learns that the boy's mother has two sisters. Given the available information, each of these sisters has a 50 percent probability of being a carrier of the harmful gene.
>
> The physician wishes to inform these sisters of their condition, since it might affect their reproductive plans, but the boy's mother forbids it. There was a terrible falling-out between the sisters. The boy's mother now sees withholding the information as a way of getting revenge on her sisters. She therefore insists that the boy's right to confidentiality be respected.

Admitterdly, aticulating the ethical question raised by this sort of case as, "Who is the patient?" is not the usual approach. A more common one would be to frame the ethical question in terms of what the limits and duties of confidentiality of the physician are with respect to the patient.[3] Thus, if the medical condition may (or must) be disclosed to others, this is because of limits to the duty of confidentiality that arise from other considerations that outweigh the duties the physician has towards his/her patient.

By presenting the issue in terms of who is the patient, I am trying to underscore a shift in how such cases should and will be seen. If the physician must disclose the information to others, this does not reflect a duty or consideration that competes with the integrity of the physician-patient relationship. Rather, it reflects that very relationship. Disclosures in these cases are not "news leaks." If and when they are justified, they arise from the physician's loyalties and obligations as a *physician* to the patient. The physician's disclosure, if it is to have this kind of justification, must be to the patient. The crucial question, however, is who is the patient.

By analyzing the above example, we can get a better understanding of how this question will become increasingly significant. We will examine three different models of health care that might be invoked to frame the ethical dilemma raised.

Models of Health Care

The most familiar model is what we could call the *private health model.* Its clearest applications are to cases of physical injury or noncommunicable diseases. In such cases, the question of who is the patient has an obvious answer: the patient is the particular individual suffering the disease. According to this model, the physician's mission is to care for his or her patient and to treat the disease. This mission, however, is constrained by a respect for the autonomy of the patient, which generally means that the physician must have the patient's informed consent before performing any major medical intervention. Furthermore, the physician owes a duty of confidentiality to the patient.

In this model there are two arguments for the physician's duty of confidentiality.[4] One argument looks at the consequences of having this duty. By having this duty, we encourage the patient to provide the physician with any information that might help in providing medical care, regardless of how embarrassing or awkward the information might be thought to be. Without this duty, people might withhold information or they might not even seek medical care because they might fear that their interests would be jeopardized. The other argument looks at the rights of the patient, in particular the right to privacy. Insofar as the patient has a right to privacy, the physician has a corresponding obligation to respect that right, which is expressed in a duty of confidentiality.

Of course, the duty of confidentiality on the private health model is not absolute. The most notable exception is when disclosure would prevent the occurrence of serious harm. That exception, however, does not arise in this case. Disclosing the genetic information would at most succeed in preventing the birth of possible harmed individuals, but that is quite different from preventing any actual harm. (If this isn't clear, imagine the case where the aunts are informed, but they decide nevertheless to have children. Given that the children, including any who are born with Duchenne muscular dystrophy, might not otherwise have been born, can we say that any of them have been harmed?) Thus, we should conclude that, however much the physician dislikes it, he/she is ethically obligated to keep the information confidential. Since the two sisters are not the physician's patients and there is no question of avoiding serious harm, he has no special duty toward them.

One might think the problem could be avoided if it were anticipated. The physician simply announces in advance that his/her duties of confidentiality have several exceptions. Among those exceptions are cases where the physician believes that disclosing medical information to relatives could result in a direct benefit to them. Thus the patient is told that access to health care services is contingent on consenting to these exceptions.

There are a number of problems with this approach. First, what is the moral justification for this modification? Can this modification be reconciled with the arguments for confidentiality identified in the private health model? Or does this modification represent a new exception to that duty, in which case it would need to be justified? Second, suppose the patient does agree with this restriction. Is the physician obligated to inform relatives in cases such as the one above? If he/she is obligated, is it because he/she is a *physician* or would anyone who learned the relevant information have an obligation to inform the relatives? Finally, what happens if the patient refuses to consent to these restrictions? If the physician refers the patient to some other physician who doesn't place such restrictions, the potential problem is simply passed to someone else. From the standpoint of the medical community, the potential problem remains. If the physician does not refer the patient to anyone else, does this mean that the patient is to be abandoned? This hardly seems to be a satisfactory result since the point of placing these restrictions was to ensure that the physician is not forced to ignore the health concerns of the patient's relatives.

A different approach to the problem of disclosure is the *public health model.* Its clearest application is to cases of highly contagious diseases. In such cases, the patient is the public, and the physician's mission is to promote the public's health. Concepts such as autonomy or informed consent are to be understood in terms of the political will and decision-making process of the public. There is, however, no duty of confidentiality in this model since it plainly does not make sense to talk about such things with respect to the public.

Because the public's will doesn't always reflect a consensus, the mission of the public health model may, at times, be in conflict with a respect for the autonomy and choices of some individuals. As the case of quarantine or mandatory vaccinations illustrates, public health measures may require restricting some people's liberty or ignoring some people's choices. While these conflicts point to regrettable costs in this model, they do not signify any constraints. The justification for this attitude lies in the sheer magnitude of the serious harm that would be avoided. The public's health cannot be sacrificed for the sake of the rights of some individuals. Because of this decisive normative feature in the public health model, identifying anything as a public health problem is a significant matter. Some of the darker moments in our history arose from incorrectly characterizing some problems as public health problems.[5] In many cases, state sterilization laws enacted in the early part of this century were based on the view that "feeblemindedness" was a public health problem. Unchecked, it would undermine the quality of the race. In a famous Supreme Court decision, Justice Oliver Wendell Holmes said, "This principle that sustains compulsory vaccination is broad enough to cover cutting the Fallopian tubes. ... Three generations of imbeciles are enough." [6]

How we use the public health model to read the above case depends on what we identify as the public health problem. Suppose that Duchenne muscular dystrophy is taken to be a public health problem. Then, according to this model, the physician has no duty of confidentiality in this matter; instead he has a duty to inform not only the sisters of their possible medical condition but also anyone else who is responsible for controlling the spread of this disease.

While both the private health and public health models have some legitimacy, neither perfectly fits the facts of this example. The private health model is not entirely appropriate because we are dealing with a *transmissible disease*. We should not see the disease as confined to isolated individuals, for how we treat the disease in one individual will affect the likelihood of its appearing in another individual. But neither is the public health model entirely appropriate because we are dealing with a *noncontagious* disease. The general public is not at any special risk because some individuals have this disease. Indeed, as we noted, no actual people are at risk; only the possible offspring of these women may be at risk. If we regard untreatable genetic diseases, such as Duchenne muscular dystrophy, as public health problems, then we are in effect regarding the birth of certain kinds of individuals as public health problems, a view that is as ominous as it sounds.

Finally, let us consider what we could call the *family health model*. As the name suggests, the physician's patient is the entire family, where "family" is understood to refer to a genetic network rather than a social institution. The physician's duties are to the family as a whole. While his respect for the family's privacy obligates him to refrain from disclosing any information to unrelated third parties, this obligation does not extend to the family itself. The family's privacy is plainly not violated by disclosing information to other family members.

The family health model seems to acknowledge that genetic diseases are often family diseases, and so it seems to be tailored to fit some of the ethical problems arising from genetic diseases. It also seems to fit the current practice of some physicians since members of a family typically see the same physician. Nevertheless, there are two problems with this model. First, if the family is the patient, the physician would seem to be ethically obligated to ensure that all the adult members are informed of the medical situation. Many families are scattered, with some members completely out of touch with others. Without a radical change in the profession, the physician does not have the resources to track down distant family members.[7] Second, many families are divided. Who, then, speaks for the family? Who decides whether some piece of information should be kept confidential? Rather than clarifying the ethical issues, the family health model may simply shift them.

I don't wish to suggest that the options I have surveyed are the only options or that the problems I have raised with them are irresolvable. We have only begun to reflect on these matters. While the kind of case we have been examining may now be infrequent, that will soon change. As we learn more and more about the genetic basis for various diseases, this kind of case will become increasingly familiar. A diagnosis not only will identify a disease, but it may thereby indicate the medical condition of other individuals. Thus physicians from a wide range of specialties increasingly will find themselves confronting situations where it is not clear who the patient is and, consequently, what their responsibilities and obligations are.

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

ARMY MEDICINE. BE ALL YOU CAN BE.

Why Was My Insulin Changed?

Doctor, I do not know whether I am taking the insulin that is best for me. My regular physician was on vacation and the physician's assistant in the office decided that I should be placed on insulin because my blood glucose was out of control. The PA gave me a note to get NPH-U100 insulin from the pharmacy and to take it to the Diabetes Educator at the hospital for instruction on its administration. The pharmacy dispensed NPH-U100 (Beef-Pork). The Diabetes Educator thought that all patients receiving insulin for the first time should receive either synthetic or semisynthetic insulin (Novolin N-U100,® Insulatard Human U100,® or Humulin U100®). When the physician's office was called for clarification, the PA referred the call to another physician taking calls that day (a gastroenterologist) who never had heard of synthetic and semisynthetic insulin. When the situation was explained he approved the use of the newer insulin. But I am confused. Why was my insulin changed?

For several years, it has been the policy of all diabetic clinics and physicians specializing in diabetic care to do the following:

1. If a patient has been doing well on any insulin, do not transfer to another insulin.
2. If a patient is taking insulin for the first time, synthetic or semisynthetic insulin should be used. These insulins are less likely to cause allergic reactions or to result in antibody blockage of the insulin effect over time.

The Diabetic Educator was correct in calling for clarification of the insulin order and placing you on the synthetic human insulin (Humulin N-U-100®) you are now taking. The PA's note to the pharmacy was incomplete in that it did not specify the insulin source. The pharmacy had the option of giving you any of the following:

NPH-U100® Pork
NPH-U100® Beef
NPH-U100® Beef-Pork
Humulin N-U100®
Insulatard Human U100®
Novolin N-U100®

A word of caution to physicians: when one is exchanging calls with another physician, if at all possible reciprocate with one in the same area of practice or at least with the ability to care for the other's patients. The gastroenterologist readily recognized his limitations and accepted the recommendation of the Diabetes Educator. One further word of caution, a PA should not attempt to care for patients when his/her physician employer is away.

The patient is to be assured that she is taking one of the proper insulins for her diabetes.

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. And, choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package that is physician tested and approved. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500 form billing and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management

- ❒ menu driven
- ❒ on-line help manual
- ❒ maintains patient information
- ❒ insurance billing (1500 form)
- ❒ walk-out superbill
- ❒ end of month bill
- ❒ statistical reports
- ❒ accounting reports
- ❒ unlimited technical support
- ❒ unlimited software upgrades
- ❒ unlimited office staff training
- ❒ automatic back-up and restore
- ❒ separate ICD-9 and CPT code databases
- ❒ multiple diagnosis and procedure transactions
- ❒ password protection to sensitive areas
- ❒ no annual fee for Med Chi members

Immunotherapy of Disseminated Renal Cell Carinoma

Currently, surgical excision of the kidney harboring cancer is the only effective therapeutic modality of localized renal cell carcinoma. There is no effective systemic therapy for disseminated renal cell carcinoma. Since almost all patients with this disease die of metastases, the need for effective systemic biologic response modifiers (BRM) is hoped to be a new road to an effective systemic therapy. Among the BRM, Interleukin-2 (IL-2) has attracted the attention of many investigators in this field.

Natural Interleukin-2 is a lymphokine that is produced and secreted by T-lymphocytes. This glycoprotein molecule is intimately involved in the induction of a number of immune responses in which T-cells play a role.

Recombinant DNA technology has facilitated the large-scale production of these peptide and protein molecules in both microorganisms and eukaryotic cell expression systems. Thus, the availability of large quantities of recombinant human Interleukin-2 will allow the clinician to begin to explore its biologic activities and potential therapeutic use in patients with certain cancers. A preliminary report from the National Cancer Institute indicated some encouraging results in patients with renal cell carcinoma. We designed a Phase II open-labeled study. This study was designed to evaluate the toxicity and efficacy of a new rIL-2 in disseminated renal cell carcinoma. Following surgical resection of the primary tumor, 1 x 106 units/day rIL-2 was administered by 2-hour intravenous infusions daily for 4 consecutive days. At the conclusion of four cycles of therapy, the patients were re-evaluated for response. Those patients with complete and partial responses will continue on low dose 1.5 x 106 units/m2/day as outpatients. The toxicities were chills and fever (in all patients), transient hypotension in three patients, malaise and fatigue in most of the patients.

A total of 17 patients have entered this phase II open-labeled study. The follow-up ranges are from 6 to 24 months with a mean of 11 months. Four of the 17 had responses (24 percent). This includes one durable response (6 percent) and 3 partial responses (18 percent). The complete response has been durable in the lungs (20 months). The partial responses have been in the retroperitoneal site and have been of short duration. The toxicities of this high-dose rIL-2 have been hypotension, pyrexia, malaise, and skin rashes. We believe that the optimal conditions for the maximal efficacy and minimal toxicities include removal of the primary tumor, minimal tumor burden, lung metastases, 2-hour infusion delivery and intensive fluid therapy. There is only one complete durable response. The partial responses were not durable.

We concluded that the responses have been few and of short duration. Therefore, we need to combine this therapy with other modalities. Obviously there is no effective systemic therapy available; thus the search for such therapy should continue at an accelerated rate.

Will the Real Heart Attack Risk Factor Please Stand Up?

Ignoring chest pain prevents pre-heart attack treatment that can save life.

Early signs of an impending heart attack are usually not recognized in a crowd and they go unnoticed and undetected. Heart attacks remain the number one killer of the adult population because most Americans enter the hospital system when they are "crashing" with either heart damage or heart arrest . . . too bad.

Chest Pain Emergency Center at St. Agnes Hospital

Heart attacks have beginnings which are often ignored. Denial and delay take place because the symptoms are minimal and the pace of life seems too important to take the time to check them out . . . too bad; for it is here that the heart muscle is still viable and healthy.

Recognition and response can take place only if the individual or first responder (Early Cardiac Care Giver) pays more attention to these early warning signs and acts to check them out. . . . Be safe rather than sorry.

Since January of this year the Library's Technical Services Department has been using the "Card Datalog" computer software to catalog new acquisitions. Ultimately, records for the entire book collection will be entered into the computer, and the card catalog will be removed. However, the conversion of approximately 30,000 books will take some time. During this initial period, please remember that the card catalog may not reflect all our holdings. If you have any questions or difficulty in finding an item please ask one of the librarians for assistance.

The History of Medicine Collection
is attempting to build our
medical artifact collection.
Currently we are seeking
hand-held surgical instruments, pre-1920
that were used by member Maryland physicians.

Among materials being sorted in the History of Medicine Collection was the following letter from Major Rastus Ransom Norris of Crisfield.

Many Maryland doctors served overseas during the First World War, and many of their experiences are similar to that described here by Major Norris. Unfortunately the History of Medicine Collection contains very few personal narratives of Med Chi members who served overseas during World War I.

If you (or someone you know) has a collection or group of letters from Med Chi members stationed in AEF Hospitals, the Ambulance Corps, or any other health service during WWI and would be interested in donating or providing copies, please contact the History of Medicine Collection.

Admitting Room - Eighth Evacuation Hospital, Camp Meade. Arthur Shipley Papers.

Motor Field Hospital #36
Sanitary Train, 7th Div.
American Expeditionary Force
Dec. 29, 1918

Dr. Gordon T. Atkinson
Crisfield, Maryland

My Dear Doctor:

I have received your letter of November 12th and I appreciate your kind expression in regard to the part which I have taken in this conflict. You ask for an account of my part. . . I will take up the part that Field Hospital No. 36 took after it started for the front.

Field Hospital No. 36 took its position in the Zone of Advance on October 10th, 1918. . . . Our Divisional triage through which all cases were sent from the front was situated at Martincourt. At the triage all cases were sorted, the slightly wounded and non-transportable being evacuated to Field Hospital No. 36.

The personnel of our hospital in action consisted of 5 Medical Officers and 77 enlisted men of the Medical Department, one Dentist and assistant. Cases were brought from the ambulance to the Office and Admitting Room where there was always a Medical Officer, a Noncommissioned Officer and Clerk on duty. Here the data was taken and a clinical card begun making note besides the usual information required of the time of the injury, type of missile and time of arrival at [the] Hospital. The cases were divided into three types; the acutely shocked, moderately shocked, and slightly wounded. . . . you may be interested in the treatment of shock in the advanced front. It consists of the application of warmth externally by means of hot water bottles and hot blankets, hot drinks, and free exhibition[sic] of morphine and the introduction of Gum Salt solution into the vein which takes the place of the lost blood.

There were two operating teams, one of which I had charge of. A day or two before the Armistice we were compelled from the rush of work to work from three o'clock in the afternoon until about six the next day working continuously through the night operating. Word was sent to Headquarters for relief and two Medical Officers were sent which then kept three teams at work.

Nearly every other day large high explosive shells came over our Hospital and bursting in the road beyond. We were well protected being on the side of a hill and the Huns some distance behind us about 4 1/2 miles, and their gun fire came over our heads. The only part that made one nervous was the continuous buzz of the Hun planes over us not knowing when he would drop a bomb. I have the most profound respect for our doughboys, the life has been the hardest and the work the toughest. They were always smiling when brought into our hospital, shot to pieces with horrible wounds. They were always smiling and never complaining.

Now that the hostilities have ceased we as usual await orders. At first we were going forward to Germany; at present we do not know where we will go but expect to go forward; though we are all hoping and wishing now to head home. We feel we have done our part, small though it may be, but however as peace is about dawned we are ready to return to our old ways of living.

I have been shocked by receiving news from home of the great number of deaths from the "flu" in Crisfield and the states. [A particularly virulent strain of flu had swept the country by 1917 Dr. Atkinson, probably commented on the progress of the virus in an earlier letter.] *I know it will be sad to return and find so many familiar faces and friends gone, but I shall be glad to get back among you all and tell you more in full of this World War. I only hope and pray that there will never be another.*

Kindly remember me to all my friends and many thanks for the smoking tobacco you sent me for Christmas which has been a great treat. Wishing you and yours a Happy New Year, I remain

Very Sincerely,
R. Norris

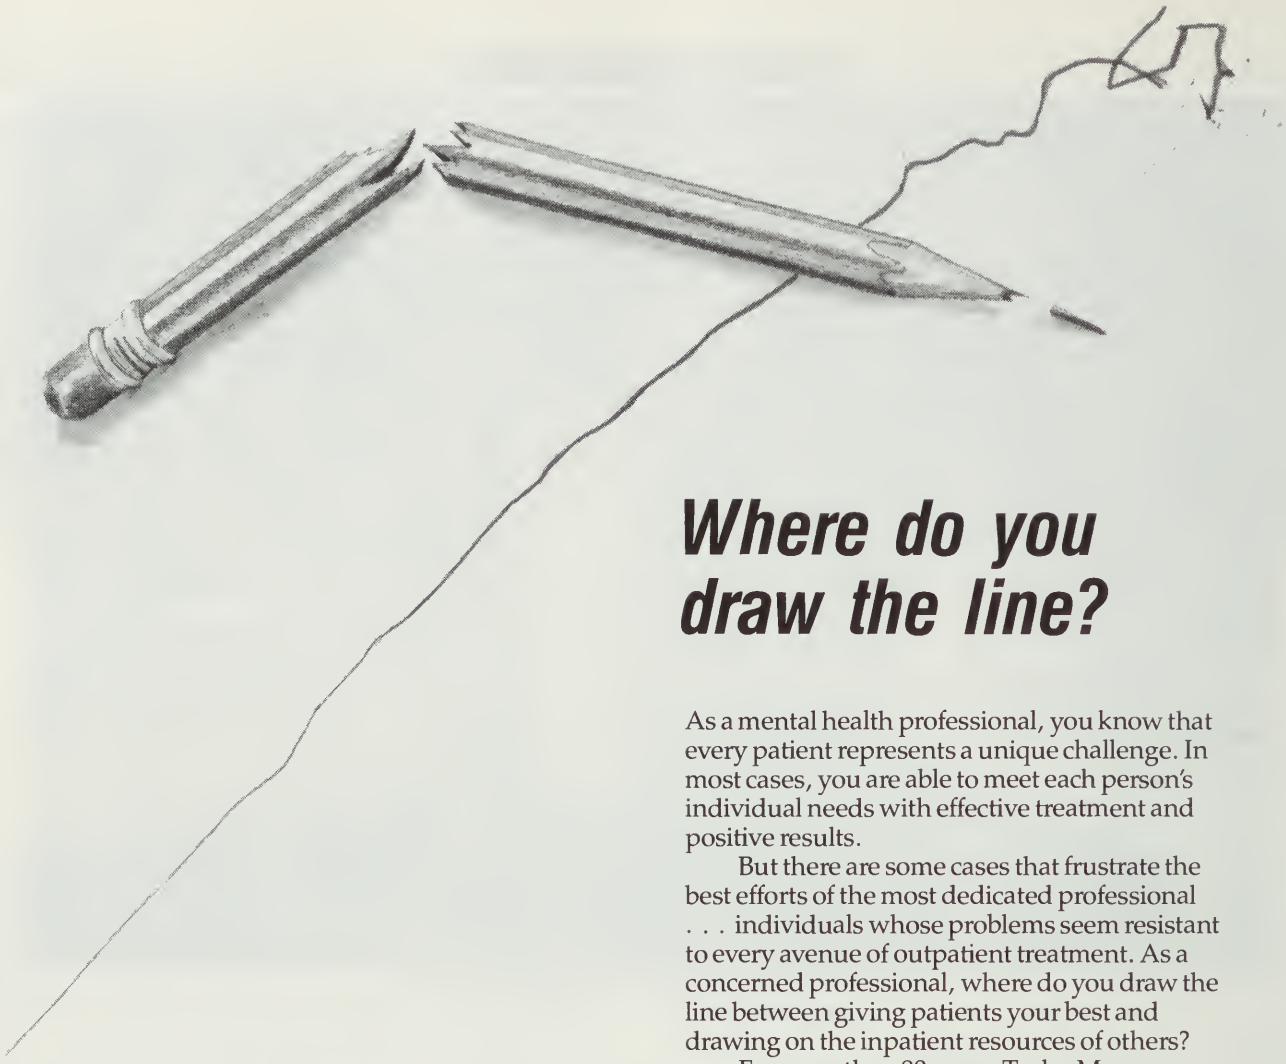
Base Pharmacy - Eighth Evacuation Hospital,
Camp Meade. Arthur Shipley Papers.

RASTUS RANSOM NORRIS
1881 - 1941

Rastus Ransom Norris came from a long line of distinguished military men. On his mother's side he could trace his family back to Joseph Evens, an American Revolution era soldier who fought with both Captain Joseph Crockett's 7th Virginia Regiment and Colonel Daniel Morgan's Rifle Regiment.

Norris' grandfather was Major Israel Robinson, a Major in the Confederates States Army who was killed in 1863.

Rastus Ransom Norris, the son of James L. Norris, an attorney and former treasurer of the Democratic National Committee, received his medical education at the University of Maryland Medical School, graduating in 1905. From there he went on to the Johns Hopkins Hospital for postgraduate courses.



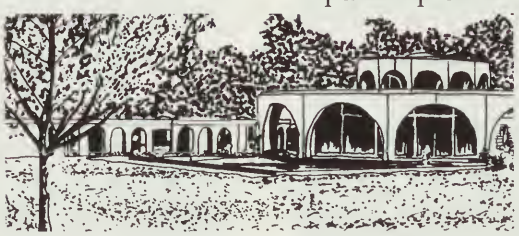
His work at Hopkins helped him gain an appointment in 1906 through 1907 to the staff at the old Bayview Hospital. The always-active Norris also undertook two new projects in 1907: Assistant Surgeon for the United Railway Company and until 1909, Assistant Police Surgeon for the City of Baltimore.

At the outbreak of American involvement in the war in Europe Norris received an appointment as Captain in the US Army Reserves Medical Corps. Sent to Europe with the 7th Sanitary Train, 7th Division, he eventually was placed in command of Field Hospital 36, where he remained throughout the war.

Commissioned a Major upon his retirement from active service in 1919 Norris stayed active in the medical profession until his death in 1941. He served as Examiner for the Veteran Bureau, as a member of the surgical staff of both the Edward W. McCready Memorial Hospital and the Somerset County Welfare Board, and was an active member of both the Somerset County Medical Association and the Eastern Shore Medical Society.

BILL SLEEMAN
Med Chi Archivist ■

A special note of thanks is due Dr. Conrad Acton. Doctor Acton, an active member of the Library and History Committee, has over the past several months donated several rare and fine medical texts to the History of Medicine Collection. With the rising costs of rare books on the open market, these donations are greatly appreciated.



Where do you draw the line?

As a mental health professional, you know that every patient represents a unique challenge. In most cases, you are able to meet each person's individual needs with effective treatment and positive results.

But there are some cases that frustrate the best efforts of the most dedicated professional . . . individuals whose problems seem resistant to every avenue of outpatient treatment. As a concerned professional, where do you draw the line between giving patients your best and drawing on the inpatient resources of others?

For more than 80 years, Taylor Manor Hospital has provided welcome support to fellow professionals faced with the patient in need of our inpatient setting. Our multi-disciplinary approach welcomes your input and provides a broad base of psychiatric services, including specialized treatment programs for adolescents, adults, young adults, addictive behaviors,and members of the ministering profession.

We're here to use all our experienced staff and facilities to assist you in working with your patients. For further information or to arrange admission, contact our Admissions Office at **1-800-527-8238, (301) 465-3322 or (202) 621-4965.**

Taylor Manor Hospital

ELLICOTT CITY, MD 21043

Highlights: Executive Committee and Council Actions

Executive Committee - June 15, 1989

1990 Annual Meeting - It was reported that the Committee on Scientific Activity has recommended that the Faculty's 1990 Annual Meeting be held at the Turf Valley Hotel and Country Club. However, there has been a substantial increase in the cost for the use of the meeting rooms at Turf Valley - $5,000 per day (last year's charge was $500 per day). The Executive Committee also was informed that with the approval of Dr. Jack Zimmerman, Chairman of the Committee on Scientific Activity, members of the staff looked at the the Hilton Hotel in Reisterstown as a possible site. Though the charge for the meeting rooms at the Hilton is considerably less than at Turf Valley ($1,000 per day), it is a much smaller facility and would not accommodate enough exhibits to make it profitable. Further, Dr. Bob pointed out that parking was inadequate for such a meeting at the Hilton.

Following discussion, the Executive Committee adopted a motion to recommend to Council that Med-Chi accept the terms of the Turf Valley Hotel and Country Club and schedule the 1990 Annual Meeting at that facility.

Standards of Care - MHA - The Executive Committee was advised that Dr. Atkins had appointed Dr. Victor Hrehorovich, Chairman of Med Chi's Hospital Medical Staffs Committee as Med Chi's representative to the Maryland Hospital Association's Council for Quality Health Care. As Med Chi's representative, Dr. Hrehorovich also will serve on the advisory committees addressing the C-section study, the ER physician credentialing issues, and activities involving laminectomies.

Medical Assistance Program - The Executive Committee accepted as information an update by Gerry Evans on the Brand Name Prescription Drugs and Alan Rifkin's report on the Medical Assistance Diversion Plan.

High Blood Pressure Commission - The Executive Committee was advised that recent notice from the Division of Appointments of the DHMH indicated that contrary to their earlier correspondence to Med Chi, Dr. Hilary O'Herlihy had served two terms on the Commission on High Blood Pressure and Cardiovascular Risk and, therefore, was ineligible to serve another term. The Executive Committee recommended that the component medical societies be contacted for additional nominees for this position and, once received in the Faculty office, the names be forwarded to the Council for consideration.

Medicolegal Committee - Dr. George Greenstein, Chairman of the Medicolegal Committee, presented proposed guidelines developed by the Medicolegal Committee concerning "Expert Physician Testimony and Reports," for review by the Executive Committee. The guidelines have been approved by the Baltimore City Bar Association; however, amendments to the guidelines are awaiting the approval of the Maryland Bar Association. The Executive Committee voted to refer the guidelines to the Council with a recommendation for approval, pending approval of the Maryland Bar Association.

Peer Review Management Committee - The Executive Committee accepted the Peer Review Management Committee's recommendation to address Med Chi's position in the evaluation of numerous and substantive modifications to the *Peer Review Handbook* as proposed by the Physician Quality Assurance Board.

Governor's Drug Summit - Med Chi participated in Maryland's first statewide drug summit that was held to discuss the development of new strategies to fight Maryland's drug problem. The Executive Committee considered the following resolution submitted by the Committee on Drugs and Committee on Mental Health:

> Resolved, That having been adequately trained in the treatment of drug problems, primary care physicians be encouraged to participate in the medical therapy of patients with drug problems with the widest latitude in therapeutic procedure and modality; and
>
> Resolved, That the Committee on Drugs and the Committee on Mental Health jointly assume the responsibility for coordinating these measures and report back to Council in six months on the results of its interventions.

Following discussion the Executive Committee adopted a motion to support the concept as presented in the resolution and to refer it to Council for consideration.

An analysis of drug consumption by state (ref. US Department of Justice Report, Drug Enforcement Administration, *Multiple Copy Prescription Programs Resource Guide*, July 1987) was provided for review by the Executive Committee. For clarification purposes, it was pointed out that Maryland ranked 36th during calendar years 1979-1985 in drug consumption per capita and was not the "worst state" as recently stated by an official of the Department of Health and Mental Hygiene. It was suggested that a letter from Med Chi be sent to the Department to clarify the issue.

Malpractice Suits by Medical Beneficiaries - National Data - The Executive Committee discussed a recent letter from Nelson Sabatini, Deputy Secretary for Health Care Policy, Finance and Regulation, DHMH, presenting national data suggesting that Medicaid or uninsured patients do not sue more often than other groups. Mr. Sabatini stated in his letter that only 13 percent of Maryland obstetric claims are filed by Medicaid recipients. Further, his office is conducting a study of Maryland Health Claims Arbitration Office filings to determine suit rate by the patient's payer category; findings should be available in the Fall.

Specialty Societies Committee - Following a review of the specialties represented on the former Ad Hoc Interspecialty Committee, the Executive Committee adopted a motion to forward the list of specialties to the Council with a recommendation for approval. In accordance with the bylaws of the newly formed Committee on Specialty Societies, the Council must approve the specialties before representatives may be appointed to the committee.

AIDS - The AMA Delegation requested clarification of Med Chi's policy on AIDS in order to address several AIDS resolutions to be considered during the AMA annual meeting in Chicago, June 18-22, 1989. Following review of the Omnibus AIDs bill passed in the 1989 Maryland General Assembly, the Executive Committee took the following positions on the resolutions:

Resolution #16 - Confidential Reporting of HIV Disease to the Health Departments
Recommended Action: *Support*

Resolution #18 - Declaration of AIDS as a Communicable / Sexually Transmissible Disease
Recommended Action: *Nonsupport*

Resolution #38 - AIDS Testing
Recommended Action: *Nonsupport*

Resolution #124 - Acquired Immune Deficiency Syndrome (AIDS) Reporting and Notification
Recommended Action: *Support*

■ ■ ■

Council - June 29, 1989

Committee Reports

Executive Committee

Membership Initiatives - Council, upon recommendation of the Executive Committee, adopted a motion to approve a proposal to provide component medical societies one-half of Med Chi's first year's dues for recruitment of each new member. This will assist in covering local medical society expenses, as well as provide an initiative for component society recruitment programs. This initiative is in addition to the present Council pilot program of allowing a $35 credit toward the dues of physician members who recruit a new member.

Specialty Societies - Council discussed at length the recommendation of the Executive Committee to approve a proposed list of specialties (as represented on the former Ad Hoc Interspecialty Committee) for consideration of representation on the Faculty's Committee on Specialty Societies. Dr. Joseph Snyder expressed concern that there was a need for established criteria specifying the membership qualifications of the specialties, such as the percentage of Med Chi members required in a specialty society, prior to action by Council. Following discussion, a motion was adopted to forward the issue to the Committee on Specialty Societies to transact as its first item of business and to report back to the Council. Also, it was agreed the composition of the Committee on Specialty Societies be the same as represented on the 1988 Ad Hoc Committee on Specialty Societies (which was formed to address the RBRVS project) and, further, those societies be allowed to remain represented in the newly designated committee for a period of at least two years so as to meet such membership criteria as approved by the Council.

Access to Health Care for Women and Their Families Conference - Council adopted a motion to provide a meeting place for a conference, "Access to Health Care for Women and Their Families," as requested by Marilyn Goldwater, Director, Office of Federal Relations of the Department of Health and Mental Hygiene. The conference is scheduled for November 1989. No monetary support will be provided by the Faculty due to present budget restrictions.

Committee on Scientific Activity - Dr. Jose Yosuico, Treasurer, on behalf of the Committee on Scientific Activity, reported that the committee had selected the Turf Valley Hotel and Country Club as the 1990 Annual Meeting site even though there had been an increase in the cost of the meeting space from $500/day to $5,000 per day. The meeting is scheduled for May 9 through 11, 1990. The Council approved both the meeting site and the dates as recommended by the committee.

Finance Committee - Dr. Yosuico, Treasurer, presented the financial statement for May 1989, which was accepted as information by the Council.

Medicolegal Committee - Dr. George Greenstein, Chairman of the Medicolegal Committee, presented the proposed "Guidelines concerning Expert Physician Testimony and Reports," which was accepted by the Council, pending the approval of the Bar Association.

Public Relations Committee - Dr. Hiroshi Nakazawa, on behalf of the Public Relations Committee, spoke to the continuation of the Media Awards Program with a request for approval of $3,215, $3,000 for cash awards and $215 for certificates and expenses in recognition of the outstanding efforts of medical journalists. Dr. Nagel, Council Chairman, pointed out that the Executive Committee had reviewed the matter and concurred with the recommendation of the Finance Committee that only $215 be expended for awards in the form of certificates due to the lack of interest on the part of the media in covering Faculty affairs during the past year. The Council agreed with the recommendation and approved an expenditure of $215 for the purchase of certificates as recognition awards for the media, in lieu of cash awards.

Drug Committee - Dr. Nelson Goodman, Chairman of the Drug Committee, and Dr.Kenneth Manilow, Chairman of the Mental Health Committee, spoke in

support of the following resolution, which, after an amendment to include the Uniformed Services University of the Health Sciences in the first resolving clause, was adopted as amended:

> Whereas, There is a catastrophic drug problem in the State of Maryland as well as nationally;
>
> Whereas, Governor Schaefer convened a statewide drug summit in which Med Chi participated;
>
> Whereas, Physicians have the basic pharmacologic and medical knowledge to prescribe many controlled substances; and
>
> Whereas, The physician already has a therapeutic relationship with the patient; therefore, be it
>
> Resolved, That Med-Chi work with the University of Maryland School of Medicine, The Johns Hopkins University School of Medicine, and the Uniformed Services University of the Health Sciences to develop programs of education in drug addiction management to be required for all medical students and to be offered to all physicians, which should include the use of advanced communication techniques including video tapes, and that CME credits should be offered;
>
> Resolved, That having been adequately trained in the treatment of drug problems, primary care physicians be encouraged to participate in the medical therapy of patients with such problems with the widest latitude in therapeutic procedure and modality; and be it further
>
> Resolved, That the Committee on Drugs and the Committee on Mental Health will jointly assume the responsibility for coordinating these measures and report back to the Council in six months on the results of its interventions.

Drs. Goodman and Manilow were congratulated for their work in developing this resolution and their involvement in this project.

AMA Delegation

AMA Report PP (Abuse of Prescription Drugs) - Dr. Antlitz, Chairman of the Faculty's delegation to the AMA, presented recommendations contained in the AMA Board of Trustees Report PP (Abuse of Prescription Drugs). Following discussion, the Council agreed to support the following recommendations of the AMA:

1. Oppose expansion of multiple-copy prescription programs to additional states or classes of drugs because of their documented ineffectiveness in reducing prescription drug abuse and their adverse effect on the availability of prescription medications for therapeutic use.
2. Continue to address the problems of prescription drug diversion and abuse through its highly successful programs, including PADS and PADS II, physician education and research activities,and continue to assist state societies in developing proactive programs.
3. Encourage further research into development of reliable outcome indicators for assessing the effectiveness of measures proposed to reduce prescription drug abuse.

AMA Reports BBB and EEE - Expenditure Targets (ETs)- During discussion, Dr. Lawrence Fink commented that physicians had hurt themselves more than any other group through the AMA and had allowed the federal government to implement ETs. Dr. Donald Lewers responded to Dr. Fink's comments, defending the AMA stating that the AMA was, indeed, actively involved in an attempt to have the ETs deleted from the Budget Omnibus Bill. He also stated that the AMA had published an ad in the *Washington Post* to inform the public and Congress about the inevitable rationing of care that would result from implementing expenditure targets in the Medicare program. Further discussion resulted in the adoption of a motion by Council that an 8th grade level readability paper be prepared to inform the public of the federal government's plan to place Expenditure Targets on physicians and to encourage them to contact their congressional representative in an effort to defeat the ETs issue. This matter will be referred to the Public Relations Committee for immediate action.

AMA Report JJ - Health Insurance Coverage for Employees - Dr. Antlitz presented the following recommendations of the AMA as contained in Report JJ and moved adoption of Item (2) as it pertains to the state level:

> (1) That the AMA endorse the concept of a phased-in requirment that employers (limited initially to larger employers) provide health insurance coverage *within the private sector* for all full-time employees, with coverage expanding over several years and with a program of diminishing tax credits or other incentives to avoid adverse effects on employers, and
> (2) That Med Chi continue to study all approaches to providing health services for the uninsured and work with business groups to develop approaches that are best suited to the needs of small employers.

Following adoption of the motion, Dr. Nagel stated that he would develop an ad hoc committee of the Council for purposes of studying this issue and report back to the Council during the September semiannual meeting.

Professional Ethics Committee - Dr. Louis C. Breschi, Chairman, presented the following ethical statements with a request for Council approval. The Council took action as noted with each statement:

Walk-In Clinics - APPROVED

Proposed for Deletion:

14. Walk-In Clinics - The Faculty views walk-in clinics as serving a useful purpose to the community. (MC 6/17/69)

Relationship with Public Relations Media - APPROVED

The only change recommended to the original policy statement 9 (Relationship with Comunications Media) is to substitute "Public Relations" for former references to "Communications" Committee throughout policy statement 9.

Release of Information - APPROVED

Revised Statement:

103. Release of Information - Except as provided by law or as authorized by the patient, a physician should not release medical information about a patient to any person.

(Note: Deletion - In its review of the Council's

policy statement 10 on the release of information to retail credit organizations, the Professional Ethics Committee decided to delete that statement in its entirety as unnecessaary in light of its proposed revision of Ethical Statement 103 on Release of Information.)

Dr. Marvin Schneider pointed out that in certain situations involving PRO organizations, there is a question of violation of ethics in providing the requested information on patients. The Committee on Professional Ethics was asked to explore this issue and develop guidelines for use in situations dealing with managed care organizations.

Pronouncement of Death - REMANDED TO COMMITTEE

Proposed Revision:

102. Pronouncement of Death - A body should be identified, viewed, and death verified by a physician. An exception to this directive may occur if a physician has seen a terminal patient whose death is reasonably anticipated. In that case, a person who is capable of recognizing cessation of respiration and heart beat may verify death for the physician and so advise him in a reasonable period of time.

Discussion ensued that resulted in a proposal to delete the word "terminal," and to insert the following phrase at the beginning of the proposed policy statement: "Unless exceptional circumstances warrant otherwise,..." After discussion, the Council voted to refer the matter back to the committee with the proposed amendments for further consideration.

Physician/Pharmacist Code of Cooperation - TABLED

The Council discussed the Revised Code of Cooperation and adopted a motion to table the issue until the next meeting of the Council to provide time for a more thorough review by Council members.

High Blood Pressure Commission - Additional nominees were provided the Council for consideration of appointment to the Commission on High Blood Pressure and Cardiovascular Risk Factors due to the ineligibility of Dr. Hilary O'Herlihy to serve another term. The Council approved the following names to be submitted to the Department of Health and Mental Hygiene for consideration of appointment of one to the Commission:

Francis T. Daly MD, Towson (Internal Medicine)
Daniel G. Sapir MD, Baltimore (Nephrology/Internal Medicine)
Donald H. Dembo MD, Baltimore (Cardiology)

New Business

White Paper - Dr. Atkins informed the Council that a letter would be sent to committee chairmen requesting the preparation of "white papers" on various important subjects. This prompted a request from Dr. Cheryl Winchell, President of the Montgomery County Medical Society, that the presidents of the component societies be consulted so the components may choose whom they wish to serve on Med Chi's committees. Dr. Atkins explained that each member of Med Chi, early in the year, is sent a card which lists the committees with a request to indicate their interest. Dr. Atkins further stated that he had asked some people with specific expertise to work with the committees in the preparation of the white papers.

Montgomery County Medical Society Statement - Dr. Lawrence Fink, Montgomery County, presented the following position statement to the Council:

> The Montgomery County Medical Society condemns, without reservation, the recent rump session meeting of members of the Executive Committee and selected members of component medical societies. This is not the first such meeting, which circumvents the bylaws and democratic process of this medical faculty.
>
> It is particularly ironic - and noteworthy - that several of the participants in this meeting were the same individuals who had voiced strenuous objection to the proposed amendment seating the Vice-Presidents on the Executive Committee, ostensibly because this would give inordinate power to the Committee, in place of Council.
>
> The Montgomery County Medical Society wishes also to serve formal notice that it will not accept representation by individuals who are chosen by others, outside of our component society, and who are not duly elected or appointed by our society as our representatives. We specifically disavow and disassociate ourselves from such individuals and from any policy-making decisions which affect our society, absent such representation.

Dr. Fink requested that this statement be placed in the minutes verbatim. No other comments were received and the Council Chairman so noted the request. Dr. Lewers, while not commenting on the Montgomery County statement, made a plea for continued unity and suggested that medical societies look at their similiarities, rather than focusing on their perceptual differences.

Emeritus Members - The following recommendation for Emeritus membership in the Faculty was approved for submission to the House of Delegates for consideration:

Baltimore County Seymour Weiner MD, Phoenix, Md.

Dues Waivers - 1989 Dues Waivers were granted to the following physicians:

Baltimore City Antonio K. Olmedo MD, Towson
Montgomery County John H. Bouma MD, Kensington

40-Year Membership Granted - Council voted to grant 40-year membership in the Faculty to the following physician as requested by the component society indicated

Baltimore City Eugenie E. Phillips MD, Baltimore

■ ■ ■

Executive Committee - July 20, 1989

Old Business

Position Papers - The Executive Committee was advised that Committee Chairmen have been requested to develop "white papers" on various subjects

that may become legislative issues in 1990. In addition, individual physicians with specific expertise have been added as ad hoc members to those committees charged with the responsibility of developing "white papers." It is envisioned that these papers will be developed by September 1, 1989 so they can be mailed to the component societies prior to the semiannual meeting. Any modifications will be made prior to the Council meeting during the seminannual meeting for presentation at the morning session of the House of Delegates on September 15, 1989.

Committee Reports

Committee on AIDS - The Executive Committee reviewed the minutes and recommendations from the Committee on AIDS meeting of June 9, 1989. After review and discussion, the Executive Committee will advise the Committee on AIDS to work conjointly with the Public Relations Committee in the development of AIDS educational programs for the public and Maryland school systems and report back to the Executive Committee. The request from the Committee on AIDS to forward a letter to all component societies asking them to encourage physicians who are treating AIDS and HIV-infected patients be placed on a referral list was discussed. This matter was previously addressed by the Committee on Professional Ethics, with the result that the AIDS Committee not set up a central referral system the medical community could use to obtain assistance in the management of AIDS/HIV positive patients. The Executive Committee agreed that this recommendation was still the appropriate avenue to follow at this time. The Executive Committee rejected the recommendation that members of the Committee on AIDS be allowed to represent Med Chi before the Legislature. The Committee on AIDS will be directed to identify such concerns in the development of the "white paper" on AIDS.

Public Relations Committee - Council, during its June 29, 1989, requested the Public Relations Committee to develop a flyer that could be easily understood by a person of an eighth grade education and that would feature names and telephones of the Maryland Congressional Delegation counties for the purpose of informing both physicians and patients about Expenditure Targets (ETs). The flyer was mailed to all Component and Specialty Societies and members of the Med Chi House of Delegates and will be available to all Med Chi members in the August issue of *Maryland Medical Journal.* In addition to the flyer, letters describing the negative aspects of ETs were mailed to the editors of *Baltimore Sun* and *The Washington Post.* On July 18th, Med-Chi mailed letters to the eight members of the Maryland Congressional Delegation urging them to oppose ETs. Gerry Evans personally telephoned each member of the Maryland Congressional Delegation to state Med Chi's position on ETs.

The Public Relations Committee also recommended during its July 19, 1989 meeting that the following action be taken in regard to ETs.

- Med Chi should initiate an auxiliary telephone campaign to ask physicians to educate their Medicare patients on ETs and encourage them to phone their congressmen.
- Med Chi should send editorials explaining ETs to publications for senior citizens.
- Med Chi's component societies should work with local senior centers to educate Medicare recipients on ETs.
- Med Chi should develop a new flyer on ETs to send to physician offices and senior centers throughout the state.

Public Health Committee - The Executive Committee accepted the June 20, 1989 minutes of the Public Health Committee. Dr. Harrold Elberfeld, Chairman of the Subcommittee on Maternal Welfare, has prepared a draft letter of response to Delmarva Foundation concerning implications of birth of live fetuses in second trimester. Background information revealed that Dr. R. Lane Wroth, Medical Director of Delmarva Foundation, wrote to Dr. John Hawkinson requesting the Maryland Obstetrical/Gynecology Society's guidance regarding second trimester therapeutic abortions. The Executive Committee deferred action on the draft letter of response and agreed that the Maryland Obstetrical/Gynecology Society should formally request an opinion from Med-Chi on this issue through the Subcommittee on Maternal Welfare. This information will be relayed to Dr. Rivers.

Ad Hoc Committee on Employee Health Insurance Coverage - The Executive Committee accepted for information the appointment of an ad hoc committee to continue to study all approaches to providing health services for the uninsured. The Ad Hoc Committee will make its report to the Council at the Seminannual Meeting in Ocean City, September 14-16, 1989.

Committee on Drugs - The Executive Committee reviewed the minutes of the Committee on Drugs of July 11, 1989. The Executive Committee adopted a motion to forward a letter to the Governor's Advisory Council on Drug Abuse requesting that the Medical and Chirurgical Faculty of Maryland be allowed to provide formal input into the 1990 Legislative Session regarding triplicate prescriptions.

Committee on Managed Care and Third-Party Liaision - Dr. Aristides Alevizatos, Chairman of the Committee on Managed Care and Third-Party Liaison, presented recommendations from the Committee on Managed Care and Third-Party Liaison meeting of July 12, 1989. Recommendation #1 would allow committee members to proceed with meetings involving the senior executive staff and members of the Board of Directors of Blue Cross and Blue Shield of Maryland to address concerns of the physicians in Maryland. The Executive Committee adopted a motion to approve recommendation #1 to include other

third-party health care providers. The Executive Committee was advised that a reorganization of Maryland Blue Cross and Blue Shield was in process.

Recommendation #2 would direct the Legislative Committee to address Article 48A, Section 470U requiring reimbursement within 30 days of the proper filing of a claim with all necessary documentation. The law does not apply to claims to which there is a good faith dispute regarding the legitimacy of the claim on the appropriate amount of reimbursement. The Executive Committee referred recommendation #2 to Governmental Relations for immediate action as well as charged the Committee on Managed Care and Third Party Liaison with the responsibility of developing a "white paper" on proposed legislative activity.

Recommendation #3 requests that the Executive Committee authorize the evaluation legal or legislative channels available to correct the problems encountered with independent auditing companies. The Executive Committee asked legal counsel to investigate the legality of these auditing companies and report back to the Executive Committee and Committee on Managed Care and Third-Party Liaison.

Recommendation #4 requests that an announcement be placed in the *MMJ* encouraging Faculty members to report reimbursement problems to the Committee on Managed Care and Third-Party Liaison. The Executive Committee approved this recommendation.

Committee on Hospital Medical Staffs - Dr. Victor Hrehorovich, Chairman of the Committee on Hospital Medical Staffs, presented the following resolutions for consideration by the Executive Committee.

Recommendation #1 proposes that third-party funds paid to hospitals toward designated and legally mandated medical quality assurance peer review and credential activities be directed to the organized medical staffs to support the required activities, permit the medical staffs to engage in the necessary administrative support, and compensate medical staff officers and committee members devoting the required time to properly discharge these obligations. The Executive Committee supports this resolution in principle and will forward it to Council for consideration.

Recommendation #2 requests that the Medical and Chirurgical Faculty of Maryland consider developing a uniform due process and fair hearing procedures for all hospital medical staff members whose privileges may be restricted prior to the reporting of such actions to state and federal agencies. The Executive Committee supports this resolution in principle and will forward this recommendation to Council for consideration.

Recommendation #3 requests that the Medical and Chirurgical Faculty of Maryland consider adopting the position that any Med Chi member serving on committees of outside organizations that may develop positions regarding standards of medical care should be designated by Med Chi to serve in such a capacity and receive appropriate compensation for professional time. Such selected Med Chi representatives should report to Med-Chi the ongoing activities of the stated organizations and be adequately prepared to present established Med Chi positions on the issues being considered.

Recommendation #4 requests that the Medical and Chirurgical Faculty of Maryland consider supporting the AMA Third National Medical Staff Conference, October 19-21, 1989 in Washington, DC and further requests that the Maryland Hospital Association and all elected hospital medical staff officers be notified about the advisability of attending this conference. The Committee on Hospital Medical Staffs also recommends that Med Chi consider developing a similar conference by the beginning of 1990 to address the same issues within the context of Maryland statutes and administrative regulations. The Executive Committee adopted a motion to approve this recommendation.

Committee on Scientific Activity - The Executive Committee was advised that the Accreditation Council for Continuing Medical Education approved reaccreditation of theMedical and Chirurgical Faculty of Maryland for two years. A deficiency noted by the Accreditation Review Committee with respect to the continuing medical education program was as follows: lack of documentation that the organization is integrally involved with all aspects of the projects that it jointly sponsors. The Committee on Scientific Activity will expand its version of the cosponsorship policy for presentation to the Council at its September 1989 meeting as well as to satisfy the requirements dictated by the Accreditation Council.

New Business

Panel Discussion - Cliff Gilbert, Executive Director, PGCMS, informed the Executive Committee that the University of Maryland is sponsoring a panel discussion on October 11, 1989 relevant to developing criteria for providing health care to senior citizens with a view toward age considerations. He requested a Med-Chi representative to appear on the panel.

■ ■ ■

Executive Committee - August 16, 1989

Alcoholism and Chemical Dependency Committee - The Committee on Alcoholism and Chemical Dependency requested adoption of a resolution on the "Responsibility for One's Behavior While Under the Influence of Alcohol," the resolving clause of which reads:

> Resolved, That the Medical and Chirurgical Faculty of Maryland supports serious consideration be given to requiring both treatment and legal sanctions in adjudication of alcohol related offenses such as DWI, as said legal sanctions may actually motivate a person to pursue a program of recovery.

The Executive Committee adopted a motion by Dr. Nakazawa to refer the resolution to Council for its consideration.

Committee on Scientific Activity - It was again reported that the difficulty Med Chi has been having in selecting sites for the annual meetings still exists due to the requirement of hotels that a certain number of their sleeping rooms must be booked in order to use their facilities for meetings.

Following discussion, the Executive Committee **adopted a motion** by Dr. Dobridge that the Scientific Activity Committee provide the Executive committee with specific recommendations as to prospective sites and costs associated with the annual meeting three years in advance of the meetings, and if sites cannot be found, consider changing the format of the meetings, and report back to the Executive Committee before the semiannual meeting in September.

Physician Rehabilitaion Committee - The Executive Committee discussed the financial section of the Physician Rehabilitation Committee's report of July 28, 1989, in which the committee expressed its opinion that "money brought in by the Physician Rehabilitation Program should be utilized by and for the Physician Rehabilitation Program."

The Executive Committee **adopted a motion** presented by Dr. Bob, as amended, that a letter be drafted to the Committee on Physician Rehabilitation indicating that final decisions concerning all Faculty funds must be made by the Council and that this had been addressed by the Executive Committee in a letter of April 7, 1987 to the Physician Rehabilitation Committee.

DHMH - Multiple Prescription Plan under Medicaid Program - Dr. Nagel proposed that a letter be sent to Mr. Nelson Sabatini in response to the DHMH's letter of August 10, 1989 in which they plan to send letters to Medicaid patients, age 65 or older, who are under the care of more than one physician. The DHMH letter will list the physician prescriber's name and the drug prescribed, and instruct the patient to share the letter with their physicians in an attempt to prevent unintended drug reactions.

Following a lengthy discussion, the Executive Committee **adopted a motion** by Dr. Bob authorizing a letter to be sent to Mr. Sabatini (copy to Dr. Gary Rosenberg, Chairman of the Liaison Committee with the DHMH and Dr. Susan Guarnieri, Legislative Committee Chairman), indicating Med Chi's displeasure with the manner in which this program was conveyed to Med Chi. In particular, a luncheon meeting with Mr. Sabatini was held on August 9 with Drs. Susan Guarnieri and Gary Rosenberg being present, as well as Med Chi staff, Gerry Evans and Angelo Troisi, and there was no mention of the program. It was felt by the Executive Committee that Mr. Sabatini should have informed Drs. Guarnieri and Rosenberg of this new "notification to patients" program during the meeting of August 9, rather than the way in which it was addressed.

It also was moved that the letter indicating Med Chi's displeasure should be forwarded by the President, who was out of state on official business and was not present to accomplish that task. It was then moved and approved that the President-elect sign the letter that was read to the Executive Committee.

Dues Billing Language - As Acting Chairman of MPAC, Dr. Bob reported that because language on the current dues bill instructs members to write a check for their MPAC dues on a personal check as opposed to a corporate check, it may restrict physicians from writing a check for MPAC.

Dr. Bob presented a **motion, which was adopted**, that the Executive Committee authorize a change in the sentence on the current dues bill regarding MPAC dues that reads "If your practice is incorporated, MMPAC and AMPAC voluntary political contributions should be written on a PERSONAL CHECK." The new language to be incorporated on the dues bill is as follows:

> Contributions may be written on corporate or personal checks. Those using personal checks will be members of MMPAC and AMPAC....

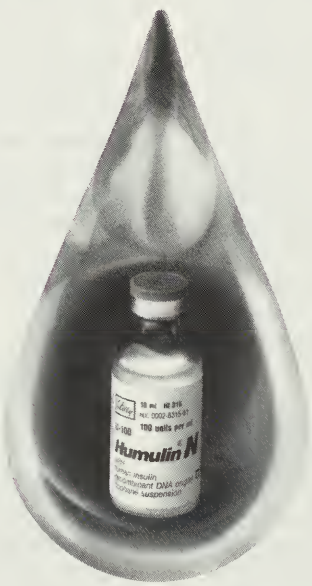
Law Firm of Rifkin, Evans, Silver and Lamone - Following an introduction of Mr. Alan Rifkin and Mrs. Linda Lamone to the Executive Committee, Gerry Evans announced that he had signed an agreement with Alan Rifkin, Judge Edgar Silver, and Linda Lamone today to join as partners in the law firm of Rifkin, Evans, Silver and Lamone. He also stated that Jean Bienemann has resigned from the Faculty and had accepted a position with the state. At Dr. Nagel's request, Mr. Rifkin and Mrs. Lamone provided information on their legal background. A contract for professional services between Med Chi and the law firm was offered. Further discussion of this matter was deferred to executive session.

■ ■ ■

Executive Committee Special Meeting - August 24, 1989

Finance Committee - The Executive Committee reviewed and accepted the Parliamentarian's explanation of the bylaws, Article III, Finance, Section 10.

Following discussion of the report of the Finance Committee, a motion was adopted to forward the report to the Council. ■



For treatment of diabetes:

Introducing
Humulin® 70/30
70% human insulin isophane suspension
30% human insulin injection
(recombinant DNA origin)

REPLACE
Human Insulin

With Human Insulin

Humulin®
human insulin
(recombinant DNA origin)

Any change of insulin should be made cautiously and only under medical supervision.

AMA-ERF - The Blitz Is On

What is AMA-ERF? And why should you support it? Those questions will be answered in medical society and auxiliary publications and meetings across the nation during the next two months, as a result of a publicity blitz launched by the AMA Auxiliary AMA-ERF Committee. Those who wonder why the committee would choose as an audience the very people who have helped the AMA Auxiliary contribute $48 million to the American Medical Association Education and Research Foundation since 1953 have only to listen to AMA-ERF Committee Chairman Gayanne Burns. "We believe we need to remind physicians and their spouses how important it is that they support medical education today and why AMA-ERF is the vehicle through which to do it for two reasons."

"First, many of our long-term members and their physician-spouses have become so used to giving to AMA-ERF that they don't think about what it is and why they are giving," Mrs. Burns said. "As a result, they may not realize that their contributions are more important today than ever, and new auxiliary members often don't have any idea what the foundation is or why we urge them to support it.

"Second, we find that some people think money goes to help some community across the nation. Sometimes they choose to support something closer to home," Mrs. Burns went on. "We want people to know that when they designate contributions to AMA-ERF to their local medical school, those contributions will stay at home."

Mrs. Burns feels strongly that the medical community should support AMA-ERF—so strongly that she turned down two highly prized local volunteer positions in Chattanooga, TN to chair the AMA Auxiliary's committee. The reason is highly personal but one to which she believes many auxiliary members can relate. "When I was a brand new member of the auxiliary, I didn't understand what AMA-ERF was or why I should support it. I think I had been active for more than a year when, after an auxiliary meeting at which I was asked to contribute to the foundation, I asked my husband if he knew about AMA-ERF. He said that when I wrote a check to pay back his medical education loan every month, I was returning money AMA-ERF had helped him get. Like many medical students, he needed money to pay for his education. And like many medical students, he had no one to co-sign for a loan. AMA-ERF did it for him, and he has never forgotten it. It means so much to him."

In 1980, due to economic conditions, the foundation was forced to suspend the Guaranteed Loan Program that helped L. Phillip Burns and many other medical students attain their MD degrees. But not before AMA-ERF had arranged and guaranteed more than $95 million in bank loans for medical students in need of funds. Unlike Dr. and Mrs. Burns, many of those who received the loans have defaulted, leaving the foundation responsible for their debts. As of December 31, 1988, $8.1 million in loans remain outstanding, while $12.6 million have been purchased by AMA-ERF as defaulted loans. Today, those who support AMA-ERF can choose to designate contributions to one of two funds:

- the Medical School Excellence Fund, which provides grants to medical schools to use as they see fit—for building improvements, faculty salaries, library books, or student loans and grants; or
- the Medical Student Assistance Fund, which provides money to medical schools to use in direct financial aid to students.

In addition to designating contributions to the fund of choice, contributors can decide where their contributions will be used. Contributions to the foundation's Medical School Excellence Fund, for example, can be designated to benefit an alma mater or local medical school. Contributions to the foundation's Medical Student Assistance Fund can be donated to benefit students at a particular medical school, but not particular students. In addition to these funds, the foundation has a Development Fund, used at the discretion of the AMA-ERF Board of Directors to support pilot and experimental health and medical programs; and Categorical Funds, which are provided to specific research areas that last year included biomedical research in rheumatoid arthritis, non-lymphocytic leukemia, muscle regeneration, and the origin of AIDS in the United States. AMA-ERF also awards the annual Rock Sleyster Memorial Scholarship. Established in 1974 by a bequest from the widow of AMA Past-President Rock Sleyster, the scholarships go to medical students in their last year of medical school who have demonstrated a specific interest in psychiatry. The AMA-ERF Committee hopes this and other information will be communicated through the publicity blitz, which will focus on both the national scope of AMA-ERF and how it affects local communities. The committee has asked its state and county auxiliary counterparts to place articles about the foundation in auxiliary and medical society publications in September and October, as well as to schedule informational programs at medical society and auxiliary meetings. In addition, state and county AMA-ERF Committees have been asked to contact the deans of local medical schools to ask them to write letters that can be shared with medical society and auxiliary members and that outline what the foundation has meant to their schools and their students. Mrs. Burns believes that the all-out effort will result in more support for the foundation and its work because people will understand what AMA-ERF is and does,

as well as why the foundation needs their continued support.

"We want the medical community to feel what we feel—a responsibility to make sure that medical schools have money to train their students to maintain the quality of medical care today's doctors have worked so hard to establish," Mrs. Burns said. "And we want them to understand how urgently the foundation needs their support if that goal is to be accomplished."

For more information on the American Medical Association, Education and Research Foundation, contact Maryland Auxiliary's AMA-ERF State Chairman, Elizabeth Linhardt (Mrs. Elmer G.), 3 Chesapeake Ave., Annapolis, MD 21403 or Med-Chi's Auxiliary office.

This article appears with permission of the National AMA-ERF Chairman, Gayanne Burns. ■

Announcement

American Medical Association
Hospital Medical Staff Section
Fourteenth Assembly Meeting
November 30 - December 4, 1989

Medical Staffs from across the country are encouraged to elect a medical staff representative to participate in the AMA-HMSS Assembly meeting November 30 - December 4, 1989 at the Sheraton Waikiki Hotel in Honolulu.

The HMSS Assembly provides medical staffs with a unique opportunity to discuss and participate in the policymaking process of the AMA. In addition to the Assembly Meeting, the HMSS will sponsor an educational program on a topic of interest to medical staffs.

For further information about the AMA-HMSS, please call 312-645-4754 or 645-4761.

MEDICAL MALPRACTICE DAZE

"Good news, George! I just found out we may be able to save some big bucks on our medical malpractice premiums."

"Tell me about it."

"Well, Bill Garrett says we can qualify for a 12½ per cent discount from Princeton Insurance Company because we have privileges at a hospital that's also insured by Princeton."

"Who's Bill Garrett?"

"He's one of the top brokers in the State. Bill's been specializing in medical malpractice for over 20 years."

"Sounds like he understands our business."

"That's an understatement. Bill's solving problems I didn't even know we had!"

"How did you find out about Bill?"

"I saw the ad for William C. Garrett & Associates in the **Maryland Medical Journal**, got some really excellent references from some of our colleagues, and then I called his toll-free number."

"Smart thinking, Bob. Smart thinking!"

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

In the Matter of
Vincent Tomasino MD
Before the
Maryland Board of
Physician Quality Assurance

Application for Reinstatement
Consent Order

On December 27, 1983, the Commission on Medical Discipline (the "Commission") charged Vincent Tomasino MD (the "Applicant") with violation of the Maryland Medical Practice Act (the "Act"). Specifically, the Commission charged Applicant under Section 14-504 (3) of the Act which states:

> Subject to the hearing provisions of Section 14-504 of this subtitle, the Commision on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend of revoke a license if the licensee is guilty of immoral conduct in the practice of medicine.

The basis for the charge was that Applicant has a sexual relationship with a female psychiatric patient while he treated the patient from August 1980 through April 1982.

On December 28, 1988, the State Board of Physician Quality Assurance (the "Board") notified Applicant of the Board's intent to deny reinstatement of Applicant's license to practice medicine in the State of Maryland pursuant to Section 14-305 (a) of the Act. Section 14-305 (a) of the Act provides that to qualify for a license, the applicant must meet certain requirements. One of the requirements is that the applicant shall be of good moral character. See Md. Health Occ. Code Ann. Section 14-305 (b) (1988 Cum. Supp.). The Board charged that Applicant did not possess good moral character. The notice of Intent to Deny Reinstatement alleged the following:

1. Applicant was licensed to practice medicine in the State of Maryland under License Number D16338. Applicant's license expired September 30, 1987, when the Applicant failed to submit a renewal application.*
2. On January 19, 1988, the Board of Medical Examiners received an Application for Reinstatement of License.
3. From August 1980 through April 1982, Applicant engaged in sexual relations with a psychiatric patient whom Applicant was treating for a psychiatric problem.
4. Having sex with a patient is indicative of a lack of good moral character.
5. On February 18, 1988, the Board of Medical Examiners voted to deny applicant's application for reinstatement on the grounds that Applicant lacked good moral character. The Board of Medical Examiners notified Applicant of this action and informed Applicant of his right to request a formal hearing in a letter to Applicant on April 7, 1988.
6. On June 23, 1988, the Board of Medical Examiners met with Applicant and William Ehrmantraut, Counsel for Applicant.†
7. On June 30, 1988, the Board of Medical Examiners notified Applicant that the Board of Medical Examiners upheld their previous decision to deny the application for reinstatement on the ground of "lack of good moral character."

Findings of Fact

1. Applicant was licensed to practice medicine in the State of Maryland on February 28, 1974. Although Applicant did not submit a renewal application on or before September 30, 1987, Applicant's license did not expire on September 30, 1987, because of the pending disciplinary action by the Commission. Applicant is currently licensed to practice medicine in Maryland.
2. From August 1980 through April 1982, Applicant had a sexual relationship with a female psychiatric patient whom Applicant was treating for a psychiatric problem.
3. Applicant, recognizing the inappropriate and improper nature of such conduct sought and received psychiatric treatment from Dr. Robert M.A. Hirshfeld from May 21, 1984 until January 1987. Since then Dr. Hirshfeld saw Applicant in June 1987, December 1987, January 1989, and February 1989.
4. Applicant admitted that the conduct described in paragraph 2 above represents immoral, unacceptable, and grossly inappropriate professional behavior and can be damaging to the patient.
5. There is no evidence that similar activities of the kind described in Paragraph 2 above have occurred in Respondent's practice since 1982.
6. Since June 1983, Applicant has not practiced medicine in Maryland.
7. Since September 1983, Applicant has been employed full time for the Veterans Administration Hospital in Washington, DC in the inpatient department and the outpatient clinic.
8. Psychiatric evaluations by Dr. Jonas R. Rappeport and Dr. Robert M.A. Hirschfeld found that the conduct described in paragraph 2 above is not likely to occur.

Conclusions of Law

Based on the foregoing findings of Fact, the Board concludes:

*Applicant failed to timely submit such an application because such application was mailed to an incorrect address, thereby causing an untimely filing by the applicant.

† This June 23, 1988 hearing was an informal one and thus not the formal hearing contemplated by paragraph 5.

1. Applicant violated Md. Health Occ. Code Ann. Section 14-504 (3) (1981);and

2. Applicant has demonstrated that he would otherwise qualify for licensure in accordance with Md. Health Occ. Code Ann. Section 14-305 (1988 Cum. Supp.).

Order

Based on the foregoing Findings of Fact, it is this 4th day of August 1989,

ORDERED that Vincent Tomasino MD, a physician licensed to practice medicine in Maryland is hereby formally Reprimanded; and it is further

ORDERED that the Board shall renew Applicant's application for reinstatement of this license to practice medicine in Maryland subject to the following conditions:

1. Applicant shall notify the Board by certified mail return receipt requested, when he intends to open a private psychiatric practice; the psychiatric practice shall be limited to treating male patients for one (1) year;

2. Applicant may begin seeing female patients in the private psychiatric practice *only* after prior approval by the Board, and that approval may not be requested prior to one year from the date on which Applicant begins a private psychiatric practice.

3. Applicant's private psychiatric practice shall be supervised by a psychiatrist approved by the Board once every three months for a period of one (1) year beginning three (3) months after the date he begins private psychiatric practice;

4. Applicant's psychiatric practice shall be subject to peer review by a peer review committee designated by the Board in six (6) month intervals for a period of three (3) years beginning six (6) months after Applicant notifies the Board that he is starting his private psychiatric practice;

5. Applicant shall continue to receive psychiatric care from Dr. Robert M.A. Hirschfeld and shall arrange to have Dr. Hirschfeld submit quarterly written reports, the first to be due three (3) months from the date of this Consent Order, to the Board evidencing his continuing cooperation and satisfactory progress. Applicant's continuing psychiatric care under Dr. Hirschfeld shall terminate one (1) year from the date of this Consent Order; and it is further

ORDERED that any public disclosure of the foregoing findings of Fact and Conclusions of Law shall consist of the contents of this Order as permitted by Md. State Government Article Code Ann. Section-10-617(h) (1984).

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby accept and agree to be bound by the foregoing Order and its conditions and restrictions, consisting of six pages.

1. By signing this consent, I hereby submit to this Order and its conditions. I acknowledge the Board's jurisdiction and the validity of this Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protection provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this consent, I waive all such rights. Should the Board not approve this Consent, Applicant shall not waive any right to a formal hearing and an attendant appeal.

2. I understand that if I fail to comply with the conditions enumerated above, then the Board may act on the Notice of Intent to Deny Application for Licensure after notice and an opportunity for a hearing.

3. I am represented by William Ehrmantraut, Esquire, and I have consulted with him before signing this Order. I sign this Order voluntarily, fully understanding its meaning.

YOCON®
YOHIMBINE HCl

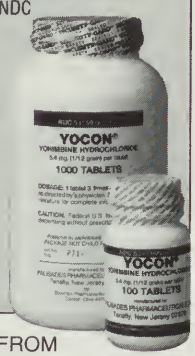
Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.



Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

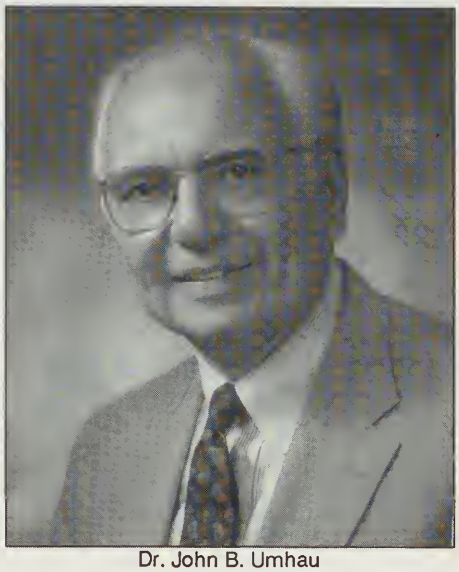
Lee A. Goodman MD, Baltimore, and *Gerald S. Johnston MD*, Bethesda, recently were named as Fellows of the American College of Radiology (ACR) at the ACR annual meeting in Seattle, WA. Selected for their outstanding contributions to the field of radiology, Drs. Goodman and Johnston were named among the 107 new Fellows by the College's Board of Chancellors.



Fellowships in the College are awarded for significant scientific or clinical research in the field of radiology or significant contributions to its literature. Criteria for selection also include performance of outstanding service as a teacher of radiology, service to organized medicine, and an outstanding reputation among colleagues and the local community as a result of long-term superior service.

Dr. Theodore C. Patterson

Theodore C. Patterson MD, Dundalk, was elected President of the Medical Alumni Association of the University of Maryland, Inc. at the 114th Annual Reunion. A 1962 graduate of the University's School of Medicine, Dr. Patterson served a three-year term on the Board of Directors of the Alumni Association, as well as holding the office of President-elect in 1988-89.

On staff at Franklin Square and Church Hospitals and Harbor Medical Center, Dr. Patterson is a diplomate of the American Board of Family Practice and a charter member of the American Academy of Family Practice. Dr. Patterson is a past-president of the Baltimore County Medical Association.

Dr. John B. Umhau

John B. Umhau MD, Chevy Chase, a 1952 graduate of The George Washington University School of Medicine, has been named president of the School's Alumni Association. A Family Physician, Dr. Umhau is past-president of the Montgomery County Medical Society, The Maryland Academy of Family Physicians, and the Metropolitan Council of Medical Societies. He served on the Council of Med Chi for many years. He is chairman of the Family Practice Section of the Southern Medical Association.

Referring to the more than 700 alumni of The George Washington University School of Medicine who live in Maryland, Dr. Umhau said, "We hope to involve many more local alumni in events sponsored by the Association."

■ ■ ■

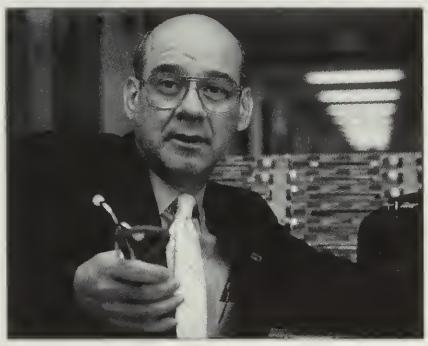
Frederick W. Walker MD, Forest Hill, directed a study session on the anatomy of the hand at the National Youth Science Camp held in Bartow, WV in July. The camp honors the two top science students, graduated from high school, for each state and from the District of Columbia, with three weeks of intensive lectures, seminars, directed studies, and outdoor activities. This program is unique in the nation and has been ongoing for 26 years.

Dr. Walker's sessions enabled 12 of the campers to perform dissections under supervision and to present their findings to the remainder of the camp members. Dr. Walker is a practicing General and Hand Surgeon in Harford County. ■

The Personality Disorder Treatment Program of Sheppard Pratt Hospital

Very often, specialized inpatient evaluation and treatment is a critical step in the effective long-term care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.



We offer:

- ☐ Extended stay intensive inpatient treatment
- ☐ Intermediate stay crisis intervention
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychopharmacology evaluation and treatment
- ☐ Psychotherapy consultation

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

6501 North Charles Street
Baltimore, Maryland 21285-5815

Sheppard Pratt

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

MGMA MEDICAL GROUP MANAGEMENT ASSOCIATION

Dear Doctor:

Does your practice manager:

- know how to maximize your practice income?
- understand the recent changes in the Medicare program?
- have good audit control procedures in place?
- supervise the front and back office staff effectively?
- evaluate patient satisfaction and marketing efforts periodically?

If you are not certain, recommend that your manager join MARYLAND MEDICAL GROUP MANAGEMENT ASSOCIATION — "The Organization for the Medical Practice Professional."

For More Information Write:
P.O. Box 5223
Baltimore, MD 21224

ARMY RESERVE OFFERS NEW FINANCIAL INCENTIVES FOR RESIDENTS IN ANESTHESIOLOGY AND SURGICAL SPECIALTIES

If you are a resident in Anesthesiology, Orthopaedic Surgery, or General Surgery including Neurosurgery, Colon/Rectal, Cardiac/Thoracic, Pediatric, Peripheral/Vascular and Plastic Surgery, the Army Reserve has a new and exciting opportunity for you. The New Specialized Training Assistance Program will provide you with financial incentives while you're training in one of these specialties.

Here's how the program can work for you. If you qualify, you may be selected to participate in the Specialized Training Assistance Program. You'll serve in a local Army Reserve medical unit with flexible scheduling so it won't interfere with your residency training, and in addition to your regular monthly Reserve pay, you'll receive a stipend of $678 a month.

You'll also have the opportunity to practice your specialty for two weeks a year at one of the Army's prestigious Medical Centers.

Find out more about the Army Reserve's new Specialized Training Assistance Program. Call (collect) your U.S. Army Medical Department Reserve Personnel Counselor:

American City Bldg., Suite 307
10227 Wincopin Circle
Columbia, Maryland 21044

ARMY MEDICINE. BE ALL YOU CAN BE.

One Clear Choice

When a physician's reputation and financial security may be on the line, we believe that simply choosing a good medical malpractice insurance company is not enough. Price and customized coverage should be the *very* best match for your needs... today *and* in the future. Service, by broker and company alike, should meet equally high expectations. At the Harjes Agency, we believe your best medical malpractice choices begin when you have chosen the best broker.

The Best Choices Begin with the Best Broker

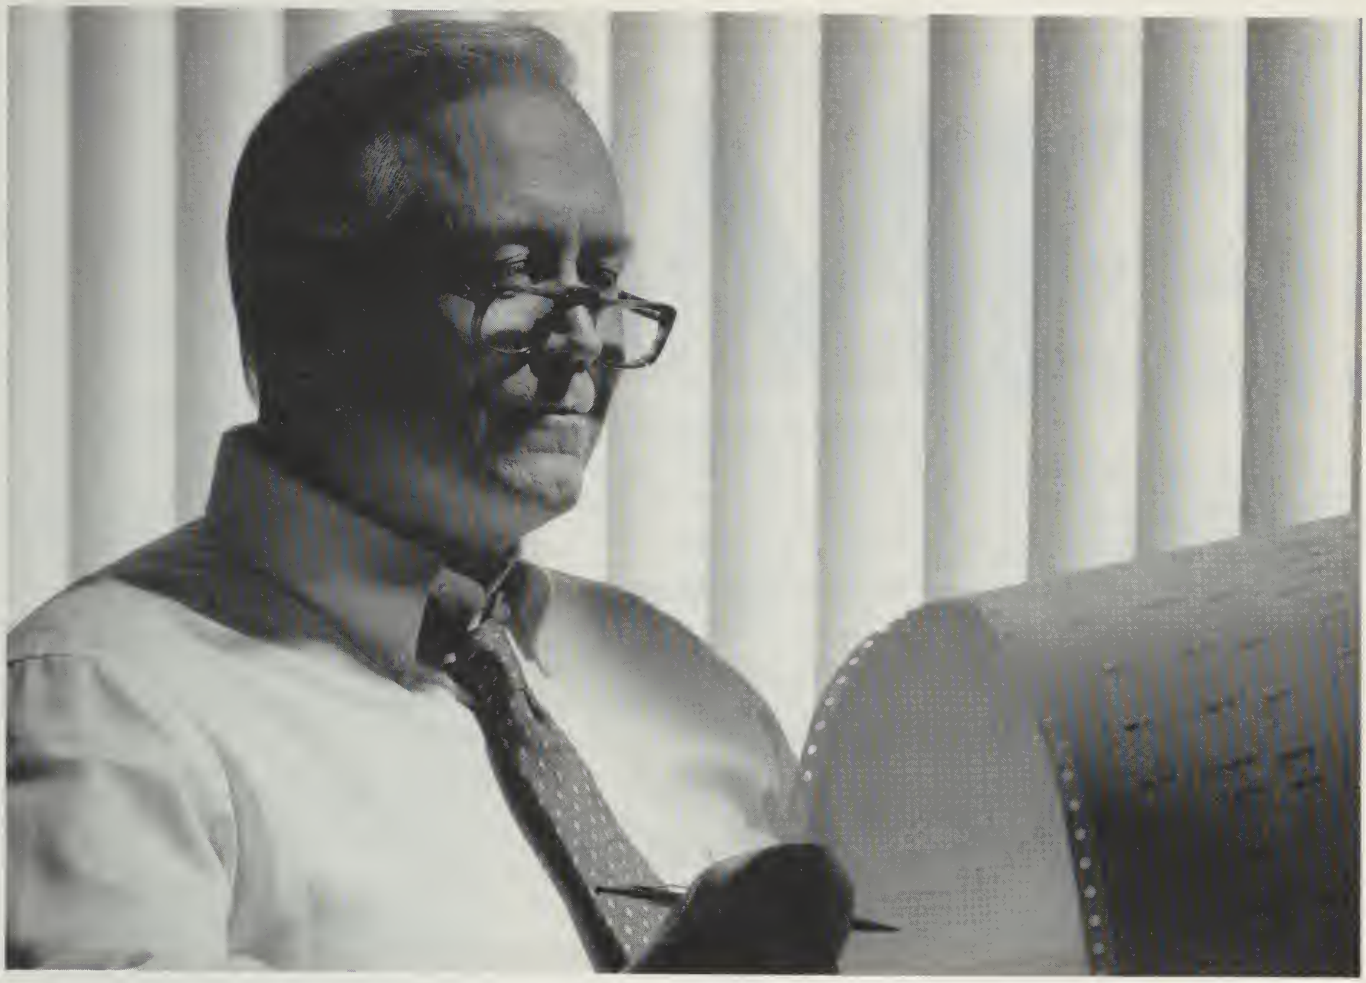
Maryland. Tried & True.

It's true. In today's rapidly changing health care environment, your professional liability insurance must be strong, stable, and reliable. You shouldn't have to worry about whether your company will still be here to protect you in the future.

For more than a decade, thousands of Maryland physicians have found the protection they need with Medical Mutual Liability Insurance Society of Maryland. A financially sound, conservatively managed specialty insurer, Medical Mutual is recognized as expert in the area of professional liability insurance.



Backed by a professional staff with years of experience in underwriting, claims handling, and risk management, our professional liability insurance provides strong, reliable protection—plus the expertise, service and attention that only a specialty insurer can offer.

We are proud to be serving thousands of your colleagues already, Maryland physicians who have found the right combination of protection, flexibility, and service for their practices. If you haven't met us yet, call your broker or call our Member Services Department at 1-800-492-0193.

Three financial reasons why practices choose the ACCLAIM™ Medical System

There are many compelling reasons to automate with the ACCLAIM Medical System. Here are three important benefits our customers have taken the time to write to us about:

1 Improved Cash Flow

"We have seen dramatic improvements in the efficiency of filing insurance claims and tracking accounts. We've also seen substantial improvement in our accounts receivable."

Susan Shaffer, Office Manager
Single Physician Practice

2 Increased Productivity

"The system is easy to use, straightforward in its commands and simplifies medical office management beyond belief."

Judy Greenburg, Office Manager
Four Physician Practice

3 Financial Control

"Sentient's ACCLAIM system has improved our collections by 100% and has provided reliable data on which to base practice management decisions."

Frank J. Mayo, M.D., Pulmonologist

Sentient Systems offers total solutions. Hardware (IBM® and compatible), software, installation, data conversion, training, support and service are a part of every system. We provide the highest quality medical system available today. Just ask our customers.

For a free consultation call Sentient at:

THE MEDICAL COMPUTING LEADER

A Choice.

Just what the doctors ordered.

What's right for a colleague is not necessarily right for you. That's why Princeton Insurance Company now offers three options to let you build an insurance program tailored to your individual needs:

o Our exclusive *Occurrence Plus* -- the best coverage available from any company.

o Our new *Claims Made Advantage* -- a cost effective way to make the transition to *Occurrence Plus*.

o *Claims Made* -- the lowest cost coverage available today.

The *Claims Made Advantage* and *Claims Made* options let you transfer from another insurer's claims made policy into Princeton's programs without a "tail" or "prior acts" charge.

To find out more about these choices, call one of the independent insurance agents who represent Princeton.

ARTICLES

Prevalence of Risk Behaviors and HIV Infection in Maryland STD Clinics 1019
Diane L. Matuszak MD, MPH; Indira Kotval MPH; Rekha Garg MD, MS; Jagdish Patel PhD, Ebenezer Israel MD, MPH; and David Glasser MD, MPH

Persons who are receiving evaluation and treatment for sexually transmitted diseases are at moderately increased risk for acquiring HIV infections. The scope of STD clinic services should be broadened to include counseling, education, and referral services for health needs related to risk of HIV infection.

Prehospital Providers' AIDS Knowledge and Attitudes 1027
Michael E. Thompson MS and James N. Eastham, Jr., ScD

Of the 110 career and volunteer prehospital care providers surveyed from two Maryland counties, about 20 percent were concerned about dealing with AIDS patients, including 24 percent who have considered leaving EMS due to the risk of HIV infection.

The Head-Injured Outpatient: Presentations and Rehabilitation 1035
Antoinette DeFazio PhD, Mark P. Kelly PhD, and James P.G. Flynn MD

Head injury, which annually affects 154 per 100,000 persons in Maryland, is a serious problem requiring attention from the medical community. The role of the general practitioner is viewed as central to the process of rehabilitation since this medical professional has a pre-existent relationship with the patient and the family.

Occurrence-Type Malpractice Coverage Is A Physician's Best Protection During Bad Times

Most physicians have in some way been affected by the last decade's volatile malpractice insurance market. Huge premium increases, restrictions on lateral changes from one insurer to another, and the ever-present threat of large "tail" costs forcing physicians to stay put, like it or not, are all part of recent malpractice insurance history.

Times are better now with malpractice insurers competing for your business. How long will it last? That is anyone's guess. Where is the best place to be insured when the pendulum swings the other way and prices rise again?

The answer is easy. All other things (policy terms, premiums and financial stability of the insurer) being equal, a physician's best protection against " bad times" is an occurrence-type policy. The reason is simple:

> With occurrence-type coverage, the company knows that the physician has complete mobility. If the company raises rates, the physician can leave to a less expensive insurer with no risk and no tail.
>
> With claims made coverage, the company can raise rates knowing that a physician will be reluctant to leave and incur a large tail cost.

Princeton Insurance Company provides the only occurrence - type policy offered in the State of Maryland. This competitively priced policy can be purchased without incurring a large up-front cost for prior acts coverage. The company is financially sound and insures over 500 Maryland physicians and 3 Maryland hospitals.

For a written quotation comparing Princeton's coverage to your policy, complete the form below and return it to us with a copy of the Declarations pages of your current policy. You need a broker you can rely on.

CONSENT FORM FOR DIPHTHERIA, TETANUS, AND PERTUSSIS
CONSENT FORM FOR MEASLES, MUMPS, AND RUBELLA

Physicians need to provide adequate information to patients (parents) prior to administration of DTP, DT, Td, and MMR vaccines. These Important Information Statements may be useful in providing facts to the patient and/or parent. (NOTE: Maryland law also requires a Pertussis Pamphlet be given to parents prior to administration of pertussis vaccine.)

IMPORTANT INFORMATION ABOUT DIPHTHERIA, TETANUS, AND PERTUSSIS AND DTP, DT, AND Td VACCINES

Please read this carefully **DTP 1/1/88**

WHAT IS DIPHTHERIA?

Diphtheria is a very serious disease which can affect people in different ways. It can cause an infection in the nose and throat which can interfere with breathing. It can also cause an infection of the skin. Sometimes it causes heart failure or paralysis. About 1 person out of every 10 who get diphtheria dies of it.

WHAT IS TETANUS?

Tetanus, or lockjaw, results when wounds are infected with tetanus bacteria, which are often found in dirt. The bacteria in the wound make a poison which causes the muscles of the body to go into spasm. In the United States, four out of every 10 persons who get tetanus die of it.

WHAT IS PERTUSSIS?

Pertussis, or whooping cough, causes severe spells of coughing which can interfere with eating, drinking, and breathing. In the United States, approximately 70 percent of reported pertussis cases occur in children younger than 5 years. Pertussis is a more serious disease in young children and more than half of the children less than 1 year of age reported to have pertussis are hospitalized. In recent years, over 2,000 cases of pertussis have been reported each year in the United States. Complications occur in a substantial proportion of reported cases. Pneumonia occurs in one of every four children with pertussis. For every 1,000 reported pertussis cases, 22 develop convulsions and/or have more severe problems of the brain. In recent years, an average of nine deaths due to pertussis occurred annually.

Before vaccines were developed, these three diseases were all very common and caused a large number of deaths each year in the United States. If children are not immunized, the risk of getting these diseases will go back up again.

DTP, DT, AND Td VACCINES:

Immunization with DTP vaccine is the best ways to prevent these diseases. DTP vaccine is actually three vaccines combined into one shot to make it easier to get protection. Advisory committees of the United States Public Health Service and the American Academy of Pediatrics recommend DTP vaccine be used in children up to their seventh birthday. The vaccine is given by injection starting early in infancy. At least three shots are needed to provide initial protection. Young children should get three doses in the first year of life and a fourth dose at about 15 months of age. A booster shot is important for children who are about to enter school and should be given between their fourth and seventh birthdays. The vaccine is very effective at preventing tetanus—over 95 percent of those who get the vaccine are protected if the recommended number of shots is given. Although the diphtheria and pertussis parts of the vaccine are not quite as effective, they still prevent most children from getting disease and they make the disease milder for those who do get it.

Because pertussis is not very common or severe in older children, those 7 years of age or older should take a vaccine that does not contain the pertussis part. Also, because reactions to the diphtheria part of the vaccine may be more common in older children, those 7 years of age and older should take a form of the vaccine that has a lower concentration of the diphtheria part. This vaccine which contains no pertussis part and a lower concentration of the diphtheria part is called Td vaccine. Boosters with the Td vaccine should be received every 10 years throughout life.

DEFERRAL OF DTP IMMUNIZATION:

Children who have had a serious reaction to previous DTP shots should not receive additional pertussis vaccine (see WARNING). A preparation called DT vaccine is available for them which does not contain the pertussis part. Also, children who have previously had a convulsion or are suspected to have a problem of the nervous system should not receive DTP vaccine until a full medical evaluation has been made.

POSSIBLE SIDE EFFECTS FROM THE VACCINE:

With DTP vaccine, most children will have a slight fever and be irritable within 2 days after getting the shot. One-half of children develop some soreness and swelling in the area where the shot was given. More serious side effects can occur.

(PLEASE READ OTHER SIDE)

A temperature of 105°F or greater may follow 1 out of 330 DTP shots. Continuous crying lasting 3 or more hours may occur after 1 in every 100 shots and unusual, high-pitched crying may occur after 1 in every 900 shots. Convulsions or episodes of limpness and paleness may each occur after 1 in every 1,750 shots. Rarely, about once in every 110,000 shots, other more severe problems of the brain may occur, and permanent brain damage may occur about once in every 310,000 shots. Side effects from DT or Td vaccine are not common and usually consist only of soreness and slight fever. As with any drug or vaccine, there is a rare possibility that allergic or more serious reactions or even death could occur.

Although some people have questioned whether DTP shots might cause Sudden Infant Death Syndrome (SIDS), the majority of evidence indicates that DTP shots do not cause SIDS.

PERSONAL OR FAMILY HISTORY OF CONVULSIONS:

Children who have had a convulsion and children who have a brother, sister, or parent who has ever had a convulsion are more likely to have a convulsion after receiving DTP vaccine. The advisory committees recommend that because of the overall risk of pertussis disease and the fact that the risk of convulsions is still very low: (1) children with a personal history of a convulsion and whose nervous system problem is stable may receive DTP vaccine; and (2) children with a family history of convulsions should receive DTP vaccine. However, you should tell the person who is to give the immunization about such a history and discuss the possibility of using an anti-fever medicine.

PREGNANCY:

Babies born under unsanitary conditions to unimmunized women have a risk of developing tetanus during the newborn period (neonatal tetanus). Neonatal tetanus can be prevented by immunization of adult women. Women who have not received Td earlier and who are thought to be at risk of delivering their babies under unsanitary conditions should be immunized during pregnancy.

Td vaccine is not known to cause special problems for pregnant women or their unborn babies. Doctors usually do not recommend giving any drugs or vaccines to pregnant women unless there is a specific need. Pregnant women who need Td vaccine should receive it, preferably during the second and/or third trimesters.

WARNING—SOME PERSONS SHOULD *NOT* TAKE THESE VACCINES WITHOUT CHECKING WITH A DOCTOR:

- Anyone who is sick right now with something more serious than a cold.
- Anyone who has had a convulsion or is suspected to have a problem of the nervous system.
- Anyone who has had a serious reaction to DTP, DT, or Td shots before, such as: an allergic reaction to any vaccine component; a temperature of 105°F or greater; an episode of limpness and paleness; prolonged continuous crying; an unusual, high-pitched cry; or a convulsion or other more severe problem of the brain.
- Anyone taking a drug or undergoing a treatment that lowers the body's resistance to infection, such as: cortisone, prednisone, certain anticancer drugs, or irradiation.
- Anyone who has had a serious reaction to a product containing thimerosal, a mercurial antiseptic.

QUESTIONS:

If you have any questions about diphtheria, tetanus, or pertussis or DTP, DT, or Td immunization, please ask us now or call your doctor or health department before you sign this form.

REACTIONS:

If the person who received the vaccine develops a temperature of 105°F or greater, continuous crying lasting 3 or more hours, an unusual high-pitched cry, a convulsion, an episode of limpness and paleness, or a severe problem of the brain, the person should be seen promptly by a doctor.

If the person who received the vaccine gets sick and visits a doctor, hospital, or clinic in the 4 weeks after immunization, please report it to:

PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

I have read or have had explained to me the information on this form about diphtheria, tetanus, and pertussis and DTP, DT and Td vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of the DTP, DT, and Td vaccine and request that the vaccine checked below be given to me or to the person named below for whom I am authorized to make this request.

IMPORTANT INFORMATION ABOUT MEASLES, MUMPS, AND RUBELLA AND MEASLES, MUMPS, AND RUBELLA VACCINES

Please Read This Carefully

MMR 1/1/88

WHAT IS MEASLES?

Measles is the most serious of the common childhood diseases. Usually it causes a rash, high fever, cough, runny nose, and watery eyes lasting 1 to 2 weeks. Sometimes it is more serious. It causes an ear infection or pneumonia in nearly 1 out of 10 children who get it. Approximately 1 child out of every 1,000 who get measles has an inflammation of the brain (encephalitis). This can lead to convulsions, deafness, or mental retardation. About 2 children in every 10,000 who get measles die from it. Measles can also cause a pregnant woman to have a miscarriage or give birth to a premature baby.

Before measles vaccine shots were available, there were hundreds of thousands of cases and hundreds of deaths each year. Nearly all children got measles by the time they were 15. Now, wide use of measles vaccine has nearly eliminated measles from the United States. However, if children are not vaccinated they have a high risk of getting measles, either now or later in life.

WHAT IS MUMPS?

Mumps is a common disease of children. Usually it causes fever, headache, and inflammation of the salivary glands, which causes the cheeks to swell. Sometimes it is more serious. It causes a mild inflammation of the coverings of the brain and spinal cord (meningitis) in about 1 child in every 10 who get it. More rarely, it can cause inflammation of the brain (encephalitis) which usually goes away without leaving permanent damage. Mumps can also cause deafness. About 1 out of every 4 adolescent or adult men who get mumps develops painful inflammation and swelling of the testicles. While this condition usually goes away, on rare occasions it may cause sterility. Before mumps vaccine shots were available, there were more than 150,000 cases each year. Now, because of the wide use of mumps vaccine, the number of cases of mumps is much lower. However, if children are not vaccinated, they have a high risk of getting mumps.

WHAT IS RUBELLA?

Rubella is also called German measles. It is a common disease of children and may also affect adults. Usually it is very mild and causes a slight fever, rash, and swelling of glands in the neck. The sickness lasts about 3 days. Sometimes, especially in adult women, there may be swelling and aching of the joints for a week or two. Very rarely, rubella can cause inflammation of the brain (encephalitis) or cause a temporary bleeding disorder (purpura).

The most serious problem with rubella is that if a pregnant woman gets this disease, there is a good change that she may have a miscarriage or that the baby will be born crippled, blind, or with other defects. The last big rubella epidemic in the United States was in 1964. Because of that epidemic, about 20,000 children were born with serious problems such as heart defects, deafness, blindness, or mental retardation because their mothers had rubella during the pregnancy.

Before rubella vaccine shots were available, rubella was so common that most children got the disease by the time they were 15. Now, because of the wide use of rubella vaccine, the number of cases of rubella is much lower. However, if children are not immunized, they have a high risk of getting rubella and possibly exposing a pregnant women to the disease. If an unimmunized woman later becomes pregnant and catches rubella, she may have a defective baby. Since rubella is a mild illness, many women of childbearing age do not recall if they had rubella as a child. A simple blood test can show whether a person is immune to rubella or is not protected against the disease. Overall, about 1 in 5 women of childbearing age is not protected against rubella.

MEASLES, MUMPS, AND RUBELLA VACCINES:

The vaccines are given by injection and are very effective. Ninety percent or more of people who get the shot will have protection, probably for life. Since protection is not as likely to occur if the vaccines are given very early in life, these vaccines should be given to children after their first birthday; measles-vaccine should be given at 15 months of age or older. Measles, mumps, and rubella vaccines can be given one at a time or in a combined vaccine

(PLEASE READ OTHER SIDE)

DHMH 2102

(measles-rubella [MR], measles-mumps-rubella [MMR] by a single shot. If they are given in combined vaccine, they should be given at 15 months of age or older.

Experts recommend that adolescents and adults—especially women of childbearing age—who are not known to be immune to rubella should receive rubella vaccine (or MMR if they might also be susceptible to measles or mumps). Women should not receive the shot if they are pregnant or might become pregnant within 3 months. There is no known risk in being immunized against any or all three of these diseases if you are already immune to any of them.

POSSIBLE SIDE EFFECTS FROM THE VACCINES:

About 1 out of every 5 children will get a rash or slight fever lasting for a few days, 1 or 2 weeks after getting measles vaccine. Occasionally there is mild swelling of the salivary glands after mumps vaccination.

About 1 out of every 7 children who get rubella vaccine will get a rash or some swelling of the glands of the neck 1 or 2 weeks after the shot. About 1 out of every 20 children who get rubella vaccine will have some aching or swelling of the joints. This may happen anywhere from 1-3 weeks after the shot. It usually lasts only 2 or 3 days. Adults are more likely to have these problems with their joints— as many as 4 in 10 may have them. True arthritis with swelling of the joints is generally seen in less than two percent of adults receiving rubella vaccine. If pain or swelling of the joints occurs, it rarely lasts for more than a few days and rarely returns. Other temporary side effects, such as pain, numbness, or tingling in the hands and feet have also occurred but are very uncommon.

Although experts are not sure, it seems that *very rarely* children who get these vaccines may have a more serious reaction, such as inflammation of the brain (encephalitis), convulsions with fever, or nerve deafness.

With any vaccine or drug, there is a possibility that allergic or other more serious reactions or even death could occur.

PERSONAL OR FAMILY HISTORY OF CONVULSIONS:

Children who have had a convulsion and children who have a brother, sister, or parent who has ever had a convulsion are more likely to have a convulsion after receiving measles vaccine. Advisory committees of the United States Public Health Service and the American Academy of Pediatrics recommend that because of the overall risk of measles disease and the fact that the risk of convulsions is still very low, children with a personal history of a convulsion and children with a family history of convulsions should receive measles vaccine. However, you should tell the person who is to give the immunization about such a history and discuss the possibility of using an anti-fever medicine.

WARNING—SOME PERSONS SHOULD NOT TAKE THESE VACCINES WITHOUT CHECKING WITH A DOCTOR:

- Anyone who is sick right now with something more serious than a cold.
- Anyone who had an allergic reaction to eating eggs so serious that it required medical treatment (does not apply to rubella vaccine).
- Anyone with cancer, leukemia, or lymphoma.
- Anyone with a disease that lowers the body's resistance to infection.
- Anyone taking a drug that lowers the body's resistance to infection (such as cortisone, prednisone or certain anticancer drugs).
- Anyone who has received gamma globulin (immune globulin) within the preceding 3 months.
- Anyone who had an allergic reaction to an antibiotic called neomycin so serious that it required medical treatment.

PREGNANCY:

Measles, mumps, and rubella vaccines are not known to cause special problems for pregnant women or their unborn babies. However, doctors usually avoid giving any drugs or vaccines to pregnant women unless there is a specific need. To be safe, pregnant women should not get these vaccines. A woman who gets any of these vaccines should wait 3 months before getting pregnant.

Immunizing a child whose mother is pregnant is not dangerous to the pregnancy.

QUESTIONS:

If you have any questions about measles, mumps, or rubella immunization, please ask us now or call your doctor or health department before you sign this form.

REACTIONS:

If the person who received the vaccine has a convulsion or other serious reaction the person should be seen promptly by a doctor.

If the person who received the vaccine gets sick and visits a doctor, hospital, or clinic in the 4 weeks after immunization, please report it to:

PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

Remembrances

Reading Margaret Smith's beautiful article* in the July 1989 *MMJ* brought back many fond memories, especially when she discussed the problems of infectious ("contagious") diseases during the 1920s, 30s, and 40s together with the origin and early beginnings of Sydenham Hospital for Contagious Diseases.

I graduated University of Maryland Medical School in 1925, and after my stint in University Hospital, I served a residency in Sydenham Hospital in 1927-1928. Dr. Myron G. Tull was superintendent of the hospital and also chief medical officer. I served and trained under him. I remember him as a very tall (6 feet 2 inches), lanky individual compared to my 5 feet 3 inches, a warm, compassionate, and a very capable and knowledgeable physician. Students from both Hopkins and Maryland were sent over as part of their teaching and training. As Smith relates, the clinical laboratory was up to date for that time. I performed some tests, such as CBCs, urines, and throat cultures, and assisted at autopsies.

Sydenham Hospital was a unit of the Baltimore City Health Department, and I believe Dr. Huntington Williams was Health Commissioner at that time. The hospital possessed its own ambulance to bring in critically contagious patients. I recall riding in our ambulance one day to the outpatient clinic of the old University Hospital, which was situated at the southwest corner of Lombard and Greene Streets diagonally across from Davidge Hall. (The old hospital was torn down in 1970 when the new hospital addition was built on Redwood-Baltimore-Greene Streets.) We removed a child from the clinic suffering from severe stridor, almost choking from a dipthteritic membrane occluding the posterior pharynx and larynx. On the way back to Sydenham in the ambulance, I intubated the child using an O'Dwyer clamp and tube. This clamp was shaped like a surgical scissors, which grabbed an O'-Dwyer tube (a black cylindrical plastic tube about one and one half inches in length) that slipped into the trachea. Thanks to G-d and O'Dwyer, the child immediately began to breathe with ease. At the hospital he received oxygen and an injection of diphtheria antitoxin. No antibiotics were in existence those days. Occasionally, a child "coughed his tube" and had to be re-intubated.

I vividly remember certain incidents that occurred during my tenure at Sydenham. One night after midnight, a child coughed up its tube and began to show immediate severe stridor. I was asleep in my room in the Administration Building, which connected to the hospital proper by an underground passageway. I ran in my pajamas to the hospital and reintubated the child.

I also recall a large cargo ship from India was anchored in Baltimore Harbor. They reported a very sick seaman aboard was suspected of having smallpox! A call from the Health Department to Sydenham requested a physician. I volunteered. A Baltimore City automobile was sent for me, and I was driven down to the Harbor and placed on a small motorboat that took me out to the large ship. I remember climbing up a rope ladder into the ship. I was escorted down to the hold of the vessel. The sick seaman presented a typical case of chickenpox (varicella), not smallpox (variola). We all might remember from our medical school days that the various lesions of smallpox all come out separately over the body, face, and flexor surface of the forearms, while with varicella one can observe all the lesions at one time and the lesions are not seen on the flexor surfaces. I relieved the Health Department of considerable anxiety.

I vividly remember the following incident: At that time the Mayor of Baltimore was Howard Jackson. He had slipped and severely sprained his ankle. He had been wanting to tour and inspect the nearly new Sydenham Hospital anyhow. He informed us that he was coming out the Hospital and at the same time could we examine and treat his sprained ankle. His Honor arrived with a considerable entourage. I had the signal honor to X-ray and splint the royal ankle. "Them were the days!"

I recall two cases with dire complications. One Saturday morning, after discharge rounds, a child who had recovered from diphtheria was ready for discharge. While awaiting to be discharged, he suffered a sudden death due to a complete cardiac arrest from the effects of diphtheria toxin, which was known to be cardiotoxic. It is a neurotoxic toxin similar to tetanus toxin. The second case was a child very ill from pertussis (whooping-cough, a very apt name). This poor child was suffering from persistent, protracted uncontrollable coughing followed by the typical whoop and usually vomiting. During one such episode the child suffered a cerebrovascular accident, evidently from bursting a small blood vessel in the brain. The child presented a picture of stroke almost similar to that in an adult.

Today, the old Sydenham Hospital has been replaced by Montebello Hospital, which is the rehabilitation facility associated with the University Hospital and also with the R Adams Cowley Shock Trauma Hospital.

SAMUEL SHIPLEY GLICK MD
Professor Emeritus, Department of Pediatrics

* The Changing Scene in Health Care Delivery. *MMJ* 1989;6:563-67.

Eight physicians and four medical office managers tell "all" about automation.

"Before we automated, our cash flow would stop for a month at a time. Now there's a more regular cash flow."

"We didn't add or subtract people. We just get more work done in the same amount of time."

"Now it takes just one hour to bill 3,000 accounts."

"If a patient didn't show up, I never knew it. Now, we can contact those who miss their appointments."

What can automation do for you?... What can't it do?... Is it practical?... What should you look for in a system?... What should you expect from the company who sells you the system?... How will it affect your staff?... And how do you go about getting the answers to all these questions?

KTI can help. As the systems supplier to over 3,000 healthcare professionals, we brought together a group of physicians and medical office managers to talk about the benefits and cautions of automation. And prepared a special report on their thoughts and comments.

If you want the advantage of their experiences, send us this coupon. And you'll get a lot of answers in just a few minutes of reading.

Fugitive Manuscripts

The cryptic note "old letters from Library shelves, Dr. Krause please check and destroy or suggest disposition" penned upon a heavy stuffed legal sized manila envelope piqued my curiosity. Located under a group of library committee reports from the 1950s and 60s this was the type of find that makes being a rare book librarian or archivist exciting. What could these "old letters" be? What would they tell us about the Faculty's history and the men and women who made it?

I anxiously, but carefully, opened the envelope to find a variety of authors and dates, some contemporary with the reports in the envelope and others dating back to the early days of the Faculty. Some were routine correspondence: a thank-you note from Marcia Noyes for additional copies of the 1888 *Index Medicus* or a postcard indicating a physician was not going to attend a Faculty meeting; others, a bit more interesting, make up the following sampling.

■ ■ ■

Committing a family member to an asylum in the nineteenth century was, as it is today, a difficult decision. It wasn't uncommon to invite several area physicians to review a particular case before a decision was made. It would seem from the letter below that was the case here. Preston in his comments refers to himself as one of the patient's physicians, suggesting that others also were in attendance.

> *1840*
> *I do hereby certify that I attended William H. McCloskey(?) as one of his Physicians & that there was no doubt upon the minds of any of his medical advisors as to his Insanity - at time he was a complete madman - this case* [a section of the letter is missing here] *easily ascertained by talking a few minutes with him upon the subject of Religion.*
>
> *JACOB A. PRESTON MD*

Dr. Preston's account leaves us wondering whether his patient was truly "mad" or just a bit tense regarding religion and what about "religion" Preston and his patient discussed.

■ ■ ■

Very few of the early minute books and treasurer's reports of the Faculty have survived to the present day. So finding a complete report with notes in this envelope is of immense benefit to the Faculty.

> *The Treasurer of the Medical and Chirurgical Faculty of Maryland submits his act.* [account] *Book and his annual report, showing the receipts and expenditures of the faculty for the past year; by which it will be seen that since meeting in June last his receipts have amounted to $295.40 and the disbursements for the same period $295.40 leaving a balance due the Library from the appropriation of last year for the sum of $225.50.*
>
> *He asks for the usual committee to access his act. - all of which is faithfully submitted.*
>
> *Joshua I. Cohen MD*
> *Treasurer*

Cohen's notes and figures would lead us to believe that the Faculty was barely breaking even during the early years. The letter suggests that an effort to make up an earlier shortfall was made by borrowing against the Library accounts but that the amount was still owed at the close of 1843.

■ ■ ■

In the early 1880s Editor and Co-Founder of the *Maryland Medical Journal* Eugene Cordell must have been doing some soul searching regarding the status of the *Journal*. Like so many projects a good deal of support was given to the idea of the *Journal* but when the time came to actually produce it, much of the work fell upon Cordell. A letter from Robert Bartholow, of Pennsylvania, seems an attempt to cheer Cordell on:

> *I am so thoroughly convinced of your faithfulness and honest work in your attempt to give the profession of Baltimore a suitable medical organ, that I feel bound to help you in my humble way. I say this, my dear Doctor, not in the ordinary conventional manner - for I am not given to empty compliments - but because I really feel it.*

A few years later and only a short time prior to his being elected President of the Faculty, Cordell must have still been feeling some concern about his *Journal* efforts and his role in the Faculty as well, or perhaps he was only seeking a career change. Whatever the motivation, in February 1899 Cordell sent a letter to Washington seeking an appointment in the Foreign Consular Service. He promptly received a form letter in return telling him that appointments were strictly

"political," a particularly amusing response from the Senate in light of recent concerns regarding the quality and method of appointments to the foreign service.

Replying to your letter of yesterday. I have to inform you that appointments in the consular service are made by the President. It is necessary to file an application with the Secretary of State and pass a certain kind of an examination; but nothing but political influence in accord with the Administration will obtain you an appointment.

■ ■ ■

In 1895 the Faculty's president, J. Edwin Michael, died after only a few short months in office. A special meeting was held to honor Michael's medical achievements and many Faculty members spoke. One of the more eloquent acknowledgments came from Dr. John H. Jamar who was unable to attend but whose letter was stashed in this batch of "fugitive manuscripts."

My Dear Doctor,

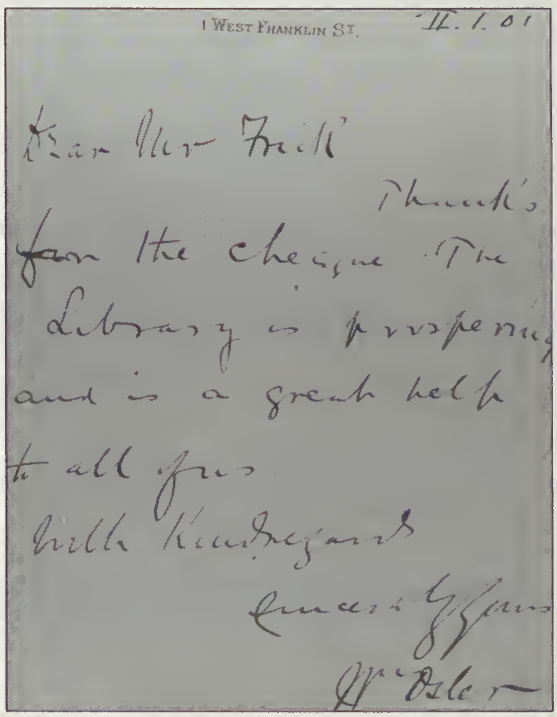
I regret I shall not be able to be with you tomorrow at your meeting to give expression to our sense of loss at the falling off of one of the bright lights in the medical firmament - I had the pleasure of knowing our generous brother and had learned to look upon him as a genial friend and a much beloved member of the fraternity - and I can scarcely realize the fact that he has been removed from us before he had hardly obtained the wisdom of life. The Faculty has lost one of its faithful servants and the profession one of its most active and promising members.

I am faithfully yours,
John H. Jamar

■ ■ ■

As indicated a great number of the letters were short notes of one type or another. One of my favorites, in terms of brevity and content, is a cryptic letter typed (with a signature) in 1906 from the office of Dr. William Sydney Thayer. It reads simply,

Dear Magruder:...
Love has come into the fold. Here's to Love!
Yours Sincerely,
W.S. Thayer



■ ■ ■

Last, but by no means least, is a short thank you note from Sir William Osler to Frank Frick for his continued support of the "Frick Library." While unremarkable in terms of information this note serves to remind us of degree to which Osler was active in promoting the Faculty Library and of the great stock he set by it. In addition, the note is graced by a very clear signature.

Dear Mr. Frick

Thanks for the checque. The Library is prospering well and is a great help to all of us.
With kind regards,

Sincerely Yours
Wm. Osler

■ ■ ■

Historical information about the Faculty and it's members continues to turn up as the business archives and personal papers - long neglected - are sorted and made available to researchers. With time, and the Faculty's continued support of the Library's efforts, I hope to bring more of this type of material to the membership's attention.

BILL SLEEMAN
Med Chi Archivist ■

Announcing a cure for the common computer.

Is your practice computer system chronically ill? Or perhaps you're just not getting access to the information you need? At MEDSOURCE, we have the expertise to diagnose and treat your data problems. Whether it's analyzing data for negotiation with HMOs, coordinating clinical research projects or tracking patient care, MEDSOURCE can provide you with healthy, accurate data every time.

We can assist you in the selection of medical record and accounting systems. We'll install new equipment and train your staff. We can even develop customized programs to help you make new use of existing data.

MEDSOURCE's 13 years of experience in computer programming and our in-depth knowledge of the clinical health care field make us the expert in computer systems for practice management. So, the next time you find yourself diagnosing your computer instead of your patients, call MEDSOURCE.

Medicare Elective Surgery Provisions

Participating physicians are reminded that if they are performing elective survey for which they will charge $500 or more and they **do not intend to accept Medicare Assignment**, the patient must be given a written disclosure of the physician's estimated actual charge. The difference between the physician's charge and the Medicare charge represents the patient's liability. Physicians who fall into this group are being randomly sampled, and copies of such correspondence to the patient are being requested by Medicare. **Failure to produce such correspondence will result in a beneficiary inquiry.** For more information or a sample letter for this purpose, contact Betty J. Stewart in the Utilization Review Department for BC\BS at 1946 Greenspring Drive, Timonium, MD 21093.

New Med Chi Physicians' Credentialing-Service

Med Chi recently established a centralized physicians' credentialing records program. The Faculty will serve as a clearinghouse for documents required for physician hospital appointment under Maryland's licensure law and by JCAHO standards. Subscribing physicians' files will be verified automatically and updated to support Maryland requirements for physician hospital reappointment every two years. Participating hospitals will receive a certified copy of each staff physician's file so that the medical staff may review the data before making a recommendation for appointment or reappointment. For more information regarding the physician's credentialing service, contact Joseph Jensen, Director of Med Chi Support Services, at 1-800-492-1056 or 301- 539-0872 in Baltimore.

Med Chi Directory Disclaimer

Specialty designations listed in the *Membership Directory* are reported by individual physician members who are responsible for their accuracy. The listing of a specialty designation by a physician in the *Membership Directory* does not mean that the State Physician Quality Assurance Board or individual Specialty Certification Boards have given approval or endorsement of the particular physician's specialty designation.

Membership Directory Corrections

Med Chi physicians are advised to make note of a few corrections in the 1989-1990 Membership Directory. The American Psychiatric Association (516) was omitted from the Specialty Codes list. The American Board of Internal Medicine (020) was omitted from the Specialty Board list. The following physicians were omitted from the index of names:
Zucker, Jonathan E., Prince George's County; Zullo, Leonard M., Baltimore County; Zuniga, Luis M., Howard County; Zurowski, Wayne K., Calvert County.

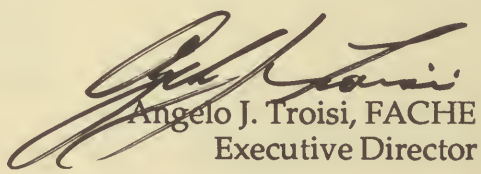
Medical Assistance Providers

The Maryland Medical Assistance is requesting that physicians sign a standard service agreement with the program. The agreement is automatically renewable thereby eliminating the annual update of physician enrollment status. It also precludes the previous requirement that a physician must sign each claim submitted to the Medical Assistance Program. Physicians signing the service agreement maintain the freedom of choice to render services to Medical Assistance beneficiaries. This is in keeping with Med Chi's support of legislation to reduce Medicaid red tape and to encourage private practicing physician to participate in the Medical Assistance Program.

1990 Annual Meeting

Med Chi's 1990 Annual Meeting will be held on May 9-11 at the Turf Valley Hotel and Country Club in Ellicott City, MD. "The 1990s: What Can We Expect?" is the theme for this meeting that will feature Lonnie R. Bristow MD, Member of the AMA Board of Trustees as the plenary speaker.

New Peer Review Manual



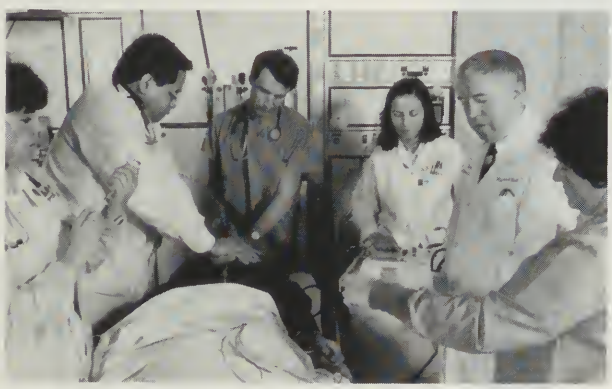
The Med Chi Council approved a new peer review manual on October 25, 1989. This manual, prepared through the cooperation of Med Chi's Peer Review Committee, Component Societies, and the Board of Physician Quality Assurance (BPQA) and has become a national model for use in other states. Med Chi thanks Christopher Harvey MD, Chairman of the Peer Review Management Committee; Emidio Bianco MD, former Peer Review Committee Chairman; Peter Dans MD, of BPQA; and all physician members, component societies who helped make this manual possible.

New Faculty Position Papers

On October 25, 1989 Med Chi Council adopted a new Faculty Position on Cholesterol Testing and also amended the Faculty Position on AIDS. These papers will appear in the legislative issue of the *Maryland Medical Journal* in January. For a copy of the Faculty's Position Papers contact Med Chi's Communications Department at 1-800-492-1056 or 301-539-0872 in Baltimore.

New Staff Attorney

Med Chi's new staff attorney, Greg Hall was recently hired by Rifkin, Evans, Silver, and Lamone to provide on-site legal services for Med Chi. Mr. Hall is a graduate of the University of Arkansas School of law and obtained a master's degree in health law from Loyola University of Chicago School of Law, a degree possessed by only about 25 attorneys in the country. In addition to being a licensed pharmacist, Mr. Hall is knowledgeable in areas such as Medicare and Medicaid requirements, state medical record requirements, and laws governing licensure and operation of health facilities.



Angelo J. Troisi, FACHE
Executive Director

Will the Real Heart Attack Risk Factor Please Stand Up?

Ignoring chest pain prevents pre-heart attack treatment that can save life.

Early signs of an impending heart attack are usually not recognized in a crowd and they go unnoticed and undetected. Heart attacks remain the number one killer of the adult population because most Americans enter the hospital system when they are "crashing" with either heart damage or heart arrest . . . too bad.

Chest Pain Emergency Center at St. Agnes Hospital

Heart attacks have beginnings which are often ignored. Denial and delay take place because the symptoms are minimal and the pace of life seems too important to take the time to check them out . . . too bad; for it is here that the heart muscle is still viable and healthy.

Recognition and response can take place only if the individual or first responder (Early Cardiac Care Giver) pays more attention to these early warning signs and acts to check them out. . . . Be safe rather than sorry.

Central Chest Discomfort
Coming and Going
Coming and Going
Get it Checked Out
Get it Checked Out
Life's Too Darn Important
Stand Up and be Counted
for Tomorrow.

Prevalence of Risk Behaviors and HIV Infection in Maryland STD Clinics

Diane L. Matuszak MD, MPH; Indira Kotval MPH; Rekha Garg MD, MS; Jagdish Patel PhD, Ebenezer Israel MD, MPH; and David Glasser MD, MPH

Authors Matuszak, Kotval, Patel, and Israel are with the Maryland Department of Health and Mental Hygiene; Dr. Garg at the time of the study was at the University of Maryland School of Medicine, Department of Epidemiology and Preventive Medicine; and Dr. Glasser is with the Baltimore City Health Department. **Reprints:** *Diane L. Matuszak MD, Chief, Center for Comunity Epidemiology, DHMH, 201 W. Preston St., Baltimore, MD 21201.*

Persons who are receiving evaluation and treatment for sexually transmitted diseases are at moderately increased risk for acquiring HIV infections. The scope of STD clinic services should be broadened to include counseling, education, and referral services for health needs related to risk of HIV infection.

Since the licensure of test kits to detect antibody to human immunodeficiency virus (HIV) in 1985, information has been rapidly accumulating on the prevalence of HIV antibodies in persons known to be at high risk of acquired immune deficiency syndrome (AIDS) and HIV infection.[1] Two-stage serological testing with an enzyme linked immunosorbent assay (ELISA) followed by Western blot testing of repeatedly positive sera has proved to be highly sensitive and specific[2] and has gained wide acceptance.

Infection rates have been reported for groups of homosexual and bisexual men,[3,4] intravenous drug abusers,[5,6,7] hemophiliacs,[8] and others who perceive themselves to be at high risk such as attendees at public counseling and testing sites. Reports also have been published on HIV seroprevalence rates in large population groups at very low risk due to prior exclusion of persons with high-risk behavior patterns such as blood donors[9] and military recruits.[10,11]

Sexual transmission of HIV, from male to male,[12] male to female,[13,14] and female to male,[14-16] has been documented. In Africa and Haiti, heterosexual transmission appears to be the predominant mode of transmission.[17,18]

Sexually transmitted diseases (STD) causing ulcerations or breaks in the epithelium have been implicated in facilitating sexual transmission.[19-22]

Maryland, both in Baltimore City and in other jurisdictions, has had high prevalence rates for gonococcal infections and for early syphilis in recent years. In 1987, Maryland ranked seventh among states, and Baltimore ranked fourth among major cities for gonococcal infections with rates per 100,000 of 477.1 and 1,643.7 respectively. Maryland's rate for primary and secondary syphilis, 11.0 per 100,000 placed it at sixteenth, and Baltimore's rate of 47.0 per 100,000[23] placed it in eleventh position in the syphilis rankings. By February 1987, more than 500 cases of AIDS had been reported in

Maryland with more than 40 percent of these cases coming from Baltimore City.[24]

In February 1987, a blind seroprevalence/ anonymous risk factor questionnaire study was undertaken in Maryland with a primary objective of determining the prevalence of antibodies to HIV in a population at moderately increased risk.

Methods

The basic methodolgy of linking anonymous questionnaires and blinded serologic specimens was developed by the Maryland Department of Health and Mental Hygiene (MDHMH) and the Baltimore City Health Department and was utilized for concurrent serosurveys by these agencies. The Baltimore City Health Department serosurvey results have been reported.[25]

The STD clinics in the local health departments of each jurisdiction in Maryland (23 counties and Baltimore City) were invited to participate in a blind seroprevalence survey for antibodies to HIV during the period March to September 1987. Each clinic was asked to participate for a three-month period. The starting dates were staggered to more evenly distribute the volume of tests over the range of the survey's duration. Only one jurisdiction, a rural county that had been expected to contribute less than 4 percent of the sample, declined to participate.

For purposes of analysis, Maryland was divided into six regions. The Eastern Shore, Western Maryland, and Southern Maryland are largely rural and more geographically distant from urban centers. The areas suburban to Baltimore and Washington, DC geographically cover the central portion of the state. Baltimore City lies in the center of state at the head of the Chesapeake Bay.

An estimated number of individuals seeking services at each clinic during a three-month period was calculated using data supplied on clinic services the previous year. Each clinic was provided with a three-month supply of a specially printed laboratory request form for serologic tests for syphilis (STS). This STS request form consisted of 4 parts: (1) an anonymous questionnaire, (2) a self-sealing envelope, (3) a copy of the standard STS request form, and (4) a blind copy of the standard STS form containing no patient identifying information.

An STS is routinely drawn at each clinic visit unless the patient has had this test done within the previous 30 days or refuses testing. A 12 question self-administered questionnaire was developed. The reading level of the questionnaire was adjusted to fourth to sixth grade. The comprehensibility of the questionnaire was field tested prior to use in this survey. Each STD clinic attendee who had a blood specimen drawn for STS was asked to voluntarily and anonymously complete a questionnaire, seal it in the envelope, and deposit it in a locked "mail" box. Attendees were asked to follow this procedure even if they did not wish to answer any of the questions to assure that there would be a questionnaire for each attendee regardless of response rate.

A two-step blinding procedure was employed: a unique code number was placed on each questionnaire and the corresponding blind copy of the STS request form using either a dot matrix or invisible ink. In this manner, anonymous responses were linked to the blind copy of the STS request.

The blind copy of the STS request was linked to a blinded aliquot of serum in the following manner. The regional and central serology laboratories were provided with matched pairs of prenumbered labels. The aliquots to be sent for HIV antibody testing were submitted to the central retrovirology laboratory labeled only with a specimen code number. The matching label was placed on the top of the blind copy of the STS request form, which was sent directly to the survey coordinator at MDHMH. Anonymous questionnaires were collected at the STD clinics and forwarded to the survey coordinator in their original sealed envelopes. Data from the questionnaires, the STS request forms, and HIV antibody test results were entered as three separate database files and then merged into a single master file.

The syphilis serology laboratories in all regional laboratories and the central laboratory received instructions in the sampling procedure and the sampling fraction (one in three specimens in urban/suburban areas; one in two specimens in rural areas where clinic attendance is sparser).

The Baltimore City portion of the Maryland survey represents a one in three sample of the first 3,000 STD clinic attendees in the population on which data were previously reported.[25] These duplicate aliquots of serum were independently tested in the retrovirology laboratory, MDHMH, to assure that the sensitivity and specificity of HIV antibody tests were identical for the Baltimore City tests reported here and those from the remainder of the state.

During the same period over which the serosurvey was conducted, a separate knowledge, attitude, and behavior (KAB) interview survey was conducted at the same sites with a sample size at each site targeted at 10 percent of the serosurvey sample size. Specially trained interveiwers approached attendees while they were waiting to be seen and invited them to volunteer to be interviewed. The purpose of the interview and the assurance of the anonymity of responses were explained to prospective volunteers. Each interview lasted 30 to 45 minutes. Interviews were not linked to anonymous self-completed questionnaires, but interviewees were drawn from the same clinic population. A total of 321 STD clinic attendees were interviewed.

During the survey period, HIV antibody testing and counseling was available to all STD clinic attendees in the local jurisdictions. Written policies in effect at the time of the serosurvey required that all STD patients receive information about AIDS and prevention of HIV transmission, and be offered voluntary HIV antibody testing.

The instruments and protocols for the serosurvey and the KAB interviews were approved by the MDHMH Institutional Review Board.

Laboratory methods A commercially available ELISA kit manufactured by Electro Nucleonics, Inc. (Columbia, MD) was used to screen all sera for antibodies to HIV. All sera were screened in duplicate with the ELISA test. Specimens reactive on one or both tests were then tested by the Western blot method using reagents manufactured by Protatek International, Inc. (St. Paul, MN). Only specimens reactive on both ELISA tests and with viral protein bands at both p24 and gp41 were considered positive.[26]

The rapid plasma reagin (RPR) card test was used as the screening serological test for syphilis. Positive RPR results were confirmed using the fluorescent treponemal antibody absorption test.

Statistical analysis Demographic characteristics and test results were statistically compared using the Statistical Analysis System software package (Cary, NC) on an IBM 4341 Mainframe Computer. Chi-square analysis and Fisher's exact test were used to compare risk behaviors, demographic information, and serological test results between groups. Multiple logistic regression was used to identify demographic, behavioral, historical, and laboratory variables having a significant independent association with the pre-sence of antibodies to HIV.

Results

A total of 8,445 questionnaires were returned from STD clinics. HIV antibody testing was performed on a disproportional stratified systematic sample of 2,887 (34.2 percent) sera. Of the 2,887 linked questionnaires, no questions were completed on 683 (23.6 percent). Of the remaining 2,204, 269 (12.2 percent) had at least one question unanswered and 1,935 (87.8 percent) had all items completed. The overall seroprevalence for those with complete questionnaires (1,935) was 46 confirmed positives for a rate of 2.4 percent. Ten of 269 (3.7 percent) specimens with incomplete questionnaires were seropositive, and 10/683 (1.5 percent) of those with blank questionnaires were seropositive. These differences were not statistically significant ($p = 0.20$ and $p = 0.16$ respectively).

Table 1 presents the comparison of the demographic and risk- behavior information from (a) the questionnaires associated with the specimens included in the serosurvey, (b) the remaining questionnaires associated with specimens not selected for HIV antibody testing, and (c) the KAB interviews.

The only statistically significant differences between the serosurvey questionnaires and the KAB interviews were that men were slightly underrepresented in the interview group and that the interviews were more successful in eliciting a history of bisexual behavior.

The serosurvey questionnaires corresponded well to the nonserosurvey questionnaires. The only statistically significant difference was in the percent of the population that was nonwhite. This result could be anticipated due to the one-in-three sampling fraction used for Baltimore City where STD clinic attendees were overwhelmingly nonwhite (95 percent compared to 63 percent elsewhere in Maryland). When examined on a region-by-region basis, the only region with a statistically significant underrepresentation of nonwhites was the suburban Washington, DC area (70.7 percent versus 79.7 percent, $p < 0.01$).

Table 1. Demographic and Risk Behavior Comparisons

Demographic Characteristic	Serosurvey Questionnaires	Nonserosurvey Questionnaires	KAB Interviews
Analyzable number *	2,204	4,917	321
Age			
Mean (years)	24.6	24.8	24.4
Range	(12-74)	(12-76)	(14-64)
Male	62.7%	62.1%	56.4%†
Nonwhite	75.4%	80.2%‡	73.5%
Reporting parenteral drug use since 1978	6.8%	5.9%	4.7%
Number males	1,381	3,055	181
Bisexual	13.7%	3.0%	6.6%†
Homosexual	2.3%	1.7%	2.2%
Not answering questions on male-to-male sex	10.2%	9.5%	---

* Includes all questionnaires for which these particular items were complete.

† The difference between the serosurvey and KAB interviews is statistically significant, $p < 0.03$.

‡ The difference between the serosurvey and nonserosurvey questionnaires is statistically significant, $p < 0.01$.

Univariate Analysis

Table 2 details the results of univariate analysis for the entire serosurvey population. Men were much more likely to be seropositive than were women. Although the overall seropositivity rate in nonwhites was nearly twice as high as the rate for whites (95 percent CI 0.8, 4.2), this difference was not statistically significant.

For both sexes, a history of parenteral drug use in the respondent or in a sex partner of the respondent was associated with an increased risk of HIV infection. There was a strong association with serologic and/or historic evidence of syphilis. The only STD showing no statistically significant association with serologic evidence of HIV infection in this population was a history of herpes, but even in this case the odds ratio was 2.3 with 95 percent CI 0.8, 6.5 ($p > 0.08$). There was no increased risk associated with a history of blood transfusion since 1978.

With regard to high-risk behavior patterns, there was no statistically significant difference in HIV seropositivity rates in men who responded negatively to questions about same-sex activities since 1978 and men who failed to respond to the same questions. Men who responded affirmatively to these questions showed a markedly higher rate of positive HIV an-

tibody tests. There was no association of seropositivity with history of sex with a prostitute. Since relatively few women (17) reported that their sex partner was bisexual, risks attributable to this factor could not be determined.

For men, there was a trend for increasing rates of seropositivity with increasing age through the fifth decade (Figure 1). For women, the trend appears to be similar but, because of the very low number (5) of seropositives, detailed analysis was not feasible.

Geographic and Racial Differences

Examining the seropositivity rates by type of region, we found 3/427 (0.7 percent) specimens from three rural regions were positive, 18/1460 (1.2 percent) of specimens from two suburban regions were positive, and 45/979 (4.6 percent) of the specimens from Baltimore City were positive. Since difference between rural and suburban regions was not statistically significant, data from all regions outside Baltimore City were therefore pooled for further comparisons.

The demographic characteristics of the population attending STD clinics in Baltimore City are significantly different from those of the population attending STD clinics elsewhere in the state (Table 3). The Baltimore City clinics provide STD services to a younger, more often male, and overwhelmingly nonwhite group that is also more likely to have a history of past STD, especially venereal warts (69.5 percent). The proportions of male attendees admitting to sexual activity with another male since 1978 and the proportions of all attendees admitting parenteral drug use or having had a sex partner who used drugs parenterally are essentially the same for urban and suburban/rural areas.

In the Baltimore City serosurvey, black STD clinic attendees were found to be statistically more likely to be seropositive than white attendees (5.0 vs 1.2 percent, $p < 0.02$).[25] This difference was not found among

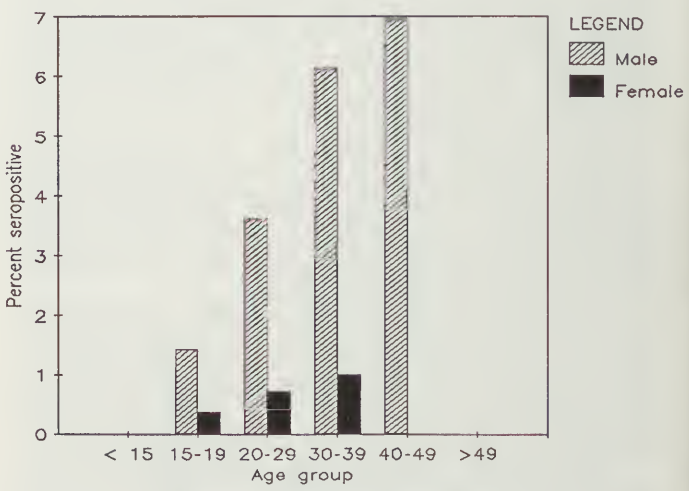

Figure 1. Serostatus by Age Group

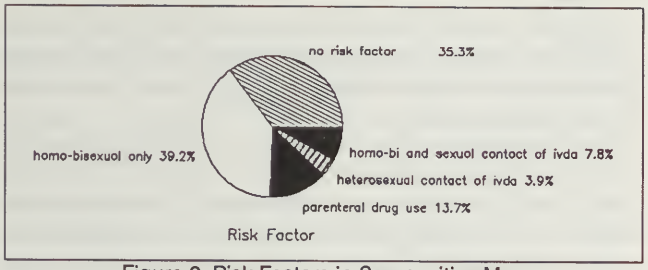

Figure 2. Risk Factors in Seropositive Men

black and white attendess in areas outside of Baltimore City (1.2 vs 1.5 percent, $p = 0.63$). In areas outside Baltimore City, black STD clinic attendees were more likely than white attendees to report a history of syphilis, (7.2 percent vs 2.4 percent, $p < 0.001$) or gonorrhea (48.1 percent vs 24.6 percent, $p < 0.001$), while white attendees were more likely to report parenteral drug use in themselves (11 percent vs 3.3 percent, $p < 0.001$) or sexual partners (15.6 percent vs 6.8 percent, $p < 0.001$). There was no statistically significant racial difference in the reported frequency of male-to-male sexual activity since 1978.

Baltimore City and nonurban STD clinic attendees were compared stratified by race. When comparing urban and suburban/rural groups, urban attendees were more likely to have reactive serological tests for syphilis and to report a history of venereal warts regardless of race. The data for white attendees showed that urban attendees were older than their nonurban counterparts. The data must be interpreted with caution because of the small number of white attendees in Baltimore.

There were several statistically significant differences by clinic location among black attendees. Urban black attendees were more likely to be male, to have a history of syphilis, and to report intravenous drug use in self or sex partner and were more likely to be seropositive than their nonurban counterparts (4.2 vs 1.2 percent, $p < 0.001$).

Risk Factors in Seropositives

Sex and risk-factor information was not reported for 10 of the 66 seropositives. Only 1 of the 5 female seropositives responded affirmatively to any question on recognized risk factors. That woman reported parenteral drug use since 1978. Figure 2 is a pie chart of risk factors in 51 seropositive males. More than a third (18) of the seropositive men failed to report a recognized risk factor. Six of these men (11.8 percent of the seropositive men) did not respond to any of the risk factor questions. Two (3.9 percent) seropositive men had reported heterosexual contact with a parenteral drug user as their only risk factor. Nearly half the seropositive men (24 of 51) reported male-to-male sexual activity, and 13.7 percent were parenteral drug users.

Figure 3 A and B depicts serostatus by number of male and female sex partners reported for the previous 30 days by male respondents. Since exclusively homosexual men have had zero female sex partners in the last 30 days, higher rates were seen in this group than in men who reported one or more female partners in the past 30 days. Taking this into account, it appears there may be a trend toward increasing seroprevalence rates with increasing numbers of partners of either sex. Because of the small numbers of respondents reporting more than four partners in the past 30 days, this impression may not be accurate. The only difference in rates reaching statistical significance is that between zero partners and at least one partner of either sex.

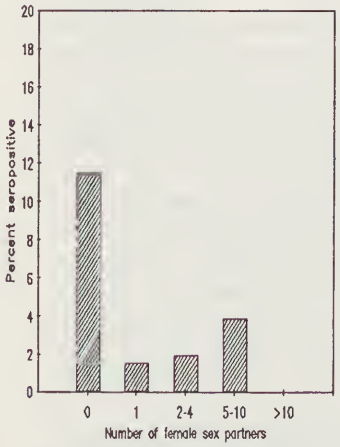

Figure 3A. Serostatus in Men by Number of Female Sex Partners in Past 30 Days

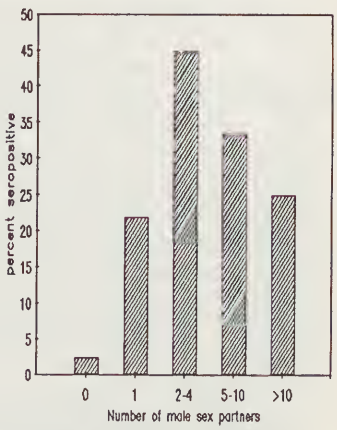

Figure 3A. Serostatus in Men by Number of Male Sex Partners in Past 30 Days

Multiple Logistic Regression Analysis

The serosurvey data were tested using multiple logistic regression analysis to detect variables independently associated with an increased risk of HIV infection. Female respondents were omitted from the analysis because of the very low number of female seropositives (N =5). Table 4 presents the variables found to be independently associated with increased risk of HIV infection for male respondents. The number of male sex partners in the past 30 days was directly associated with risk of HIV infection, while the number of female sex partners in the past 30 days was inversely associated. Serologic evidence of syphilis (a reactive RPR) markedly increased the risk of HIV infection, while a history of venereal warts moderately increased the risk. A history of gonorrhea, herpes, or hepatitis B failed to show an independent association. Race and age did not show statistically significant associations.

Analysis was then performed controlling for male-to-male sexual activity. With men who admitted sexual contact with another male eliminated from the analysis, parenteral drug use since 1978 again shows a significant association with risk of HIV infection (Beta = 0.9985, $p < 0.001$, OR 2.7, 95 percent, CI 1.5, 4.8).

Discussion

Partial demographic information was available on more than 75 percent of the serosurvey, and complete demographic and behavioral risk factor data were available on more than 66.6 percent (1,935/2,887). There were minimal differences between anonymous questionaires and personal interviews on a sample from the same population. Two-stage matching procedures allowed linkage of questionaire and serologic test data without jeopardizing anonymity. There was no evidence that the STD clinic attendees who failed to complete questionnaires were at increased risk of HIV infection. Male respondents who failed to answer questions on same-sex activities had essentially the same risk of HIV infection as male respondents reporting no same-sex activities since 1978. Individual KAB interviews failed in detecting a higher prevalence of most risk behaviors.

Race	0.4368	.40*	1.5	(0.6, 4.3)

* Not significant

Our data suggest that attendees at STD clinics are at moderately increased risk of HIV infection. While the rate of HIV infection was significantly higher in Baltimore City STD clinics, the risk of HIV infection for those attending STD clinics exists throughout the state, even in essentially rural areas. The overall seropositivity rate for heterosexual men (22/1,095, 2 percent) was higher than that reported for heteroxexual men in New Mexico (6/786, 0.76 percent)[27] and lower than the 3.4 percent reported in 295 heterosexual men studied in New York City STD clinics.[28] The overall seropositivity for women (5/820, 0.6 percent) showed a similar pattern being greater than New Mexico (0/476, 0 percent), and comparable to San Francisco STD clinic data (2/299, 0.67 percent).[29]

Similar to the experience in New Mexico, we found no significant increased risk in nonwhite clinic attendees in areas outside of Baltimore City. This contrasts to the significant racial differences in risk of HIV infection reported in Baltimore City STD clinics. The racial differences noted in Baltimore City may be attributable to the increased prevalence of syphilis, venereal warts, and intravenous drug use in black attendees at those clinics compared to the prevalence of these same risk factors in the black attendees at clinics elsewhere in Maryland. Urban black attendees were more likely to report a history of parenteral drug use in a sexual partner than nonurban attendees. There were no intrastate geographic differences in the prevalence of the high-risk behavior pattern of male-to-male sexual activity regardless of race.

The data on white attendees in Baltimore City may be very misleading because the overall number of white attendees is very low. This apparent underrepresentation of white STD clients in these clinics may be due to high-risk white persons within Baltimore City seeking evaluation and treatment for suspected STD at sites other than the Health Department, such as the Gay STD clinic, the national cohort study of Gay men, and university teaching hospitals. Similar resources are not as easily available to persons who reside in nonurban areas who suspect that they have STD and/or HIV infection.

The lack of racial differences in rates of HIV infection in the nonurban portion of this population lends support to the conclusion that behavior patterns and risk of STD, rather than race alone, influence the risk of acquiring HIV infection. The overall rates of STD and intravenous drug abuse are higher in nonwhite populations in Maryland (unpublished data, Maryland Division of STD Control) and elsewhere.[30-32] These factors play an important role in the assessment of risk of HIV infection.

In addition to the recognized high-risk behaviors of male-to-male sexual activity and parenteral drug use,

both syphilis and a history of venereal warts were independently associated with increased risk of HIV infection. These findings are consistent with previous published reports.[19-21,25] The current increases in incidence of primary and secondry syphilis being reported in Maryland and across the nation[33] become a more ominous threat when seen in this context. Control of STD, especially infectious syphilis, becomes an essential component of the control and prevention of HIV infections.

In view of the high correlation of HIV infection with serological evidence of syphilis, MDHMH has recommended that all patients with syphilis be encouraged to have HIV counseling and testing. Counseling and testing for antibodies to HIV with informed consent is routinely offered to all attendees at public STD clinics in Maryland.

The overall seropositivity rate for gay/bisexual men in this study (23/79, 29.1 percent) was higher than the rate for gay/bisexual men at Maryland counseling and testing sites in 1985 and 1986 (261/1,358, 19.2 percent). Gay/bisexual men have been reluctant to receive counseling and testing even though, at the time of the survey, 91 percent of the tests performed in Maryland counseling and testing sites were performed on an anonymous basis (unpublished data, G. vanBlerk).

The overall rate for parenteral drug users (8/142, 5.6 percent) is lower than the rates seen in Maryland counseling and testing sites through 1986 (12.3 percent) and in serosurveys in methodone maintenance centers in Baltimore, 15.2 percent (unpublished data, D. Glasser) to 29 percent.[34] The data from STD clinic attendees reflect the inclusion of not only frequent parenteral drug users and/or persons with drug dependency but also of casual and experimental users. Attendees were asked to indicate if since 1978, they had ever used a needle to shoot drugs into a vein or under the skin. They were not asked about the frequency of needle use.

Data from the Maryland Addictions Administration indicates that approximately 0.9 percent of the population uses opiates. Among STD clinic attendees, 6.7 percent admitted to injecting drugs parenterally on at least once occasion, and 11.4 percent had a sex partner who had used drugs parenterally. Health education regarding drug use and the risk of HIV infection should be provided to STD clients. Efforts to discourage even casual drug use, to discourage sexual activity with known drug users, and to encourage participation in drug treatment programs should be initiated in STD clinics.

The scope of STD clinic services should be broadened to include counseling, education, and referral services for health needs related to risk of HIV infection. Provision of or referral for contraceptive and substance-abuse services and routine HIV counseling and testing will necessitate an increase in professional staffing to deal with the expanding clinical responsibilities and the additional time that must be alloted for each patient visit.

Acknowledgments

An epidemiologic survey of this magnitude would not be possible without the cooperation and assistance of many individuals throughout Maryland. Our appreciation is extended to the local health officers and the staff of the STD clinics in the 22 participating counties, the Commissioner of Health and Richard Dunning and the staff of the STD clinics of the Baltimore City Health Department, the directors of the regional laboratories, the staff of the syphilis serology laboratories, and the staff of the retrovirology laboratory. We thank Dr. Lawrence Rose and Dr. Joel Kleinman for their review and comments.

Financial support for this project was provided in part by a cooperative agreement with the Centers for Disease Control - Grant #U62/CCU302047-01.

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

MARYLAND DIAGNOSTIC IMAGING CENTER

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

Prehospital Providers' AIDS Knowledge and Attitudes

Michael E. Thompson MS and James N. Eastham, Jr., ScD

The authors are with the Charles McC. Mathias National Study Center for Trauma and EMS and the Emergency Health Services Department, University of Maryland, Baltimore County/MIEMSS Baltimore. **Reprints:** *James N. Eastham, Jr., ScD, Emergency Health Services, Academic IV, Room 316, University of Maryland, Baltimore County, Baltimore, MD 21228.*

Of the 110 career and volunteer prehospital care providers surveyed from two Maryland counties, about 20 percent were concerned about dealing with AIDS patients, including 24 percent who have considered leaving EMS due to the risk of HIV infection.

Prehospital Emergency Medical Service (EMS) providers routinely perform basic and advanced life support interventions on patients about whom very little is known at the time of treatment. This EMS response typically includes extrication, hemorrhage control, invasive procedures, other exposures to blood or body fluids, and contact with sharp and potentially contaminated objects.[1,2] Consequently, infection control in the EMS environment is inherently less controllable than in the hospital setting, although equally critical to the health of both patient and provider. Thus EMS providers should be well versed in infection control principles and practices. Research regarding prehospital provider's infection control awareness by Fishman and Stamp,[3] however, revealed that prehospital care providers are not sufficiently knowledgeable about infection control procedures to adequately protect themselves or their patients from infections. This issue needs to be addressed, specifically in light of the emergence of the acquired immunodeficiency syndrome (AIDS) and its etiological agent, the human immunodeficiency virus (HIV), as a major health concern.

Although many AIDS education programs[1,2,4-6] have been developed to address the needs and concerns of prehospital providers, provider knowledge and attitudes concerning AIDS, HIV, and appropriate infection-control practices have not yet been reported in the literature. Establishing this baseline is an important and necessary prerequisite in the evaluation of both established and proposed educational interventions that address control and prevention of communicable diseases. We examine variations in provider knowledge and attitudes, controlling for the selected provider characteristics of skill level, pay status, county, and self-reported familiarity with the Centers for Disease Control[7] (CDC)/Maryland Institute for Emergency Medical Services Systems[1,2] (MIEMSS) Infection Control Guidelines.

Methods

A sample of 110 Maryland prehospital care providers was drawn from two suburban Baltimore counties, denoted as County A and County B. The sample represented 1.8 percent of the EMS providers from the two participating counties and 0.5 percent of all state EMS providers. Subjects were enrolled in skills refresher classes during the spring of 1988. In all, six classes were surveyed: one First Responder, one EMT-A, and one Cardiac Rescue Technician/Paramedic course from each of the two counties. The providers enrolled in these classes were all actively involved in EMS field care. The response rate was 100 percent return and completion.

A 35-item AIDS knowledge and attitude survey was constructed, adapting items from a survey by Wertz *et al.*[5] The Wertz survey originally was developed to assess the effectiveness of a hospital-based provider education program. Adaptations of the survey were necessary for improved clarity and applicability to EMS providers. Transmission risk items and infection control items addressed the respondents' knowledge of the common routes of exposure to infectious agents and the appropriate level of personal protection to be employed in preventing exposure to HIV. The appropriate responses were derived from the Centers for Disease Control (CDC)/Maryland Institute for Emergency Medical Services Systems (MIEMSS) infection control guidelines, which had been distributed to EMS providers statewide by MIEMSS.[1,2] Attitudinal items were assessed using a six-point Likert scale. Basic demographic information of skill level, career status, and self-reported guideline familiarity also was collected.

Individual responses to the 15 knowledge items were compared to appropriate answers based on the CDC/MIEMSS guidelines. Each respondent was given a "knowledge score" based upon the number of correct responses according to the CDC/MIEMSS guidelines. Knowledge scores can range from 0 to 15. Similarly, an "overcautiousness score" was derived from the number of instances where the extremely cautious response was inappropriately selected. The overcautiousness score consisted of the 10 items whose appropriate response was neither "Very Likely" nor "Always." Knowledge item responses were examined when controlling for the respondent's skill level (invasive/noninvasive), career status (paid/volunteer), county of practice, and self-reported familiarity with the CDC's infection control guidelines. Attitudinal items that addressed career issues were similarly analyzed. Statistical analyses include Fisher's exact test and student's *t* test. Statistical significance was set at $p < 0.05$.

Results

The sample (N = 110) consisted of 26 first responders (FR), 32 basic life support emergency medical technicians (EMT-A), 7 intravenous therapy technicians (EMT-IV), 26 cardiac rescue technicians (CRT), and 19 paramedics (EMT-P). For the purpose of analysis, the subjects were condensed into two skill levels: noninvasive (FR, EMT-A; N= 58) and invasive (EMT-IV, CRT, EMT-P; N= 52). Approximately three-fourths of the sample were paid providers. One-third of the paid providers also reported additional volunteer work at their local station; these respondents were classified as career providers for the analysis. The demographic data are summarized in Table 1.

Knowledge Of the 7 transmission risk assessment items and the 8 infection control procedure items comprising the knowledge portion of the survey (Tables 2a, 2b), the respondents' average knowledge score was 7.6 (standard deviation ± 2.2). As shown in Table 3, no one correctly answered less than 3 knowledge items; no respondent correctly answered all 15 items. The average over cautiousness score was 2.80 (SD ± 2.2). Twelve respondents (11 percent) did not indicate any inappropriate extreme responses, while one respondent (1 percent) indicated the maximum of 10 over-

Table 2a. HIV Transmission Risk Assessments Among Prehospital Care Providers

HIV Transmission Risk	Very Likely	Possible, but Unlikely	Very Unlikely	CDC/ MIEMSS Standard
Needlestick	87 (79%)	20 (18%)	3 (3%)	Very likely
Mouth-to-mouth resuscitation	42 (38%)	58 (53%)	10 (9%)	Possible but unlikely
Shaking hands	2 (2%)	14 (13%)	94 (86%)	Very unlikely
Touching bloody equipment	40 (36%)	60 (55%)	10 (9%)	Very unlikely
Splashing of blood on intact skin	38 (35%)	48 (44%)	24 (22%)	Very unlikely
Cleaning up vomit	27 (25%)	6 (56%)	122 (20%)	Very unlikely
Changing linen	18 (16%)	53 (48%)	39 (36%)	Very unlikely

cautious responses. Student's *t* test analysis of the score means when controlling for the provider characteristics yielded no significant results.

Self-reported familiarity with the CDC/MIEMSS guidelines was associated with a weak but consistent trend toward more accurate transmission risk knowledge. Changing soiled linen was the only item to obtain the requisite significance level ($p < 0.05$). For the items shaking hands, touching bloody equipment, and splashing of blood on intact skin, marginal statistical significance ($p < 0.10$) was observed. The lack of statistical significance of these items is partly attributable to the small sample size.

The majority of respondents, when disagreeing with the CDC/MIEMSS infection control guidelines, erred by overstating their risk of acquiring AIDS and their need for prophylactic barrier devices. Respondents who reported they were familiar with the guidelines, when erring were less likely to indicate the inappropriate overcautious response "very likely" for the transmission risk items of touching bloody equipment ($p < 0.05$), splashing blood on intact skin ($p < 0.10$), and cleaning of vomitus ($p < 0.10$) than those who reported they were not familiar with the guidelines. Controlling for training level indicated that invasive providers were significantly ($p < 0.05$) more knowledgeable than their noninvasive counterparts about risk of HIV infection from blood exposures. No statistically significant associations between provider pay status and knowledge level were observed.

Controlling for county of service revealed a significant response difference in reported need for barrier precautions such as gowns, masks, eyewear, and gloves. Respondents from County B were more likely ($p < 0.05$) than respondents from county A to see gowns, masks, gloves, and eyewear as always necessary (Table 4). The CDC/MIEMSS guidelines indicate that gowns, masks, and eyewear are rarely necessary in the field and that gloves are necessary when exposure to blood is likely, that is, sometimes necessary. No differences were observed for the remaining infection control items, all of which pertained to procedural practices rather than to the use of a physical barrier.

For AIDS knowledge and information, respondents rely on formal training programs and journals as their primary sources (Table 5). Controlling for provider characteristics revealed that noninvasive providers were more likely than invasive providers ($p < 0.05$) to see fellow EMS providers and television/radio as very important sources of their AIDS information. Additional information sources cited as "Very Important" included other health professionals and family and friends.

Attitudes The attitudinal item responses (Table 6) provided insight into the dichotomous feelings

Table 2b. Reported Necessity of Selected Infection Control Procedures among Prehospital Care Providers

Infection Control Procedure	Perceived Necessity			CDC/MIEMSS Standard
	Always	Sometimes	Rarely	
Discard needles without recapping	90 (82%)	9 (8%)	11 (10%)	Always
Avoid unprotected contact with blood	99 (90%)	9 (8%)	2 (2%)	Always
Handwashing	106 (96%)	3 (3%)	1 (1%)	Always
Use of gowns	14 (13%)	67 (61%)	29 (26%)	Rarely
Use of masks	18 (16%)	60 (55%)	32 (29%)	Rarely
Use of gloves	89 (81%)	21 (19%)	0 (0%)	Sometimes
Use of protective eyewear	20 (18%)	63 (57%)	27 (25%)	Rarely
Covering of provider's open wounds	107 (97%)	3 (3%)	0 (0%)	Always

Table 3. Exact Agreement and Overcautious Response Scores among Prehospital Care Providers

Number of Exact Agreement	Frequency	Percent	Number of Overcautious Responses	Frequency	Percent

Television/radio *	34 (59%)	17 (33%)

* $p < 0.01$, Fisher's Exact Test

surrounding AIDS. For example, when combining all three agreement response categories, 70 percent of the respondents believe they have sufficient training to protect themselves from HIV infection, yet 68 percent indicated that the threat of AIDS is one of the more stressful aspects of EMS, and 68 percent fear spreading AIDS to their families. Also, if properly protected, 77 percent indicated they would treat an AIDS patient, but given a choice 75 percent would prefer not to, and 29 percent feel that EMS providers should not be required to treat AIDS patients. Of concern to EMS system managers is the 24 percent who have considered leaving EMS; the 21 percent who, if they knew then what they now know about AIDS, would never have gotten involved in EMS; and the 22 percent who would not recommend EMS work to a friend.

When controlling for provider characteristics, noninvasive providers were more likely ($p < 0.05$) than invasive providers to perceive AIDS as stressful and think EMS providers should not have to treat AIDS patients (see Table 7). Volunteers were more likely ($p < 0.05$) than paid providers to think that EMS providers should not have to treat AIDS patients and to have considered leaving EMS. No significant associations were observed for self-reported guideline familiarity or county of service.

Table 6. Attitudinal Item Responses of Prehospital Care Providers

Statement	Strongly Agree	Agree	Tend to Agree	Tend to Disagree	Disagree	Strongly Disagree
I have sufficient knowledge to protect myself from AIDS.	14 (13%)	23 (21%)	39 (36%)	21 (19%)	9 (8%)	4 (4%)
Working with AIDS is one of the more stressful parts of EMS.	22 (20%)	28 (25%)	25 (23%)	25 (23%)	5 (5%)	5 (5%)
Because I work as an EMS care provider I fear spreading AIDS to my family.	32 (29%)	20 (18%)	23 (21%)	25 (23%)	5 (5%)	5 , (5%)
If I were properly protected, I would treat someone known to be infected with the AIDS virus.	14 (13%)	38 (35%)	32 (29%)	13 (12%)	4 (4%)	9 (8%)
If I had a choice, I would prefer to avoid treating a person with AIDS.	32 (29%)	24 (22%)	26 (24%)	16 (15%)	10 (9%)	2 (2%)
I think prehospital providers should not be required to work with AIDS patients.	6 (6%)	12 (11%)	13 (12%)	44 (40%)	24 (22%)	11 (10%)
I am concerned enough about my risks of contracting AIDS that Ihave considered leaving EMS.	6 (6%)	7 (6%)	13 (12%)	28 (26%)	38 (35%)	18 (16%)
Knowing what I now know about AIDS, I would not have gotten involved in prehospital care.	4 (4%)	8 (7%)	11 (10%)	20 (18%)	51 (46%)	16 (15%)
Because of the AIDS situation, I would not recommend a career as a prehospital provider to someone I know.	7 (6%)	3 (3%)	14 (13%)	20 (18%)	44 (40%)	22 (20%)

Table 7. Distribution of Responses Agreeing (Tend to Agree, Agree, or Strongly Agree) by Provider Characteristics

Statement	Noninvasive (n=58)		Invasive (n=52)	Volunteer (n=29)		Paid/Both (n=81)
Working with AIDS is one of the more stressful parts of EMS.	47 (81%)	*	28 (54%)	22 (76%)		53 (65%)
I think prehospital providers should not be required to work with AIDS patients.	21 .(36%)	*	10 (19%)	13 (45%)	*	18 (22%)

Discussion

Self-reported familiarity with the CDC/MIEMSS guidelines was the variable most closely associated with transmission risk knowledge and conversely fewer extreme (overcautious) responses to the transmission risk items. As previously mentioned, small sample size may have contributed to the marginal significance ($0.10 < p < 0.05$) of the transmission items of touching bloody equipment, splashing blood on intact skin, and cleaning up vomitus. The association between self-reported familiarity, accurate transmission risk knowledge, and reduced occurrence of inappropriately cautious responses is encouraging. It indicates the efficacy of mailed informational materials, provided they are read. These materials, particularly when coupled with classroom instruction such as

the new MIEMSS Infectious Disease Program, are potentially an effective and efficient means of educating and informing EMS providers. This assertion is supported by several hospital provider studies[5,6,8,9] that report the efficacy of in-service education programs.

County of service was associated with infection control procedure knowledge level. Respondents from County B were more likely than respondents from County A to perceive barriers such as gowns, masks, eyewear, and gloves as always necessary. The CDC/MIEMSS guidelines for these items indicate that gowns are never necessary in the field, masks and eyewear are only necessary if splashing of blood is a possibility, and gloves are necessary when contact with blood is expected. This threat is clearly not present on every EMS call made. Both counties' policies conform to the established MIEMSS guidelines and procedures. Possible explanations for this diversity include county differences in informal policy or sensitization to AIDS issues from a well-publicized incident. Such findings warrant further investigation. Not only do inappropriate use of barrier precautions result in the waste of valuable material resources, but also they may reflect unsubstantiated fear of HIV infection and cause distress to patients who may negatively react to providers dressed like "spacemen."

The mean aggregate knowledge score (51 percent) was disappointingly low. One caveat in interpreting this result, however, is that many of the incorrect responses reflect selection of the median responses: "possible, but unlikely" or "sometimes necessary." Selection of these responses may reflect differences in semantic interpretation of the terms used rather than differences in true knowledge. The frequency of inappropriate extreme responses, mean score of 28 percent, however, suggests this is not entirely the case. Responding with inappropriate (overcautious) responses clearly indicates a lack of knowledge or of unwarranted fear. Eighty-nine percent of the respondents provided an inappropriate extreme response to one or more items; 20 percent to at least half (five or greater) of the items. Obviously, there is a great deal of room for improvement in EMS providers' AIDS knowledge. Fortunately, this knowledge deficit results in the provider being inappropriately cautious rather than in the endangerment of the patient or the provider.

EMS providers indicated that formal education programs and journals are their primary sources of AIDS information. These findings further support the previous contention that printed informational materials, when combined with classroom instruction, are an effective means of educating EMS personnel. Noninvasive providers were more likely to rely on information sources such as television and fellow providers than were their invasive counterparts. Thus, different approaches to educating the noninvasive and invasive provider may be warranted.

The attitudinal items revealed a group of 24 percent who are concerned enough with the AIDS threat to EMS providers that they have considered leaving EMS. Sixty-eight percent of the respondents consider AIDS one of the more stressful aspects of EMS. A similar number fear spreading AIDS to their families. Clearly efforts must be made to address these concerns and to reassure EMS providers through education and counseling programs. Paradoxically, 77 percent of the respondents would treat an AIDS patient if properly protected, yet a similar number would prefer to avoid doing so, given the choice. In this respect, the providers were generally homogenous, with only three items (Table 7) displaying any significant variation when controlling for provider characteristics. These results, however, indicate the possibility of a trend toward greater AIDS/HIV concerns among noninvasive and volunteer providers. Such a trend would be consistent with the contention that increased education reduces AIDS/HIV concerns. The limited sample size did not permit simultaneous control for both training level and career status. A lager sampling would enable further examination of this trend.

EMS providers' conflicting attitudes toward dealing with AIDS patients may indicate a mercurial temperament. These providers may be responding to the AIDS situation emotionally rather than logically. The absence of a solid knowledge base plays a pivotal role in such a response. Such findings are particularly important to areas serviced by volunteers. Most volunteer recruiting is by word-of-mouth.[10] Reducing the number of new volunteers due to unwarranted fears or rumor of HIV infection risks could exacerbate current volunteer manpower shortages. Disgruntled providers also may act as constant agitators who influence and incite others, possibly leading to increased tension and counteracting any progress made through education and information programs.

A statewide assessment of prehospital providers' AIDS/HIV knowledge and attitudes is warranted. Such a study would provide a valuable perspective of current knowledge levels and attitudes while also providing a benchmark against which to evaluate educational and counseling program effectiveness.

Presents

Baltimore County Professional Building

Location	:	Barry Paul Road just off Old Court Road near the intersection of Liberty Road and down the street from Baltimore County General Hospital.
Total Square Footage	:	10,320 square feet, minmum bay size is 1,720 square feet
Rental Rate	:	$12.00 per square foot net
Additional Expenses	:	Taxes, building insurance and common area charges are the responsibility of the Tenant. Expenses are estimated to be $2.00 per square foot.
Utilities	:	Tenant will be separately metered and responsible for its own utilities.
Ocupancy	:	Immediate
Term of Lease	:	A minimum of three (3) years. Five year terms or longer are preferred.
Amenities	:	Individual entrances, restroom facilities, heating/air conditioning controls in each suite.

Your Day in Annapolis

DOCTOR OF THE DAY

Each year since 1964, *the Medical and Chirurgical Faculty* and its physician members staff the first aid facility at the state capitol during the General Assembly Session. This is made possible through the generous donation of one day of **your** time to serve in the first aid room located in the State House in Annapolis.

The first aid facility is open to legislators, their staffs and the public for the 90-day session. A registered nurse is on duty during this time. It is very important, however, that we provide a **"Doctor of the Day"** *each and every day* of the legislative session. As the Doctor of the Day, you are provided an opportunity to see firsthand the workings of the Maryland State Legislature while staffing the first aid facility.

Please take a moment to check your calendar and determine if you are able to donate a day of your time to the first aid facility in Annapolis. Preceding is a post card indicating the dates of the 1990 Legislative Session. Please fill out and return the card to Med Chi if you are able to serve. You will receive a confirmation card and then later a letter explaining when and where to report. (Please note, all Monday dates are *evening sessions* - beginning at 4:00 p.m. and ending at 9:00 p.m.)

Thank you for your interest and willingness to participate in this unique and valuable experience. For more information, call Med Chi's Legal Department at 301-539-0872 or toll free in MD at 1-800-492-1056.

Maryland's 1990 Legislative Session
January 10 - April 9, 1990

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, PIE Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. PIE Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

The Head-Injured Outpatient: Presentations and Rehabilitation

Antoinette DeFazio PhD, Mark P. Kelly PhD, and James P.G. Flynn MD

Dr. DeFazio is Director of Clinical Neuropsychology, Montebello Hospital and the Shock Trauma Center of the Maryland Institute for Emergency Medical Services Systems (MIEMSS), Baltimore. Dr. Kelly is Clinical Neuropsychologist on the Head Injury Unit at Montebello Hospital, Baltimore. Dr. Flynn is Acting Director of MIEMSS and Director of Montebello Rehabilitation Hospital, University of Maryland Medical System.
Reprints: *Antoinette DeFazio PhD, MIEMSS, 22 S. Greene St., Baltimore, MD 21201-1595.*

Head injury, which annually affects 154 per 100,000 persons in Maryland, is a serious problem requiring attention from the medical community. The role of the general practitioner is viewed as central to the process of rehabilitation since this medical professional has a pre-existent relationship with the patient and the family.

The origins of rehabilitation date back to the turn of the twentieth century, when it was observed that patients in a tuberculosis sanitorium who participated in an occupational therapy program did better than those who did not participate, regardless of level and advancement of disease. By the end of World War I, dramatic changes had occurred in the management of the wounded, resulting in better outcomes compared with prior conflicts. For the first time in medical and general social literature, comments emerged concerning patients suffering from "head injury" and "shell shock." Also noted was the inability of the health care delivery system to cope with the immediate and, more importantly, the long-term effects once the individual returned to the civilian community. Many of the head injured never returned to employment, were admitted to closed psychiatric units, and were a constant drain on their families' emotions and financial resources.[1-4] Head injury rehabilitation has remained a major challenge to all aspects of the health care delivery system. In this article we focus on patients who return to the community upon discharge from an acute care setting and, in most instances, a rehabilitation hospital. These patients still may be participating in outpatient rehabilitation to promote reintegration into the community.

Nationally, approximately 500,000 individuals suffer severe head injuries each year.[5] Review of Maryland data indicates an annual incidence of 154 severe injuries per 100,000 cases of head trauma, which approximates the incidence of 152 per 100,000 in Rhode Island.[6,7] Twenty-eight percent of head injuries occur in individuals age 15 through 24 years, 19 percent in individuals age 25 through 34 years, and 10 percent in individuals age 35 through 44 years.[8] Males account for 67 percent of all patients with head injuries. Though this injury occurs primarily in young males, one must also recognize its occurrence among older individuals.[9] In

Maryland, 6,000 persons survive serious head injury annually. Financially, the treatment of head injury is a multibillion dollar industry.

Acute Care Management

Improvements in evacuation procedures and acute medical management of patients with traumatic head injury have greatly increased the likelihood of survival. Medical management has advanced in complexity as more sophisticated diagnostic and treatment modalities have become available. The expanding body of knowledge about head injury and the evolving methods of treatment have led to the development of specialized centers with teams dedicated to treating trauma.

The pathophysiology of head injury can be divided usefully into two types: primary and secondary injury. Primary brain injury occurs at the time of impact and is the result of mechanical factors, that is, direct disruption of the brain tissue and supporting structures. A major cause of primary brain damage following closed head injury is diffuse microscopic shearing/stretching of nerve fibers.[10] This may occur with injury of all grades of severity. Macroscopic lesions occurring at the time of impact include contusions and brain lacerations.[11] Regardless of the site of impact, contusions tend to occur most frequently in the frontal and temporal areas.[12] Secondary injury, which is delayed and a consequence of complications, is caused by processes triggered by the injury. Examples of processes causing secondary brain injury include intracranial hypertension and infection. Secondary damage related to extracranial factors may result from conditions such as hypoxia or emboli.[12] Intervention is aimed at preventing or limiting the secondary brain damage and preventing complications. In addition, many brain-injured patients have associated injuries that require the services of other surgical specialties. Severely traumatized patients also have metabolic, endocrine, autonomic, and pulmonary dysfunctions requiring the services of specialists in critical care medicine.

The severity of the head injury has direct significance in terms of expected functional outcome. Several clinical methods are available to assess severity of diffuse traumatic brain injury. The Glasgow Coma Scale provides a standard assessment of coma and disorders of consciousness in the immediate postinjury period.[13] The scale rates a patient's ability in three areas: eye opening (scores range from 1 [no eye opening] to 4 [spontaneous eye opening]), best motor response (scores range from 1 [no response to pain] to 6 [following simple commands]), and best verbal response (scores range from 1 [no verbalization] to 5 [verbalization of correct orientation]). Total scores range from 3 to 15, with scores of 3 to 8 rated as severe, 9 to 12 as moderate, and 13 to 15 as mild. The Glasgow Coma Scale is highly correlated with outcome in the acute hospital phase and more modestly with long-term outcome.[14,15] Another useful guide to severity of head injury is the duration of posttraumatic amnesia (PTA). Loss of ongoing memory for daily events after trauma onset (or PTA) is a very consistent and striking feature of diffuse traumatic brain injury. This memory loss may last for periods ranging from several seconds to many months or longer.[16]

Severe Brain Injury

The most obvious neurological sign in patients sustaining severe traumatic brain injury is coma. Coma is not a unitary phenomenon but occurs along a gradient of severity as assessed by the Glasgow Coma Scale. Recovery from coma tends to occur in stages. With lengthy periods of coma, recovery tends to be slow and stages are discerned easily. When duration of coma is relatively brief, passage through various stages may be so rapid as to obscure a recognizable progression.

Upon initial awakening from coma, the patient will tend to be alert but unresponsive. The first level of responsiveness achieved is often nonverbal, with recovery of the ability to speak immediately following. When the patient initially becomes verbal, confusion and dependency on others for basic self-care needs (bathing, dressing, etc.) are evident. Behavior is sometimes agitated and not goal directed during this phase of recovery. The ability to take responsibility for self-care then returns; significant deficiencies in attention, memory, and problem solving (cognitive functions) may be quite remarkable. Marked changes in affect, personality, and behavior may become prominent after confusion is cleared. Frequently, patients are affectively labile, with sudden episodes of laughing, crying, or anger that are out of proportion to provocation and may dissipate as quickly as they appear. Many patients are impulsive and manifest extremely poor judgment when engaged in everyday activities and often lack social awareness and inhibitions. Difficulties in initiating activities and sustaining motivation are extremely common. The long-term recovery from severe injury is a lengthy process. Typically, the most significant recovery of cognitive/behavioral changes occurs within the first three to six months subsequent to the injury. Severely injured patients are often in formal rehabilitation programs during this period.[17]

One large study looked at complaints after a severe concussion and found the most common items checked by patients were forgetfulness (54 percent), irritability (39 percent), slowness (33 percent), poor concentration (3 percent), fatigue (30 percent), and dizziness (26 percent). Posttraumatic amnesia (PTA), as assessed by the time from injury to return of day-to-day memory, was correlated with return to work in this population. If the PTA exceeded the "unlucky" number of 13 days, there was more difficulty returning to work.[18]

Slower improvement may occur well beyond the first six months after injury and persist for many months or years. Despite improvements in other areas, many patients go through a period of significant emotional

discomfort during the latter part of the first year after their injury; disturbances of significant relationships also appear to "peak" at this time. Appearance of emotional discomfort and deterioration of relationships have been related to realization by the patient and family of the severity and permanence of the patient's problems.[19] Monitoring, support, and referral for evaluation and treatment of behavior problems often must be considered at this juncture. Whenever possible, referral to a center specializing in services for traumatic brain injury is desirable. Even with the passage of many months and optimal treatment, many patients are left with a disabling deficit in memory, personality, and affect, which requires long-term intervention.[20]

One of the most persistent and aggravating symptoms associated with severe brain injury is recent memory disturbance.

Forgetfulness is a complaint frequently expressed by brain injury patients for years after injury. A second common and persistent deficit is the inability to switch from one task to another rapidly. Patients with managerial jobs often find it difficult to maintain them. One patient described the phenomena as though his brain "stuttered" and would not continue. This symptom was particularly reported as a problem in the two-year follow-up after severe injury. Another common finding is that these patients have difficulty resuming an activity that has been interrupted; for example, if a man leaves a task to answer a phone call, he forgets what he was doing originally.[18]

Personality changes are not unusual in the more moderate to severe head injury group. Often these changes are an exaggeration or aggravation of premorbid symptoms such as irritability, impulsiveness, substance abuse, or marital and sexual problems. Other changes, such as alterations in interpersonal sensitivity, emotional regulation, and motivation, pose extremely difficult challenges for family adjustment.[21,22] Additionally, patients and at times family members may refuse to acknowledge the changes in their lives or try to minimize them.

Postconcussive Syndrome

Patients with severe head injuries are usually identified early and have an array of services organized for them following hospitalization. These usually include inpatient rehabilitation on a specialized head injury unit such as found at Montebello Rehabilitation Hospital.[17] The severity of symptoms makes these patients easily identifiable. However, the majority of patients presenting to hospital emergency rooms for traumatic brain injury have suffered mild head injuries.[8] Although there are several ways to operationally define mild traumatic brain injury, the term generally applies to patients with brief or no loss of consciousness, a relatively short period of PTA, and no gross structural damage to the brain. Many of these patients are hospitalized briefly (because of risk of delayed complications such as subdural hematomas); some may never be admitted. Computed tomography (CT) scans, when ordered, are usually normal.[23] These patients frequently complain of one or several of a cluster of symptoms, often referred to as the postconcussive syndrome.

Characteristics of the postconcussive syndrome include irritability, diminished ambition, decreased tolerance to stress, lability of affect, tendency toward impulsive or irresponsible behavior, easy fatigue, dizziness, headaches, decreased concentration and attention, and memory deficits, especially short-term deficits. There is additionally decreased tolerance to noise and light, and disturbances in sleep, sexual behavior, and interpersonal relationships are frequent. Family life is often affected by these symptoms.[22] Many of these patients deny the implications of their symptoms and persist at attempting to return to work and socializing, with marginal results.[21]

The origin of these symptoms is not fully understood and may be multifactorial. Evidence for subtle cerebral dysfunction after mild head injury comes from a number of sources, including autopsy studies (which have identified microscopic lesions), magnetic resonance imaging (MRI), and electrophysiological studies.[11,24] Neuropsychological studies also confirm the presence of cerebral dysfunction after mild head injury.[25] It has been suggested that preinjury personality or emotional problems may result in persistence of postconcussive symptoms, but many patients without previous psychiatric problems develop these symptoms. Likewise, litigation and the potential for financial gain may contribute to the presentation and persistence of these symptoms in some situations, but these factors are not operative in most cases.[26]

A recent study found that 34 percent of previously employed individuals were not working three months after sustaining a mild brain injury, an indication of the morbidity related to this problem.[26]

Management of these patients should ideally include early neuropsychological assessment, patient and family education about the expected course of recovery, gradual resumption of family and job responsibilities, and regular follow-ups as needed. Assuming too many responsibilities too soon may lead to aggravation of the postconcussive syndrome and prolonged difficulties.

The mood disorders often seen clinically in postcon-

cussive symptom patients, especially depression, can be puzzling to clinicians. Depression is generally thought of as part of the secondary psychological reactions to diminished capacity to deal with everyday tasks. However, there is evidence from the stroke literature that lateralized brain damage is associated with mood disorders.[27] Researchers have speculated that these mood disturbances are a result of alteration in neurotransmitters in the brain, and this may also be the case with head injury. Psychological reactions can interact with these proposed biological changes to further compound a patient's adjustment. Lastly, premorbid factors seem to affect emergence of these symptoms.[28]

Age at Injury

The developmental stage of patients is also a factor in the outcome of head injury. Recent research literature consistently points out that the earlier the head injury occurs, the more effect it has on the entire unfolding development of the patient. Especially in adolescence and early adulthood, young persons are attempting to establish identities separate from their parents. They frequently have rituals and rites that label them as part of their peer group. They have yet to firmly establish occupational, sexual, and community identities. Head injury drastically complicates that adjustment.[29]

Older persons with head injury also present special problems. Some estimates put the rate of admission for traumatic brain injury in the elderly at 10 to 13 percent of the head-injured population.[9] Persons 50 years old and older have incipient impairment of the senses; for example, hearing difficulties increase and vision becomes poorer, especially at night. Older persons (over 65) also frequently show some changes in memory and learning capacity, especially if they are not in an occupation where they need to continue to learn new material. In one review of 26 elderly patients admitted to a rehabilitation hospital, 85 percent of them went home and half were independent in daily living skills. Although 12 had been employed full-time or part-time before head injury, none returned to work by follow-up two to five years after discharge. All reported difficulty ranging from mild short-term memory loss to problems requiring total nursing care.[9]

While the information on older patients and head injury in long-term outcome is still preliminary, clinically it has been observed that many of these patients show a decline in cognitive function greater than that expected by the head injury.

At times it is suspected the patient's accident may have been a consequence of poor judgment and sensory failure in existence before the head injury. There is some evidence in the orthopedic literature that the cognitive status of patients over 75 years of age admitted to a hospital for hip fractures was impaired even though they had sustained no head injury.[30]

Therapies and Treatments

Reviewing the literature for recommended therapies and treatments following head injury is an exhausting and frustrating chore. The literature is primarily experiential, with few or equivocal results documented in controlled scientific studies. Thus, the following review presents a smorgasbord of possibilities available to the head injured, along with some commentary as to who might profit from these interventions.

Behavioral therapies The behavioral therapies derive from the theory that the frequency of some behaviors can be increased or decreased systematically by reinforcement procedures. They have been used with some success on inpatient units for disruptive behaviors and poor compliance with the rehabilitation program.[19] Their application to the home environment appears to be limited. Families often are not equipped educationally or emotionally to handle behavioral problems with detachment and record keeping.

Cognitive remediation Cognitive remediation or cognitive rehabilitation derives from the idea that the brain is an organ like a muscle and can be exercised. The concepts that the brain has duplicative parts and that one area can be trained to take over the function of another area are sometimes implied. Under this heading, straightforward compensatory strategies are also included. Thus, patients with memory and learning deficits are often referred to speech-language pathologists and psychologists skilled at assisting patients in relearning and learning strategies to enhance functioning. Some patients seem to profit from these interventions and, if they can generalize the strategies, genuinely improve. Clinically, memory functions, as assessed on standardized tasks, also are often improved, although without scientifically controlled studies, spontaneous recovery is difficult to separate from gains made through training and therapy.[19,31] Compensatory strategies as simple as using a tape recorder in school classes or business meetings, keeping a notebook of scheduled events, and wearing a programmable watch for reminders all have their place.

Some therapists use home computer systems with patients and give them self-paced remediation programs. Younger patients with a better education and some familiarity with computers seem to profit from these efforts. Patients with little formal education and older patients often find the concept of retraining puzzling and may need a more situational approach; for example, a laborer or house painter with memory pro-

blems may need to return to the job and receive specific instructions and cuing as to his responsibilities.

Psychosocial programs The preinjury profile of the young trauma patient often includes a history of alcohol and drug abuse, inadequate education, impaired occupational functioning, and social deficits. These may compound the interpersonal problems related to the neuropsychological impact of the injury. Attainment of social and occupational adequacy often requires a multidisciplinary approach. In many cases, "habilitation" is being attempted rather than rehabilitation.

A major problem in Maryland is that most of the psychosocial programs are clustered in Baltimore County. There is a pressing need for services on the Eastern Shore, in Western Maryland, and in Montgomery County. Funding of such programs is difficult to obtain privately, and many patients with head injuries do not have adequate (or any) insurance coverage.

Family therapy As previously indicated, families are usually involved with patients during their recovery. Families have a pressing need for information, support, reassurance, and guidance through the long, arduous postacute phase of head injury. Once the major medical crisis is past, there are feelings of relief, often followed by dismay at the level of dysfunction the injured person experiences. Patients may become self-centered, impulsive, irritable, and rigid. Changes in sexual interest or performance are common. As injuries often strike the family breadwinner, changes in family leadership roles may occur. In the first week after the injury, relatives are often grateful for the survival of their spouse or child and encouraged by his or her physical recovery. As patients return home and the extent of their persisting interpersonal changes becomes evident, the problems experienced by relatives may become more prominent. A recent study has documented that a significant portion of relatives of severely injured men suffer from clinically significant anxiety as well as poor functioning in the marriage and family context.[19] Family members of severely injured patients often require continued support after relatives return home from the hospital. Support groups for family members of head-injured patients can be extremely helpful in this regard. The primary care physician may assist family members in adjusting expectations for the patient and remind family members of the need to maintain their own health and morale in order to cope with this difficult situation. Development of the physician/family relationship may result in more ready acceptance of a referral for formal psychotherapy, marital counseling, or psychoactive medication if indicated.

Individual psychotherapy The patient may be aware of his or her difficulties, and at times individual therapy may afford the patient a face-saving way to discuss change. A number of patients who stoutly deny problems in front of their families are able to review their situation once they are not pressured. Unfortunately, insight into disability can be devastating, especially to patients who are limited in the ability to organize and plan for the future. If, however, patients are encouraged in day-to-day problem solving, they can improve. Denial as a psychological defense is usually inadequate since it permits no discussion, compromise, or solutions to problems. When denial becomes inadequate, patients may become depressed. Persistent posthead-injury depression appears to respond to the same treatments as any other depression; rapid treatment is recommended to limit psychological suffering and experiences of failure caused by disabling symptoms.[28]

Drug therapies Behavioral problems are not infrequent in the head-injured population and in some cases are caused by an underlying traumatic epilepsy. The likelihood of developing posttraumatic seizures is increased if a penetrating head injury such as a gunshot wound has occurred. Patients who begin to experience episodes of violence or other temper outbursts need to be referred to a behavioral neurologist for evaluation.[28] Neuropsychological evaluation is also frequently helpful to clarify the extent of damage. It has been noted clinically that patients with histories of violence have more trouble controlling their impulses after head injury but frequently show no evidence of true seizures. Behavioral interventions may sometimes be useful in this group.

Vocational rehabilitation One important index of morbidity following traumatic brain injury is employability. Traumatic brain injury tends to occur most frequently in youth, a prime time for vocation productivity. Factors relating to an individual's likelihood of returning to work are multiple, complex, and interactive. Injury severity has a major impact, with less severely injured patients more likely to achieve satisfactory vocational readjustment.[18] Age also has a major influence: younger individuals are more likely to return to work. Gross physical handicaps are an obvious impediment to good vocational outcome, as are significant persistent cognitive and emotional problems. Patients with higher premorbid intellectual skills and occupations tend to fare better, possibly due to their range of skills and motivational factors. Previous character problems appear to reduce the likelihood of good vocational adjustment. Individuals without a stable employment or academic history prior to their injury are unlikely to develop a stable vocational adjustment pattern after injury.[32] Finally, factors such as current economic conditions and willingness or ability of employers to accommodate to circumstances presented by disability may have a bearing on postinjury employability.

Reliable figures regarding the probability of return to work after traumatic brain injury are difficult to obtain. A recent study of patients with mild traumatic brain injury found that roughly one third of previously employed patients had not returned to work three months after injury.[23] It is assumed that most individuals with mild traumatic brain injuries eventually

return to work, though this never has been studied in great detail. Studies of severely injured patients have tended to include follow-up periods of several years. A recent review of several studies of severely injured patients followed for periods ranging from one to forty years found that the rate of return to work varied from 50 to 90 percent.[32] Many individuals who did return to work were in downgraded positions. The longer a person remains unemployed after a severe brain injury, the less likely the possibility of employment.

Patients can be assisted in the long-term return to work by the Department of Vocational Rehabilitation (DVR), which has become more aware of the needs of head-injured individuals and has initiated a referral service for the head injured.

The DVR offers work evaluations to determine strengths and weaknesses following head injury. Patients can be referred from 16 years of age on, so high-school-aged head injured can be monitored and evaluated before they graduate. The state is divided into regions; contact for services is usually made through one of the regional offices. Most evaluations are conducted at the Maryland Rehabilitation Center in Baltimore.

In less severe cases, in which the individual can return to work but needs assistance, the DVR can mediate between employer and employee in changing hours or conditions of employment. Some tax benefits are available to employers who hire the handicapped (including the head injured), which can assist a willing individual to gain entry level employment.

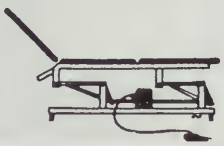
The Role of the Community Physician

The community physician confronted by the multiple problems of the head-injured patient might be frustrated by the complexity of assessment and treatment. Working with these patients usually requires a shift from a purely medical model to a psychosocial mode. Their rehabilitation typically requires multiple disciplines, and the busy physician may find it difficult to maintain communication channels. On the other hand, community physicians often have the trust of the families who come to them are therefore in a unique position to influence the life of a head-injured person and his or her family. Recognizing the head injury as a cause of social, emotional, and physical difficulty may be the first task of the physician, since, especially in milder cases, families and patients may not recognize the cause of the patient's problem. The following are suggestions for routine assessment:

1. Clinicians should ask patients if they have a history of traumatic head injury with or without a loss of consciousness. Usually some information as to pre- and post-traumatic amnesia is helpful prognostically.

2. Changes in personality, work habits, and emotional lability as well as changes in sleeping, eating, and sexual behavior should be assessed. In historically dysfunctional patients, exaggeration of preinjury deficiencies needs to be assessed. History should be obtained not only from the patient but also from a family member or significant other, since patients may have no insight into their condition.

3. Once a positive history is obtained, information from the treating hospital should be reviewed. Information on head injury suitable for families and patients is available from the Maryland Head Injury Foundation and is helpful in educating families and patients. When referral for specific specialized service is indicated, the primary care physician can serve a vital coordinating role.



Rehabilitation is a long process and the physician, patient, and family need to keep in mind that progress may be slow. It is important to keep treatment goals in the forefront so stagnation and discouragement do not occur.

WASHINGTON DC

Medicine in the 1990's, are you ready? Are you looking for new career challenges? George Washington University's Master of Public Health program serves the needs of clinicians entering a new era in medicine — an era in which skills in epidemiology-preventive medicine, administrative medicine, and occupational-environmental health are important for professional development. Set at the crossroads of academic clinical medicine, a major university, and the public health community of Washington, the program offers part- and full-time programs with weekday evening and Saturday morning classes.

SOCIAL SECURITY DISABILITY

Do you know what they require in a medical report?

If not, your disabled patients suffer.

- **PDS knows the requirements.** PDS will furnish checklists to focus your attention on questions that **must** be answered.
- **You receive a typed disability report,** reviewed by a professional, ready for your signature, with full supporting medical documentation.
- **PDS frees you from paperwork,** yet assures that you can file a thorough, timely disability report with Social Security.

Semiannual Session House of Delegates (329th Meeting)
Medical and Chirurgical Faculty of Maryland
Friday, September 15, 1989
Sheraton Resort and Conference Center, Ocean City

The 329th meeting of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was called to order at 9:30 a.m., the President, Raymond M. Atkins MD, and Secretary, Harold B. Bob MD, being present.

The following delegates (or alternates) were registered as being in attendance; an asterisk indicates an alternate delegate; (C) denotes Council member:

Allegany County
Augusto F. Figueroa
*Amado P. Torres**

Anne Arundel County
Thomas C. Cullis

Baltimore City
*Ian R. Anderson**
Timothy D. Baker
Willarda V. Edwards
Robert B. Goldstein
*Albert Folgueras**
Rafael C. Haciski
Thomas E. Hunt
Donald W. Mintzer
Hiroshi Nakazawa (C)
Samuel L. O'Mansky
*John B. Mac Gibbon**
Stephen K. Padussis
*Albert Nahum**
Karl H. Weaver
Jack M. Zimmerman

Baltimore County
Louis C. Breschi (C)
John W. Buckley
Esther Edery
John M. Krager

Cecil County
Andrew P. Fridberg (C)

Charles County
Guillermo E. Sanchez

Dorchester County
Paul A. Stagg (C)

Frederick County
Fred J. Baker

Harford County
Ben E. Oteyza

Howard County
Charles E. Taylor

Montgomery County
Carol L. Bender
DeWitt E. DeLawter
Charles H. Ligon
Ralph E. Longway
Herman C. Maganzini
Margaret T. Snow
*Eugene K. Sussman**

Prince George's County
Nelson Goodman
John E. Jeffery
Zorayda M. Lee-Llacer
George Malouf, Jr.
Robert Ruderman

Queen Anne's County
John R. Smith, Jr. (C)

Washington County
Edward W. Ditto
*Wayne A. McWilliams**

Wicomico County
Alex Azar (C)*
Hilda I. Houlihan
Paul S. Kajencki
Aubrey C. Smoot, Jr.
Farouk A. Sultani

Council
Albert M. Antlitz
Raymond M. Atkins
Harold B. Bob
Louis C. Breschi
Benjamin Del Carmen
Donald Dembo
Michael R. Dobridge
Bahram Erfan
Frederick J. Hatem
Francisco G. Japzon
Reynaldo Lee-Llacer
George S. Malouf, Sr.
Francis C. Mayle, Jr.
J. David Nagel
Gary L. Rosenberg
Roland T. Smoot
Joseph Snyder
Israel H. Weiner
Jose M. Yosuico

Past Presidents
Arthur T. Keefe, Jr.

Also present were members of the Faculty staff.

Invocation

Dr. David W. Fricke, a member of the Committee on Medicine and Religion, delivered the invocation.

Dr. Raymond M. Atkins, Faculty President, called for a moment of silence in memory of Dr. W. Bradley King Jr., who died on September 4, 1989.

The President made certain announcements, advising of various rules for conducting House business.

Minutes Approved

The minutes of the meeting of the House of Delegates held on April 12 and April 14, 1989, having been distributed to all members and corrected and approved by the Executive Committee, were presented to the House of Delegates. The House approved the minutes as corrected by the Executive Committee under Special Rule 1.

Media Awards

The President announced the winners of the media awards who will receive a certificate of recognition. The winners are as follows:

Daily Newspaper Category: Maureen Curran of the *Montgomery Journal* for her article, "Treatment Offers Hope Over Bone Deformities."

Magazine and Newspapers Category: Robert Kanigel of *Science Illustrated* for his entry, "Nicotine Becomes Addictive."

Radio and Television Category: Jamie Roberts of WJZ-TV for the series, "Shocked Sober."

Maryland Medical Journal Awards

The President announced the winners of the third annual *Maryland Medical Journal* awards:

Carl I. Schoenberger MD, Jay H. Weiner MD, Frank J. May MD, Jeanne Spellman MD, and Robert G. Waltersdorff PhD for their article, "Acute Pulmonary Histoplasmosis Outbreak following Home Renovation."

Charles Canady MD and co-author Phillip J. Goldstein MD for their article, "Elective Repeat Cesarean Section: Old Controversy, New Concepts."

Award to Allegany Health Right

Certificates of Appreciation were awarded to the creators of Allegany Health Right, a nonprofit organization that provides free health care to people whose incomes are too low to cover costs of health insurance or medical services but too high to be eligible for government aid. Dr. Amada P. Torres and Dr. Augusto F. Figueroa were present to accept the award on behalf of Dr. Wayne C. Spiggle and Allegany Health Right.

Emeritus Membership

Upon motion of the Secretary, Harold B. Bob MD, the following members were elected to Emeritus Membership in the Faculty, each having received the recommendation of their component societies and the Council:

Baltimore City
William Korman MD, Baltimore
Vantana Sadarananda MD, Baltimore

Baltimore County
Seymour Weiner MD, Phoenix

Prince George's County
Philip A. Cox MD, Fredericksburg, VA
Julio C. Quintana MD, Lanham, MD

Council Chairman Report

Dr. David Nagel, Chairman of the Council, reported that the Council, at its meeting on September 14, 1989, had entered into a contract with the law firm of Rifkin, Evans, Silver, and Lamone to provide legal services and legislative representation to the Faculty. He announced there would be a special meeting of the Council on October 19, 1989 to address the "white papers" and the involvement of the physicians in Maryland in the peer review process.

Treasurer's Report

Jose M. Yosuico MD, Faculty Treasurer, read the Certificate of O'Dea and Labrador, CPAs, as to the accuracy of the Faculty's books and records for the 1988 calendar year and an opportunity was given for questions. The House, by unanimous consent, approved the auditor's certification.

1988-1989 Committee Reports

An opportunity was afforded to raise questions or make comments on the following 1988-1989 committee reports, which had been distributed in writing to all members for information.

Report of the Delegates to the AMA -Albert M. Antlitz MD, Roland T. Smoot MD, Donald T. Lewers MD, George S. Malouf MD, Charles F. O'Donnell MD, Michael R. Dobridge MD (Interim Meeting, December 4-7, 1988)

Committee on Aids - Gabriel B. Jaffe MD, Chairman, Margaret T. Snow MD, Chairman

Committee on Alcoholism and Chemical Dependency - N. Joseph Gagliardi MD, Chairman

Report of AMA-ERF - Elizabeth A. Linhardt, State Chairman

Report of the Auxiliary - Mrs. Eva M. Edmonds, President

Computers in Medicine Committee - H.G. Oster MD, Chairman

Committee on Continuing Medical Education Review - Eugene P. Libre MD, Chairman

Committee on Drugs - Nelson G. Goodman MD, Chairman

Committee on Emergency Medical Services - Peter M. Fahrney MD, Chairman

Executive Director - Angelo J. Troisi, FACHE

Finance Committee - Jose M. Yosuico MD, Chairman, Treasurer

Committee on Hospital Medical Staffs - Victor R. Hrehorovich MD, Chairman

Legislative Committee - Nelson G. Goodman MD, Co-Chairman, Susan Guarnieri MD, Co-Chairman, Leonard Lichtenfeld MD, Co-Chairman, Israel H. Weiner MD, Co-Chairman

Liaison Committee with Department of Health and Mental Hygiene - Karl M. Green MD, Chairman

Treasurer - Jose M. Yosuico MD

Memorial Resolution

The Secretary, Dr. Harold Bob, read the following memorial resolution on Dr. Walter D. DeVault, Jr., which was adopted unanimously:

Walter D. De Vault, Jr. MD
1930 - 1989

Whereas, Walter D. DeVault MD, born in Knoxville, Tennessee, in 1930, received his medical degree from the Columbia College of Physicians and Surgeons in New York, interned at the University of California Medical Center in Los Angeles, and served his residency in the Urology Department at the University of Virginia Hosptial;
Whereas, He began his practice of medicine in Salisbury as a urological surgeon in 1962;
Whereas, Dr. DeVault then served with pride and enthusiasm as a member of the Department of Surgery, Division of Urology, at Peninsula General Hospital Medical Center untit 1982;
Whereas, He thereafter shared his skills and humanitarian interests while practicing urological surgery in Khamis, Saudi Arabia, and in Reshawav, Pakistan, working with Afghanistan refugees and giving testimony to the highest ideals of the healing arts;
Whereas, He enjoyed memberships in numerous professional, scholastic, and sportsmen organizations;
Whereas, Dr. DeVault served with dedication as a member of the Wicomico County Medical Society and the Medical and Chirurgical Faculty of Maryland, of which he was an Emeritus Member;
Whereas, He will be remembered for his irrepressible wit, his indomitable spirit, and as an inspiration to all who knew him, and his courage and humor are a legacy that will be cherished; and
Whereas, His death will leave a very real void in the lives of his family, friends, former patients, and colleagues; therefore, be it
Resolved, That this House of Delegates of the Medical and Chirurgical Faculty on September 15, 1989 adopts this resolution with an expression of profound sorrow on the death of Dr. DeVault; and be it further
Resolved, That this resolution be spread upon the minutes of this meeting and a copy be sent to his wife, Mrs. Sonnie Ford DeVault, in recognition of the high esteem in which Dr. DeVault was held and will be remembered.

Maryland Foundation for Health Care Election

The Secretary read the following list of nominations submitted for election to the Board of Directors of the Maryland Foundation for Health Care:

Baltimore City District (1992)
Paul Bormel MD, U, Baltimore City
Jack M. Zimmerman MD, GS, Baltimore City

Baltimore County District (1992)
Roger Theodore MD, GS, Baltimore County

Montgomery County District (1990)
James A. Rossi MD, IM, Montgomery County
(to fill vacancy due to resignation of Dr. Stanley Kirson)

Prince George's County District (1992)
Robert Ruderman MD, IM, Prince George's County

Western District (1992)
Walid S. Hijab MD, CD, Allegany County

The floor was opened for nominations. Dr. Louis H. Himes, II, Wicomico County, was nominated for the 3-year term in the Eastern District and Dr. Paul E. Pritchett, Charles County, was nominated for the 3-year term in the Southern District. Nominations were declared closed by general consent.

There being no contest of any position, the candidates were declared elected by acclamation.

Bylaws Committee Report

The President advised the members of the House that the "consent calendar" procedure would be used for the report of the Bylaws Committee. Following a review of the issues of the report by Dr. Karl H. Weaver, Chairman of the Bylaws Committee, Items 1 and 8 were extracted for discussion.

Dr. Weaver, on behalf of the Bylaws Committee, moved adoption of bylaw amendments, **Items 2,3,4,5, and 7** of the report, which were **adopted unanimously** as follows:

2. Proposed Bylaw Amendment to Clarify Terms of Office on Council

- Rationale: To more clearly define the term of office of the members of Council by including the term of the representative of the newly established Committee on Specialty Societies.
- Amend Article IV (Officers), Section 6, following the words "Councilors shall hold office for a term of three years," and before the words "or until their successors are elected," by inserting the words "with the exception of the representative of the Committee on Specialty Societies who shall serve for a term of one year,..."

3. Proposed Bylaw Amendment to the AMA Delegation

- Rationale: To clarify the seating of delegates to the AMA by deleting the word "THEIR" in the title.
- Amend Article XI (Committees), Section 6, following the words "AT LEAST TWO OF THE DELEGATES AND" and before the words "ALTERNATES TO THE AMERICAN MEDICAL ASSOCIATION" by deleting the word "THEIR."

4. Proposed Bylaw Amendment to Editorial Board

- Rationale: To more clearly define the responsibilities of the Editorial Board.
- Amend Article XI (Committees), Section 8 (Editorial Board), by inserting the following new Section 8:

Section 8. There shall be an EDITORIAL BOARD of the *Maryland Medical Journal* composed of the Editor, appointed by the Council for a three-year term or until a successor is appointed; an Associate Editor designated by the President from the board members for a three-year term or until a successor is appointed; and six members, two of whom shall be appointed by the President each year for a three-year term. The Board shall review and accept papers for publication in the *Maryland Medical Journal* in accordance with the objectives as approved by Council. The Board shall periodically review its goals/purposes of publication for Council review and approval, and shall report to the Council at appropriate intervals.

5. Proposed Bylaw Amendment to the Committee on Medicine and Religion

- Rationale: To include the appointment of the Chairman by the President.
- Amend Article XI (Committees), Section 18 (Medicine and Religion Committee), following the first sentence, by inserting the words "The President shall designate the Chairman."

7. Proposed Bylaw Amendment to the Public Relations Committee

- Rationale: To include as a function of the committee the responsibility to work with the media in enhancing the public image of the physician.
- Amend Article XI (Committees), Section 30 (Public Relations Committee), in the first sentence, following the words "members shall undertake to" by inserting the words "enhance the image of the physicians;..."

Dr. Weaver, on behalf of the Bylaws Committee, moved adoption of the following bylaw amendment, Item 1 of the report, which after debate, was **rejected** by a vote of 28 in the negative and 19 in the affirmative:

1. Proposed Bylaw Amendment regarding Associate Members

- Rationale: Proposed bylaw amendment to define more clearly the voting rights of associate members of the Faculty.
- Amend Article II (Membership), Section 2(c) (Associate Members), following the words "may be appointed to serve on" and before the words "on committees of the Faculty" by inserting the words "the Faculty's Council, without vote, and... ."

Dr. Weaver, on behalf of the Bylaws Committee, recommended adoption of Item 6 of the report, which, after debate and rejecton of an amendment, was **adopted** by the required 2/3 vote:

6. Proposed Bylaw Amendment to Establish the Peer Review Management Committee

- Rationale: To establish the present Ad Hoc Committee on Peer Review Management as a full standing committee on the Faculty.

- Amend Article XI (Committees), by inserting the following new Section 24, subsequent sections automatically being redesignated:

Section 24. A PEER REVIEW MANAGEMENT COMMITTEE (PRMC) shall consist of not less than nine members and may be selected from nominees submitted by component societies. Appointments shall be based on the nominees' experience on a medical review committee. The Chairman and members shall be appointed by the President. The Chairman or his designee may serve in an ex-officio capacity on the Board of Physician Quality Assurance. It shall be the duty of the committee to receive and record cases referred by the Board of Physician Quality Assurance; to identify the guidelines to be used in conducting reviews; refer cases to the appropriate Med Chi committee, component, specialty society or regional committee; to monitor the status of each case; to review reports received from investigating committees to determine adequacy of the review and the report and either transmit the report to the Board of Physician Quality Assurance or return it to the investigating committee with any inadequacies specified. Further, it shall be the duty of this committee to provide educational programs throughout Maryland to emphasize the elements of peer review; to provide organizational assistance to any review committee in Maryland; and to gather, analyze, and report statistical information annually for use by the Board of Physician Quality Assurance, Med Chi, and component societies in evaluating and upgrading the peer review process.

Item 8 of the Bylaws Committee Report had been recommitted to the Bylaws Committee by the House of Delegates on April 12, 1989. On behalf of the Bylaws Committee, Dr. Weaver moved adoption of the committee's recommendation contained in the report, which, after debate and amendment to the portion of the report pertaining to the Liaison Committee with the Department of Health and Mental Hygiene, Item 8 was adopted by the required 2/3 vote of the House as follows:

8. Proposed Bylaw Amendment to Public Health Committee

- Rationale: To reorganize the Committee on Public Health to empower it to function as the primary committee within Med Chi to evaluate and act upon all social and economic aspects of medical care relating to public health. To accomplish this, the following committees would be redesignated as subcommittees within the auspices of the primary Committee on Public Health:

  Committee on Aids
  Committee on Alcoholism and Chemical Dependency
  Subcommittee on Child and Adolescent Health and Welfare
  Subcommittee on Immunology and Infectious Diseases
  Liaison Committee with the Department of Health and Mental Hygiene
  Committee on Long Term Care and Geriatrics
  Subcommittee on Maternal Health and Welfare
  Committee on Mental Health
  Committee on Occupational Health
  Subcommittee on Sports Medicine

The House of Delegates at its meeting on April 12, 1989 recommitted this proposed bylaw amendment to the Bylaws Committee for further consideration. In the interim, a meeting was held by the Committee on Public Health and their recommendations were submitted to the Bylaws Committee. Following review of this additional information, the Bylaws Committee developed the following motions, each of which will be addressed individually:

(a) The Bylaws Committee rejected the concept of establishing one umbrella Public Health Committee with ten subordinate committees.

(b) For clarification purposes, the Bylaws Committee recommends that the existing structure of the Committee on Public Health be maintained as currently organized with its four subcommittees:

  Subcommittee on Child and Adolescent Health and Welfare
  Subcommittee on Immunology and Infectious Diseases
  Subcommittee on Maternal Health and Welfare
  Subcommittee on Sports Medicine

(c) The following Proposed Bylaw Amendment to the Liaison Committee with the Department of Health and Mental Hygiene is herewith presented:

- Rationale: To clarify this committee's responsibility as focusing on the Medical Assistance Program and not as liaison with the Department of Health and Mental Hygiene as this is the purpose of the Public Health Committee.
- Amend Article XI (Committees), Section 14 (Liaison Committee with the Department of Health and Mental Hygiene) by striking it in its entirety and inserting the following new Section 14:

Section 14. A LIAISON COMMITTEE WITH MEDICAL ASSISTANCE PROGRAM of at least five members shall maintain continuous liaison with the Medical Assistance Program, the payments made under such programs to providers of health care services, and all other facets of operation of this program. It shall act as a consultant to the Medical Assistance Program in evaluating the quality of care, experimental programs involving alternative methods of delivery of care and any other area wherein improvement of health services provided to Medical Assistance patients may be undertaken. The President shall appoint the Chairman and members of the committee.

Resolution 1S/89 - Use of Steriods ADOPTED

Dr. Aubrey Smoot, on behalf of the Reference Committee, moved adoption of the following Resolution 1S/89, which was adopted unanimously by the House:

Resolution 1S/89 - Subject: Condemnation of Use of Anabolic Steroids in Enhancement of Athletic Performance

Whereas, The use of anabolic steroids to enhance athletic performance is fraught with danger to the health of the user;
Whereas, That the use of such steroids creates an unfair competitive advantage and encourages use of these substances by other competitors; and
Whereas, Anabolic steroids can be used safely under medical supervision and have an accepted use in the treatment of several medical conditions, including certain anemias, hereditary angioedema, and breast cancer; therefore, be it
Resolved, That the Medical and Chirurgical Faculty of Maryland hereby universally and unequivocally condemns the use of anabolic steroids to enhance athletic performance;
Resolved, That anabolic steroids be used only under the prescription of a licensed physicians for medically indicated purposes; and be it further
Resolved, That the Medical and Chirurgical Faculty work with the office of the Governor, as well as with the state legislature in all efforts to endorse educational activities aimed at appropriate interested individuals such as sports group administrators, coaches, trainers, parents, and athletes to curb the non-medical use of anabolic steroids.

Resolution 2S/89 - Medicare Care Review, ADOPTED

Dr. Aubrey Smoot, on behalf of the Reference Committee, moved adoption of the following Resolution 2S/89, which was adopted unanimously:

Resolution 2S/89 - Subject: Medical Care Review

Whereas, The physicians of the State of Maryland are under continuous pressures to reduce the average lengths of stay of hospitalized patients, not only by the hospitals, but also from the numerous government agencies;
Whereas, The physicians of the State of Maryland are under continuous surveillance by third-party payors; Medicare, through its PRO, and the State of Maryland through its Medicaid contract;
Whereas, We are living in a litigious society in which any adverse or negative results are continually scrutinized by lawyers specializing in malpractice;
Whereas, The Health Care Financing Administration (HCFA) has devised a system of staging quality problems by levels of severity; and
Whereas, HCFA has labeled the level of severity as "medical mismanagement" whether or not it involves physician mismanagement;
Whereas, HCFA intends to mail letters concerning quality of care directly to the patients which could result in increasing the possibility of litigation; therefore, be it
Resolved, That the Medical and Chirurgical Faculty of Maryland strongly condemns HCFA's system of nomenclature because it would encourage an increase in law suits by *de facto* underwriting of legal decisions without due process of law; and
Resolved, That the Medical and Chirurgical Faculty of Maryland encourages "medical care review" for the purpose of improving the medical care of our state residents, but that this review process be one of education and rehabilitation, rather than the destructive process of encouraging litigation, which it condemns; and be it further
Resolved, That the Medical and Chirurgical Faculty of Maryland which represents all physicians in the State of Maryland and the state-of-the-art of medicine in Maryland, consult with the PRO (Delmarva Foundation for Medical Care) in order to clarify these issues so that the end result would not be to compound the malpractice crisis.

Report on Late Resolution

Dr. Gary Rosenberg, Chairman of Ad Hoc Committee to Review Late Resolution 5A/89, on behalf of the committee, presented the following substitute resolution 5A/89, which, after debate and amendment, was adopted by the required 2/3 vote:

5A/89 - ADOPTED, as Amended

Whereas, There are major forces in the delivery of health care in Maryland, which are denying the patient the right to free choice; and
Whereas, The Federal Government has expanded its role in health care delivery by expanding the interpretations of the intent of the laws, without benefit of consultation with those delivering the care; and
Whereas, A steady decline in the quality of health care adversely affecting eligible Medicare enrollees is anticipated, while the costs are being caused to rise due to increasing administrative expenditures; therefore be it
Resolved, That the Medical and Chirurgical Faculty of Maryland seek the cooperation and support of other statewide professional associations involved with the medical care system, such as the Maryland Hospital Association, the Maryland Nursing Association, and other statewide professional organizations, in order to have greater impact in shaping the medical care system than an individual group could have acting alone; and
Resolved, That these efforts be directed toward enabling physicians and hospitals to continue to deliver quality medical care and ensure access to that care; and, be it further
Resolved, That the Medical and Chirurgical Faculty of Maryland maintain communication with these professional groups in order to foster effective cooperation on issues of common concern.

The Secretary read Resolution 1A/79 with a staff recommendation that it be reaffirmed. Resolution 1A/79 was reaffirmed as follows:

Resolution 1A/79 REAFFIRMED

Resolved, That the House of Delegates of the Medical and Chirurgical Faculty goes on record as urging all health insurance carriers doing business in this State to provide coverage for inpatient, residential and outpatient treatment of alcoholism as a basic benefit in its contracts; and be it
Resolved, That, although it is recognized benefits for alcoholism treatment cannot become a part of the basic benefit insurance package immediately, health insurance carriers are urged to aggressively market the alcoholism treatment benefit option in all policies currently sold in Maryland; and be it
Resolved, That all health insurance carriers be urged to change their procedures so that alcoholism is underwritten as a medical condition;

The Secretary read Resolution 1S/79 with a staff recommendation that it be reaffirmed. Resolution 1S/79 was reaffirmed as follows:

Resolution 1S/79 REAFFIRMED

Resolved, That the Medical and Chirurgical Faculty goes on record as supporting, in principle, any Department of Health and Mental Hygiene proposal to re-allocate Medical Assistance Program funds so as to increase physician reimbursement to the usual, customary, and reasonable rate of private physicians so the system will be competitive and result in total reimbursement, not exceeding the total budgeted dollars.

The Secretary read Resolution 4A/82 with a staff recommendation that it be reaffirmed. Resolution 4A/82 was reaffirmed and reads as follows:

Resolution 4A/82 REAFFIRMED

Resolved, That the House of Delegates of the Medical and Chirurgical Faculty opposes the elimination of these loan programs.

The Secretary read Resolution 1S/82 with a staff recommendation that it be reaffirmed. On vote, Resolution 1S/82 was reaffirmed as follows:

Resolution 1S/82 REAFFIRMED

Resolved, That the Medical and Chirurgical Faculty urges that a program of providing Hepatitis B vaccine be instituted in all medical facilities in Maryland for those individuals at high risk; and be it further
Resolved, That all such institutions in Maryland be notified of this action.

The Secretary read Resolution 2S/82 with a staff recommendation that it be reaffirmed. Resolution 2S/82 was reaffirmed as follows:

Resolution 2S/82 REAFFIRMED

Resolved, That utilization review should be directed toward detecting and eliminating unnecessary periods of hospitalization and should not serve the function of rationing necessary health care when insurers - governmental or otherwise - fail to fulfill their financial obligations; and, be it further
Resolved, That mandatory preadmission authorization is opposed since it creates yet another level of bureaucracy which will create additional expense and shows little or no evidence of lessening health care costs.

The Secretary read a resolution (1983 unnumbered) with a staff recommendation that it be reaffirmed. The resolution was reaffirmed as follows:

1983 (Unnumbered) Resolution REAFFIRMED

Resolved, That the House of Delegates adopt a policy requiring that a review of all policy decisions be undertaken ten years after adoption of such policy to assure it is still current, should be revised, should be repealed, or that no action is necessary because the objectives have already been accomplished; and
(Revised by motion adopted by House of Delegates on 9/24/88 for more frequent review of resolutions.)

The Secretary read a Resolution (1984 unnumbered) with a staff recommendation that it be reaffirmed.

1984 (Unnumbered) Resolution - NO ACTION

Resolved, That, in recognition of 25 years of service, the Medical and Chirurgical Faculty place and accumulate funds for a Medical Scholarship Program to be designated The John Sargeant Medical Scholarship which will become operational at the time of Mr. Sargeant's retirement.

Dr. George Malouf, Chairman of the Ad Hoc Building Committee, stated that upon the death of Mr. Sargeant, his widow had requested that the funds be donated to the Building Fund, and moved that no action be taken on this resolution. The motion to take no action on the resolution was adopted unanimously.

The Secretary read Resolution 1A/84 with a staff recommendation that it be reaffirmed. Resolution 1A/84 was reaffirmed as follows:

Resolution 1A/84 REAFFIRMED

Resolved, That members of the Medical and Chirurgical Faculty of the State of Maryland pledge themselves to ensure the highest quality of medical care to all Maryland citizens at a cost that is reasonable and appropriate while always remaining vigilant to every opportunity for containment of health care costs, as well as for instances where courtesy and charity can be given in a dignified and appropriate manner.

Though "no action" had been recommended on Resolution 1S/84, upon motion by Dr. Charles Ligon of Montgomery County, the second resolving clause of Resolution 1S/84 was reaffirmed:

Resolution 1S/84 REAFFIRMED

Resolved, That horseback riders be encouraged to wear headgear at all times when they are involved in this activity.

The Secretary read Resolution 2S/84 with a staff recommendation that it be affirmed. On vote, Resolution 2S/84 was reaffirmed as follows:

Resolution 2S/84 REAFFIRMED

Resolved, That all Maryland physicians pledge their continuance of the highest quality of medical care to all patients.

Dr. Robert Ruderman, on behalf of the Prince George's County Medical Society, introduced a resolution, which was referred to the Legislative Committee for consideration:

Resolution REFERRED

Whereas we can now recognize that among our biggest adver-

saries in health care delivery are the insurance companies themselves;
Whereas, These companies have consistently operated without controls, frequently distorting their actual earnings by adding and subtracting coverage, so that actual comparisons are impossible;
Whereas, Full understanding by the patients of coverage is often impossible due to technical terminology; and
Whereas, Demands are often made on physicians, by them with the sole purpose of delaying or denying the coverage; therefore be it
Resolved, That the Med Chi Council go on record as favoring an omnibus insurance bill that would include:
1. Requirement that Insurance Companies pay for mandated second opinions and other mandated services.
2. Establishing minimum standards of education and training for medical claim technicians.
3. Establishing a "truth in insuring" law that would require all benefits and exclusion be outlined in nonlegal vernacular form in both English and Spanish with co-pays and deductible clearly defined.
4. Requirement that companies clearly state incentives to physicians who save the company money.
5. Requirement that insurance companies pay for laboratory testing by a noncontractual laboratory or physician if that lab or physician is willing to accept the same payment as the contracted lab.
6. A penalty to any insurance broker in the State who sells insurance of a company not approved by the Insurance Commission.
7. Requirement for a Bond by a company selling malpractice or liability insurance, which would be kept it a special fund and be surrendered if the company were to decide to leave the State under circumstances not approved by the Insurance Commission.
8. Establishing a medical advisory board to the Workman's Compensation Board that would recommend changes to the present and future policies concerning disability, professional compensation, etc.; and be it further
Resolved, That this resolution be sent to Governor William Donald Schaefer to show Med Chi's commitment to excellence in health care.

Dr. Robert Ruderman, on behalf of the Prince George's County Medical Society introduced a resolution, which after a lengthy debate and several motions to amend, a motion was adopted by the required 2/3 vote to refer the resolution to the Legislative Committee. It was recommended that the Legislative Committee modify the inflammatory language in the resolution, which reads as follows:

Resolution REFERRED

Whereas, Medicine has traditionally felt a moral obligation to care for indigent people;
Whereas, We continue this tradition even at the present time, despite a lowering of Medicaid payments to hospitals and practitioners;
Whereas, Many HMO type insurance companies were given outright grants by the Federal Government to start and successfully continue these alternative forms of care; and
Whereas, Taxpayer money was used in these grants, without any payback expected to the government; therefore be it
Resolved, That the HMO insurance companies assume the moral responsibility of sharing in the care of the indigent population, by insuring some people without charging premiums;
Resolved, That the indemnity companies also share in this responsibility in order to thank the State of Maryland for the opportunity to reap larger profits by doing business here; and be it further
Resolved, That this resolution be sent to Governor William Donald Schaefer to demonstrate the commitment of the Medical and Chirurgical Faculty of the State of Maryland by developing ways and means for the Insurance Industry and others to help share the burden of indigent care in the State of Maryland.

Adjournment

There being no further business to come before the House of Delegates, without objection, the House adjourned *sine die* at 11:37 a.m.

Delegation to the AMA House of Delegates
Annual Meeting June 18-22, 1989

Mr. President and Members of the House of Delegates:

The AMA House of Delegates met in Chicago and seated 435 delegates:

347	delegates representing state medical associations
78	delegates representing national medical specialty societies
10	section and service delegates representing medical students, medical schools, resident physicians, hospital medical staffs, young physicians, Army, Navy, Air Force, United States Public Health Service, and the Veterans Administration

The applications of two specialty societies were approved by the House at this meeting:
1. American Society of Hematology
2. Association of University Radiologists

Address of the President

AMA President, James E. Davis MD likened the medical profession to a symphony orchestra. He said "the ultimate success of American medicine depends on all physicians in America realizing that—as diverse as we are individually, by specialty, and in terms of the many different ways we serve our communities back home—we must work together." Dr. Davis reiterated his call for physicians to make a commitment to community service. He observed that the American people expect physicians to work together for their benefit. He called the AMA the most effective guardian of the public health and the only "maestro" with the capability of pulling American medicine together.

Address of Louis W. Sullivan MD, Secretary, Department of Health and Human Services

In his first appearance before the AMA House of Delegates, Louis W. Sullivan MD, the new Secretary for Health and Human Services, called for "nothing less than a reformation of the American health care system as we know it today." He said the Administration's views on physician payment reform under Medicare included support for a three-part framework: (1) a resource-based fee schedule; (2) an expenditure target for Medicare physician services; and (3) beneficiary protections. He said that fee schedule must be linked to a "volume-control mechanism" such as an expenditure target.

Secretary Sullivan called on physicians to become involved in seeking solutions to America's health care problems. He urged that:

- "We stress the individual's increasing power and primary responsibility for maintaining his or her own health, through health promotion and disease prevention strategies."
- "Through research on the effectiveness of the medical procedures in our therapeutic armamentarium, find out what works and discard that which does not."
- "As a compassionate society, we must address the disparate health status of the poor and our minority citizens."
- "We must work together to find affordable ways to provide health insurance for our 37 million uninsured citizens."

Remarks of James H. Sammons MD, Executive Vice-President

In a rare departure from custom, the Executive Vice-President rose to introduce the EVP Report and address the growing challenge to the American health care system. He said, "If there is anyone who believes that rationing of health care cannot happen in this country, I would tell them to pay attention to what is already happening in Washington this very day. The PPRC, the Congress, and the Bush Bureaucracy are proposing expenditure targets, and we all know what expenditure targets have given to Canadians: (1) long waits for necessary surgery, (2) degrading conditions for elderly hospital patients, and (3) yes, in some cases even premature deaths while waiting in line for an operation." In a call to action, Dr. Sammons urged the House members to call their elected representatives and tell them how expenditure targets (ETs) will affect their constituents. Calling ETs "the biggest challenge the medical profession has had to deal with in our recent memories," Dr. Sammons promised an all-out campaign to warn the American people that expenditure targets mean rationing.

The elections for AMA officers, trustees, and council members were held Wednesday, June 21. Following are the major issues considered at the meeting:

Expenditure Targets As the House Ways and Means Committee began considering expenditure targets while the House was in session, this issue dominated the delegate's attention throughout the meeting. Members of the House and the AMA Auxiliary placed hundreds of telephone calls to their elected representatives and to the Administration objecting to this new proposal to control costs.

Expenditure targets are government-set expenditure goals for total physician services under Medicare Part B. If the targets are exceeded, Medicare physician payment updates to reflect increases in practice costs and changes in patient access will be adjusted downward accordingly across the board.

The purpose of expenditure targets is to reduce the amount of physician services the government pays for. They are designed and justified, by PPRC and others, on the need to reduce the federal deficit.

The concept of targets is wrong in principle. They

will be unworkable and unfair in practice. The targets are said to take into account increased demand and other factors that would increase costs. But it is fatally naive to assume the targets will do that.

The *government*—not the medical profession—will establish the targets. The government's stated first concern for Medicare is to reduce spending to reduce the deficit. The government's record in setting fair reimbursement levels is uniformly bad. In 1984 fees were frozen, in 1986 MAACs were implemented. Since Medicare was established, the MEI has never fully reflected the actual increases in physician costs. There is no basis to believe the government will not continue to be arbitrary about reimbursement levels.

Even if the government were committed to fair targets and had a fair process for physician negotiation and input (there is none proposed), targets cannot be established scientifically, either before or after the services are provided. There simply is no way to measure or prove appropriate increases in demand or appropriate increases in costs from technological advances. The targets will inevitably be arbitrarily low as health care spending competes with other government priorities. That is the experience in Canada and every other country that has capped or targeted government health care expenditures.

After lengthy discussion, the House adopted the following substitute resolution on the issue:

> RESOLVED, That the American Medical Association reaffirm its willingness to participate in efforts to control the cost of Medicare in a manner that preserves the quality and availability of health care to Medicare recipients; and be it further
>
> RESOLVED, That the AMA reaffirms its position that the Medicare program establish actuarially sound financing of benefits as stated in Board of Trustees Report MM (A-86); and be it further
>
> RESOLVED, That the AMA urge Congress to incorporate the following considerations when applying budgetary controls to Medicare in place of Expenditure Targets:
>
> (a) Assure a high priority to health care for Medicare patients in relation to other programs when allocating federal funds.
>
> (b) Given Medicare's finite resources, develop a mechanism to channel those resources to those patients with greater financial need and to require a proportionately larger financial contribution by the more affluent toward their own health care.
>
> (c) Reduce the cost of defensive medicine (approximately $20 billion a year) caused by the present tort system.

Covering the Uninsured The House considered a Board report and three resolutions dealing with providing health insurance to the uninsured. After extended debate, the House adopted an amended version of the Board report that recommends that the AMA:

1. Endorse the concept of a phased-in requirement that employers (limited initially to larger employers) provide health insurance coverage within the private sector for all full-time employees, with coverage expanding over several years and with a program of diminishing tax credits or other incentives to avoid adverse effects on employers;
2. Continue to study all approaches to providing health services for the uninsured and work with business groups to develop approaches that are best suited to the needs of small employers and report to the House of Delegates at the 1989 Interim Meeting; and
3. In conjunction with other organizations begin the development of a package of basic health benefits.

Misleading Explanation of Benefits Language The House filed a report of the Council on Medical Service that described the efforts of the Council to develop accurate and clear explanation of benefits language for use by third-party payors.

The House also adopted the following additional resolutions:

- that the AMA continue to seek action that will direct HCFA to provide to both physicians and beneficiaries on all Medicare claims (whether assigned or nonassigned) a copy of the Explanation of Medicare Benefits in language easily understandable to physicians and patients.
- that the AMA seek to remove, on the Explanation of Medicare Benefits sent to patients of Medicare nonparticipating physicians, all statements regarding the participation status of the physician and the alleged benefits associated with the assignment of claims from seeing participating physicians.

Medicare Reimbursement, Geographical Differences The House adopted as amended a Council on Medical Service report that described current AMA activities to improve rural health care and to remedy geographic physician payment inequities under Medicare. The report recommended setting a floor on prevailing charges for all services at 80 percent of the national average prevailing charge for those services.

In related actions, the House called on the AMA to:

- support elimination of most Medicare reimbursement differentials between urban and rural medical care and that AMA inform the Congress of the impact of such differentials on the rural population.
- reaffirm its policy that geographic variations under a Medicare payment schedule reflect only valid and demonstrable differences in physician practice costs, with further adjustments as needed to remedy demonstrable access problems in specific geographic areas.

Resource-Based Relative Value Scale for Physician Services The House amended and then adopted a Board report that provides an update on recent events involving the RBRVS and calls on the AMA to:

1. reaffirm its support for an indemnity payment schedule.

2. support reasonable attempts to remedy geographic payment inequities that do not conflict with AMA support for an RBRVS-based indemnity system.

3. continue to seek implementation of an RBRVS-based indemnity payment system upon the expansion, correction, and refinement of the RBRVS.

4. oppose any efforts to link acceptance of an RBRVS with any proposal that is counter to AMA policy, such as expenditure targets and mandatory assignment.

5. continue to oppose the arbitrary and unwarranted use of so called "overpriced procedure" reductions as part of the fiscal year 1990 budgetary process, the use of data generated by the yet-to-be-completed Harvard RBRVS study to determine such payment cuts, and especially, the use for this purpose of RBRVS data for specialties whose RBRVS results are being restudied as part of Phase II of the RBRVS study.

In a related action, the House also adopted a resolution that called on the AMA:

- to develop and aggressively seek Congressional sponsorship and support for federal legislation that would allow AMA and the state medical associations, on behalf on physicians, to negotiate payment schedules on federal and state policies respectively, impacting on physician reimbursement.

Strengthening the US Health Care System The Board of Trustees announced a major initiative involving the commitment of substantial resources to ensure that the superiority of the US health care system is maintained. The initiative also will include significant resources to see that the public and others are fully aware of the advantage of US medicine.

Key programs include Medicaid expansion, coverage for the uninsured, and Medicare reform.

The Board report concluded, "It is not an overstatement to emphasize that American medicine is at a crossroads, with one road leading to government controls, rationing of care, and other objectionable results inherent in a nationalized system and the other leading to a strengthened US system preserving all of the advantages that mark the American system as being the best worldwide."

Study of the Canadian Health Care System The Board presented an evaluation of the Canadian health care system that concluded:

1. while the Canadian system has many positive features, it appears to be poorly suited to postindustrial societies.

2. while costs might be reduced, the centralized controls required would make it an unsatisfactory model to be followed by the United States.

Medicare Denials of Payment for Substandard Care Ten resolutions were submitted pertaining to the controversial proposed HCFA regulations on "Denial of Payment for Substandard Quality Care and Review of Beneficiary Complaints."

The House adopted a substitute resolution calling on the AMA to:

1. seek withdrawal of the proposed rule

2. use all available options, including possible legal action, to prevent further implementation until due process considerations are addressed

3. assure that quality of care decisions under these regulations be made by identifiable PRO physician reviewers, based on their clinical experience and judgment rather than reliance on mandated written criteria

4. assure that PRO physician reviewers making a quality denial be required to consult with a physician in the same specialty and practice situation before final action on only quality denial.

National Practitioner Data Bank Four resolutions addressed a growing concern with the development of the National Practitioner Data Bank project.

A substitute resolution was adopted that contained several directives:

1. That the American Medical Association request a modification of the National Practitioner Data Bank requirements so that settlements and judgments of less than $30,000 are not reported or recorded;

2. That reports, other than licensure revocation, in the data bank be purged after five years;

3. That proctoring of physicians for the purpose of investigation not be reported;

4. That physicians not be required to turn over copies of their data bank file to any third party not authorized direct access to the data bank;

5. That the AMA seek to assure that any physician's statement included in the data bank file automatically accompany any adverse report about that physician in distributions from the data bank;

6. That the AMA, in addition to publishing articles in *AMNews*, develop additional educational materials as appropriate for physicians to understand the implications of the National Practitioner Data Bank.

Medicare ICD-9-CM Coding The Catastrophic Coverage Act of 1988 contained a diagnostic coding requirement that carries a civil money penalty provision for failure to utilize ICD-9-CM coding. The House adopted a substitute resolution that calls on the AMA to:

1. support legislation to repeal or substantially ameliorate the threat of federal civil money penalty liability for failure to utilize ICD-9-CM and DSM 3R code in filing Medicare claims;

2. seek amendments to the quasicriminal Medicare civil money penalty process to providing to those charged with civil offenses the same right now available to defendants in criminal proceedings;

3. make every effort to assure that HCFA's implementation of the coding requirement be undertaken with a view to minimizing compliance difficulties to physicians and their office staff;

4. review all other Medicare civil monetary penalty provisions, assess the reasonableness of these fines and the process available to physicians to challenge civil

fines levied against them, and report its findings and recommendations to the House of Delegates at the 1989 Interim Meeting;

5. request Congress to repeal the ICD-9-CM coding requirement for physician services under Medicare.

Physician Involvement in Joint Ventures The House adopted a Board report that describes strong association policy that patients can and do benefit from referral to an "owned" facility as the facility may be the most appropriate entity to provide the care needed in terms of quality of care, price, and convenience. The report also indicated that the AMA is in the process of an all out legislative effort to prevent passage of this proposal.

Clean Air The House adopted a resolution asking the AMA to join with various governmental bodies, state and local medical societies, and other organizations to achieve a comprehensive national policy and program to address the adverse health effects from environmental pollution factors.

Physician Collective Negotiation The House adopted a report describing the establishment of the Physicians Negotiation Advisory Office within the AMA. It outlined AMA's activities related to antitrust issues as well as collective negotiation matters.

Restriction on Assault Weapons The House adopted a substitute resolution calling on the AMA to support appropriate legislation that would restrict the sale and private ownership of large clip, high-rate-of-fire, automatic, and semi-automatic firearms.

AIDS At the 1987 Annual Meeting, the House adopted its landmark AIDS policy that provided physicians with a coherent, comprehensive response to the AIDS epidemic. Given the complexity of AIDS-related issues, advances in the detection of viral infection, and the changing nature of the AIDS epidemic, the House referred to 10 resolutions to the Board and asked the Board for an updated policy report on AIDS at the 1989 Interim Meeting.

Tobacco Use The House continued its strong efforts to achieve a smoke-free society by taking action to:

1. Advocate that all American hospitals ban tobacco use by January 1, 1991.

2. Urge physicians to prohibit smoking and use of tobacco products in their offices.

3. Work toward legislation and policies to promote a ban on smoking and use of tobacco products in hospitals, health care institutions and educational institutions (including medical schools).

4. Develop and disseminate model language to Administrators of US hospitals and the membership of the Hospital Medical Staff Section of the AMA, to emphasize and facilitate the importance of a smoke-free hospital environment.

5. Direct the AMA commissioners to the Joint Commission to pursue with representatives of AHA as a matter of high priority, the implementation of these or incorporation of the model language.

In other actions on tobacco use, the House voted to:

- study methods and develop legislation to limit access of individuals under 21 years of age to tobacco products
- recognize and condemn the targeting of advertisements for cigarettes and other tobacco products toward children, minorities, and women
- identify gaps, if any, in existing materials and programs to train physicians and medical students in the behavior modification skills necessary to successfully counsel patients to stop smoking.

Bylaws

Mr. President and Members of the House of Delegates:

The Bylaws Committee recommends the following bylaw amendments to the House of Delegates for its consideration:

1. Proposed Bylaw Amendment Regarding Associate Members

- Rationale: Proposed bylaw amendment to define more clearly the voting rights of associate members of the Faculty.
- Amend Article II (Membership), Section 2(c) (Associate Members), following the words "may be appointed to serve on" and before the words "on committees of the Faculty" by inserting the words "the Faculty's Council, without vote, and. . . ."

CURRENT BYLAW
[ ] indicates deletion

(c) Associate members shall have the right to attend and participate in General Meetings; subscribe to the *Maryland Medical Journal*; have the privileges of the building, the reading room, the use of the books, and to hold such meetings in the building as meet with the approval of the Executive Committee. They shall not have the right to vote or hold office in their component societies, [but] may be appointed to serve on committees of the Faculty, except the Committee on Physician/Patient Relations, the Committee on Physician Rehabilitation, the Committee on Peer Review, and the Committee on Drugs. Those associate members who are Doctors of Medicine engaged in the clinical practice of medicine shall have the right of physician's defense.

PROPOSED BYLAW
CAPS indicate change

(c) Associate members shall have the right to attend and participate in General Meetings; subscribe to the *Maryland Medical Journal*; have the privileges of the building, the reading room, the use of the books, and to hold such meetings in the building as meet with the approval of the Executive Committee. They shall not have the right to vote or hold office in their component societies. THEY may be appointed to serve on THE FACULTY'S COUNCIL, WITHOUT VOTE, AND on committees of the Faculty, except the Committee on Physician/Patient Relations, the Committee on Physician Rehabilitation, the Committee on Peer Review, and the Committee on Drugs. Those associate members who are Doctors of Medicine engaged in the clinical practice of medicine shall have the right of physician's defense.

The Bylaws Committee recommends adoption of this proposed bylaw amendment.

2. Proposed Bylaw Amendment to Clarify Terms of Office on Council

- Rationale: To more clearly define the term of office of the members of Council by including the term of the representative of the newly established Committee on Specialty Societies.
- Amend Article IV (Officers), Section 6, following the words "Councilors shall hold office for a term of three years," and before the words "or until their successors are elected," by inserting the words "with the exception of the representative of the Committee on Specialty Societies who shall serve for a term of one year, . . . "

CURRENT BYLAW

Section 6. *ELECTIVE OFFICERS EXCEPT COUNCILORS* shall hold office for a term of one year or until their successors are elected. Councilors shall hold office for a term of three years or until their successors are elected, provided that they may not serve more than two consecutive terms. Elective officers, except councilors, shall assume their duties at the close of the annual session one year after their election, except that the President-elect shall assume that office at the close of the annual session at which he is elected. Councilors in each newly elected annual class shall assume their duties at the close of the annual session immediately preceding which they were elected.

PROPOSED BYLAW
CAPS indicate change

Section 6. *ELECTIVE OFFICERS EXCEPT COUNCILORS* shall hold office for a term of one year or until their successors elected. Councilors shall hold office for a term of three years, WITH THE EXCEPTION OF THE REPRESENTATIVE OF THE COMMITTEE ON SPECIALTY SOCIETIES WHO SHALL SERVE FOR A TERM OF ONE YEAR or until their successors are elected, provided that they may not serve more than two consecutive terms. Elective officers, except councilors, shall assume their duties at the close of the annual session one year after their election, except that the President-elect shall assume that office at the close of the annual session at which he is elected. Councilors in each newly elected annual class shall assume their annual duties at the close of session immediately preceding which they were elected.

The Bylaws Committee recommends adoption of this proposed bylaw amendment.

3. Proposed Bylaw Amendment to the AMA Delegation

- Rationale: To clarify the seating of delegates to the AMA by deleting the word "THEIR" in the title.
- Amend Article XI (Committees), Section 6, following the words "AT LEAST TWO OF THE DELEGATES AND" and before the words "ALTERNATES TO THE AMERICAN MEDICAL ASSOCIATION" by deleting the word "THEIR."

CURRENT BYLAW
[ ] indicates deletion

Section 6. *AT LEAST TWO OF THE DELEGATES AND [THEIR] ALTERNATES TO THE AMERICAN MEDICAL ASSOCIATION* shall be nominated and elected in the same manner and at the same time as that provided for the elective officers. Their terms shall begin on January 1 of the year following their election and they shall serve for a term of three years or until their successors are elected.

PROPOSED BYLAW

Section 6. *AT LEAST TWO OF THE DELEGATES AND ALTERNATES TO THE AMERICAN MEDICAL ASSOCIATION* shall be nominated and elected in the same manner and at the same time as that provided for the elective officers. Their terms shall begin on January 1 of the year following their election and they shall serve for a term of three years or until their successors are elected.

They Bylaws Committee recommends adoption of this proposed bylaw amendment.

4. Proposed Bylaw Amendment to Editorial Board

- Rationale: To more clearly define the responsibilities of the Editorial Board.
- Amend Article XI (Committees), Section 8 (Editorial Board), by inserting the following new Section 8:

CURRENT BYLAW
[ ] indicates deletion

[Section 8. There shall be an *EDITORIAL BOARD* composed of the Editor of the *Maryland Medical Journal* and six members, two of whom shall be appointed by the President each year for a three-year term.]

PROPOSED BYLAW
CAPS indicate change

SECTION 8. THERE SHALL BE AN *EDITORIAL BOARD* OF THE *MARYLAND MEDICAL JOURNAL* COMPOSED OF THE EDITOR, APPOINTED BY THE COUNCIL FOR A THREE-YEAR TERM OR UNTIL A SUCCESSOR IS APPOINTED; AN ASSOCIATE EDITOR DESIGNATED BY THE PRESIDENT FROM THE BOARD MEMBERS FOR A THREE-YEAR TERM OR UNTIL A SUCCESSOR IS APPOINTED; AND SIX MEMBERS, TWO OF WHOM SHALL BE APPOINTED BY THE PRESIDENT EACH YEAR FOR A THREE-YEAR TERM. THE BOARD SHALL REVIEW AND ACCEPT PAPERS FOR PUBLICATION IN THE *MARYLAND MEDICAL JOURNAL* IN ACCORDANCE WITH THE OBJECTIVES AS APPROVED BY COUNCIL. THE BOARD SHALL PERIODICALLY REVIEW

ITS GOALS/PURPOSES OF PUBLICATION FOR COUNCIL REVIEW AND APPROVAL, AND SHALL REPORT TO THE COUNCIL AT APPROPRIATE INTERVALS.

The Bylaws Committee recommends adoption of this proposed amendment.

5. Proposed Bylaw Amendment to the Committee on Medicine and Religion

- Rationale: To include the appointment of the Chairman by the President.
- Amend Article XI (Committees), Section 18 (Medicine and Religion Committee), following the first sentence, by inserting the words "The president shall designate the chairman."

CURRENT BYLAW

Section 18. A *COMMITTEE ON MEDICINE AND RELIGION* shall be appointed by the President to consist of not less than six members. It shall be charged with maintaining liaison and effective lines of communication between physicians and clergymen leading to the most effective care and treatment of the patient and his family. It shall also endeavor to assist medical schools and nursing schools in their educational endeavors, and shall be available to theological seminaries for similar assistance--all within the area of medicine and religion.

PROPOSED BYLAW
CAPS indicate change

Section 18. A *COMMITTEE ON MEDICINE AND RELIGION* shall be appointed by the President to consist of not less than six members. THE PRESIDENT SHALL DESIGNATE THE CHAIRMAN. It shall be charged with maintaining liaison and effective lines of communication between physicians and clergymen leading to the most effective care and treatment of the patient and his family. It shall also endeavor to assist medical schools and nursing schools in their educational endeavors, and shall be available to theological seminaries for similar assistance--all within the area of medicine and religion.

The Bylaws Committee recommends adoption of this proposed bylaw amendment.

6. Proposed Bylaw Amendment to Establish the Peer Review Managment Committee

- Rationale: To establish the present Ad Hoc Committee on Peer Review Management as a full standing committee of the Faculty.
- Amend Article XI (Committees), by inserting the following new Section 24, subsequent sections automatically being redesignated:

Section 24. A *PEER REVIEW MANAGEMENT COMMITTEE (PRMC)* shall consist of not less than nine members and may be selected from nominees submitted by component societies. Appointments shall be based on the nominees' experience on a medical review committee. The Chairman and members shall be appointed by the President. The Chairman or his designee may serve in an ex-officio capacity on the Board of Physician Quality Assurance. It shall be the duty of the committee to receive and record cases referred by the Board of Physician Quality Assurance; to identify the guidelines to be used in conducting reviews; refer cases to the appropriate Med Chi committee, component, specialty society or regional committee; to monitor the status of each case; to review reports received from investigating committees to determine adequacy of the review and the report and either transmit the report to the Board of Physician Quality Assurance or return it to the investigating committee with any inadequacies specified. Further, it shall be the duty of this committee to provide educational programs throughout Maryland to emphasize the elements of peer review; to provide organizational assistance to any review committee in Maryland; and to gather, analyze, and report statistical information annually for use by the Board of Physician Quality Assurance, Med Chi, and component societies in evaluating and upgrading the peer review process.

The Bylaws Committee recommends adoption of this proposed bylaw amendment.

7. Proposed Bylaw Amendment to the Public Relations Committee

- Rationale: To include as a function of the committee the responsibility to work with the media in enhancing the public image of the physician.
- Amend Article XI (Committees), Section 30 (Public Relations Committee), in the first sentence, following the words "members shall undertake to" by inserting the words "enhance the image of the physicians;. . ."

CURRENT BYLAW

Section 30. A *PUBLIC RELATIONS COMMITTEE* of at least five members shall undertake to supply speakers to organizations requesting them on subjects relating to the practice of medicine; undertake such methods as it deems advisable to inform and instruct the public generally on subjects related to the practice of medicine; issue to the press and other media of public information releases relating to the meetings, actions and activities of the Faculty, with the advice and approval of the President or Executive Director, and serve in an advisory capacity to the Auxiliary. Its chairman shall be appointed by the President. The Maryland State Dental Association shall have the right to elect one associate member of the committee with voice but without vote.

PROPOSED BYLAW
CAPS indicate change

Section 30. A *PUBLIC RELATIONS COMMITTEE* of at least five members shall undertake to ENHANCE THE IMAGE OF PHYSICIANS; to supply speakers to organizations requesting them on subjects relating to the practice of medicine; undertake such methods as it deems advisable to inform and instruct the public generally on subjects related to the practice of medicine; issue to the press and other media of public information releases relating to the meetings, actions and activities of the Faculty, with the advice and approval of the President or Executive Director, and serve in an advisory capacity to the Auxiliary. Its chairman shall be appointed by the President. The Maryland State Dental Association shall have the right to elect one associate member with voice but without vote.

The Bylaws Committee recommends adoption of this proposed bylaw amendment.

8. Proposed Bylaw Amendment to Public Health Committee

- Rationale: To reorganize the Committee on Public Health to empower it to function as the primary committee within Med-Chi to evaluate and act upon all social and economic aspects of medical care relating to public health. To accomplish this, the following committees would be redesignated as subcommittees within the auspices of the primary Comittee on Public Health:

  Committee on AIDS
  Committee on Alcoholism and Chemical Dependency
  Subcommittee on Child and Adolescent Health and Welfare
  Subcommittee on Immunology and Infectious Diseases
  Liaison Committee with the Department of Health and Mental Hygiene
  Committee on Long Term Care and Geriatrics
  Subcommittee on Maternal Health and Welfare
  Committee on Mental Health
  Committee on Occupational Health
  Subcommittee on Sports Medicine

The House of Delegates at its meeting on April 12, 1989 recomitted this proposed bylaw amendment to the Bylaws Committee for further consideration. In the interim, a meeting was held by the Public Health Committee and their recommendations were submitted to the Bylaws Committee. Following review of this additional information, the Bylaws Committee developed the following motions, each of which will be addressed individually:

(a) The Bylaws Committee rejected the concept of establishing one umbrella Public Health Committee with 10 subordinate committees.

(b) For clarification purposes, the Bylaws Committee recommends that the existing structure of the Public Health Committee be maintained as currently organized with its four subcommittees:

  Subcommittee on Child and Adolescent Health and Welfare
  Subcommittee on Immunology and Infectious Diseases
  Subcommittee on Maternal Health and Welfare
  Subcommittee on Sports Medicine.

(c) The following Proposed Bylaw Amendment to the Liaison Committee with the Department of Health and Mental Hygiene is herewith presented:

- Rationale: To clarify this committee's responsibility as focusing on the Medical Assistance Program and not liaisoning with the Department of Health and Mental Hygiene as this is the purpose of the Public Health Committee.
- Amend Article XI, Section 14 (Liaison Committee with the Department of Health and Mental Hygiene) by striking it in its entirety and inserting the following new Section 14:

OLD
[ ] indicates deletion

[Section 14. A *LIAISON COMMITTEE WITH THE DEPARTMENT OF HEALTH AND MENTAL HYGIENE* consisting of not less than 7 members shall be appointed by the President who shall designate the Chairman. Its main responsibility will be to maintain continuous liaison with the Department, particularly as it involves the Medical Assistance Program, the payments made under such programs to providers of health care services, and all other facets of operation of this program. It shall act as a consultant to the Department in evaluating the quality of care, experimental programs involving alternate methods of delivery of care and any other area wherein improvement of health services provided to medical assistance patients may be undertaken.]

NEW
CAPS indicate change

SECTION 14. A *LIAISON COMMITTEE WITH MEDICAL ASSISTANCE PROGRAM* CONSISTING OF FIVE MEMBERS SHALL MAINTAIN CONTINUOUS LIAISON WITH THE MEDICAL ASSISTANCE PROGRAM, THE PAYMENTS MADE UNDER SUCH PROGRAMS TO PROVIDERS OF HEALTH CARE SERVICES, AND ALL OTHER FACETS OF OPERATION OF THIS PROGRAM. IT SHALL ACT AS A CONSULTANT TO THE MEDICAL ASSISTANCE PROGRAM IN EVALUATING THE QUALITY OF CARE, EXPERIMENTAL PROGRAMS INVOLVING ALTERNATIVE METHODS OF DELIVERY OF CARE AND ANY OTHER AREA WHEREIN IMPROVEMENT OF HEALTH SERVICES PROVIDED TO MEDICAL ASSISTANCE PATIENTS MAY BE UNDERTAKEN. THE PRESIDENT SHALL APPOINT THE CHAIRMAN AND MEMBERS OF THE COMMITTEE.

The Bylaws Committee recommends adoption of this proposed bylaw amendment.

This concludes the report of the Bylaws Committee.

Reference

Mr. President and Members of the House of Delegates:

The Reference Committee met on Thursday, August 10, 1989 to consider two resolutions which are herewith presented for your consideration:

Resolution 1S/89 - Subject: Condemnation of Use of Anabolic Steroids in Enhancement of Athletic Performance

Whereas, The use of anabolic steroids to enhance athletic performance is fraught with danger to the health of the user;
Whereas, That the use of such steroids creates an unfair competitive advantage and encourages use of these substances by other competitors; and
Whereas, Anabolic steroids can be used safely under medical supervision and have an accepted use in the treatment of several medical conditions, including certain anemias, hereditary angioedema, and breast cancer; therefore, be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland hereby universally and unequivocally condemns the use of anabolic steroids to enhance athletic performance;
RESOLVED, That anabolic steroids be used only under the prescription of a licensed physicians for medically indicated purposes; and be it further
RESOLVED, That the Medical and Chirurgical Faculty work with the office of the Governor, as well as with the state legislature in all efforts to endorse educational activities aimed at appropriate interested individuals such as sports group administrators, coaches, trainers, parents, and athletes to curb the nonmedical use of anabolic steroids.

The Reference Committee recommends adoption of this resolution.

Resolution 2S/89 - Subject: Medical Care Review

Whereas, The physicians of the State of Maryland are under continuous pressures to reduce the average lengths of stay of hospitalized patients, not only by the hospitals, but also from the numerous government agencies;
Whereas, The physicians of the State of Maryland are under continuous surveillance by third-party payors; Medicare, through its PRO, and the State of Maryland through its Medicaid contract;
Whereas, We are living in a litigious society in which any adverse or negative results are continually scrutinized by lawyers specializing in malpractice;
Whereas, The Health Care Financing Administration (HCFA) has devised a system of staging quality problems by levels of severity; and
Whereas, HCFA has labeled the level of severity as "medical mismanagement" whether or not it involves physician mismanagment;
Whereas, HCFA intends to mail letters concerning quality of care directly to the patients that could result in increasing the possibility of litigation; therefore, be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland strongly condemn HCFA's system of nomenclature because it would encourage an increase in law suits by de facto underwriting of legal decisions without due process of law; and
RESOLVED, That the Medical and Chirurgical Faculty of Maryland encourages "medical care review" for the purpose of improving the medical care of our state residents, but that this review process be one of education and rehabilitation, rather than the destructive process of encouraging litigation, which it condemns; and be it further
RESOLVED, That the Medical and Chirurgical Faculty of Maryland that represents all physicians in the State of Maryland and the state-of-the-art of medicine in Maryland, consult with the PRO (Delmarva Foundation for Medical Care) to clarify these issues so that the end result would not be to compound the malpractice crisis.

The Reference Committee recommends adoption of this resolution.

During deliberation by the Reference Committee, it was requested that if this resolution were to be adopted, consideration should be given to submitting it to the AMA. Report RR of the June, 1988 AMA House of Delegates contains 15 resolutions dealing with HCFA policies on the issues of "medically unnecessary" denial, intrusion on patient/physician relationships, medical denial of disputed claims, etc. This subject, therefore, is already addressed as AMA policy and would be duplicative if forwarded to the AMA for consideration.

Once again, the Reference Committee recommends adoption of this resolution.

This concludes the report of the Reference Committee.

MAX E. BYRKIT MD *ZORAYDA LEE-LLACER* MD

Ad Hoc Committee on Late Resolution

Mr. President and Members of the House of Delegates:

Resolution 5A/89, considered at the Faculty's Annual Meeting in 1989 was referred to an appropriate Faculty committee as follows:

After debate, a motion was adopted to refer the resolution (5A/89) to the appropriate committee of the Faculty for study and report back to the House of Delegates at its 1989 Semiannual Meeting.

Resolution 5A/89 read as follows:

Whereas, There are major forces in the delivery of health care in Maryland, which are denying the patient the right to free choice;
Whereas, The Federal Government has expanded its role in healthcare delivery by expanding the interpretations of the intent of the laws, without benefit of consultation with those delivering the care; and
Whereas, A steady decline in the quality of healthcare adversely affecting eligible Medicare enrollees is anticipated, while the costs are being caused to rise due to increasing administrative expenditures; therefore be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland cause to be established a Maryland Healthcare Delivery Alliance, consisting of the Faculty, the Maryland Hospital Association, the Maryland Nursing Association, and other statewide professional associations, in order to act as a unified voice, which would have greater effect than the individual groups themselves.

In a memorandum dated June 7, 1989, Raymond M.

Atkins MD, President, appointed five physician members to an Ad Hoc Committee to review late Resolution 5A/89, Establishment of a Maryland Healthcare Delivery Alliance.

After extensive deliberation, the Committee agreed that the proposed Healthcare Delivery Alliance in the original resolution was too encompassing and not sufficiently flexible to be practicable and workable in meeting the intent and application of this resolution.

Therefore, the resolution was modified and amended as follows (the recommended changes are indicated in CAPITAL LETTERS):

Whereas, There are major forces in the delivery of healthcare in Maryland, which are denying the patient the right to free choice; and

Whereas, The Federal Government has expanded its role in healthcare delivery by expanding the interpretations of the intent of the laws, without benefit of consultation with those delivering the care; and

Whereas, A steady decline in the quality of healthcare adversely affecting eligible Medicare enrollees is anticipated, while the costs are being caused to rise due to increasing administrative expenditures; therefore be it

RESOLVED, that the Medical and Chirurgical Faculty of Maryland seek the cooperation and support of other statewide professional associations involved with the medical care system, such as the Maryland Hospital Association and the Maryland Nursing Association, in order to have greater impact in shaping the medical care system than an individual group could have acting alone; and

RESOLVED, that these efforts be directed toward enabling physicians and hospitals to continue to deliver quality medical care and ensure access to that care; and, be it further

RESOLVED, that the Medical and Chirurgical Faculty of Maryland maintain communication with these professional groups in order to foster effective cooperation on issues of common concern.

The substitute language evolved from comments of each of the *ad hoc* members. The new language meets the intent of the original resolution as proposed by Prince George's Medical Society; namely, to encourage improved communication and cooperation of statewide professional associations involved in the health care system. It also gives the Faculty more flexibility in meeting the charge of the resolution.

At the same time, the new language avoids problems inherent in the original wording. As a practical matter, Med Chi can seek cooperation, but no one party can cause a coalition to be formed. In addition these same professional groups, and the MHA, in particular, very often have interests diametrically opposed or inimical to those of Med Chi. While that reality may not prevent cooperation on some issues, it may hamper efforts for a vital and successful coalition.

The Committee agreed that benefit can be gained by putting Med Chi on record as seeking cooperation and better communication with these other groups when appropriate issues arise and therefore recommends adoption of the substitute resolution as presented.

This concludes the report of the Ad Hoc Committee to review resolution 5A/89.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Commentary

The Hired Gun

The responsibility and qualification of a so-called expert medical witness is a subject most often debated in instances of professional liability. Such discussion usually emphasizes the familiar faces stabled by lawyers who specialize in medical malpractice and their testimony, which is usually favorable for the plaintiff. A close look at many physicians in this role shows that a substantial portion of their income is derived from medicolegal consulting activity. The argument presented here is not that physicians should not testify on behalf of patients and against physicians but that such witness stand the tests of scrutiny and review. Furthermore, when this activity is found to follow a pattern that does not reflect accepted medical practice standards, disciplinary action should be invoked..

We find some "experts" appearing so frequently in court that their actual clinical experience is questionable in view of time spent in legal consulting activities. Similarly, witnesses from academic settings, while highly trained and qualified on paper, may be unfamiliar with practice settings of limited resources and other circumstantial factors that bear on the care that might be rendered. The failure of the courts to identify foundational standards for qualifying a medical expert as an "objective unbiased critic" is identified as one of many factors eroding the standard of care by which physician defendants are judged.

Adding further to the erosion of expert medical testimony is the increasing visibility of contingent fee arrangements for physician consulting services now being marketed by national medicolegal consulting firms. It is obvious that a witness who participates in a contingent fee arrangement inevitably creates a situation where his/her role as an expert resource to the court may be compromised by personal financial concerns. While the law in most states prohibits direct payment of contingent fees to professional experts, some attempt to avoid such laws by offering managerial assistance for a contingent fee while maintaining an hourly fee structural for the actual consultants they supply.*

In addition to endangering the objectivity of the expert witness, contingent fee agreements with witnesses or consulting firms also inhibit the compensation goals of the tort system. The civil justice system has evolved into a process that is exceptionally generous in paying its professional participants and yet inefficient and too often arbitrary in compensating persons injured by medical negligence. If every witness in complex litigation were empowered to negotiate a contingent fee, there could be virtually nothing remaining for a plaintiff. It is a joint responsibility of the medical and legal professions, the judiciary, and state legislatures to protect with appropriate regulation the claimant's ability to obtain compensation at a reasonable fee for injuries caused by the fault of a health care provider.

At the recent annual meeting of the House of Delegates of the American Medical Association, the Pennsylvania Delegation submitted a resolution derived from a set of guidelines offered by the American College of Obstetricians and Gynecologists. These define the expert medical witness as follows:

1. The physician should have current experience and ongoing knowledge in the areas of clinical medicine about which he or she is testifying.
2. The physician's review of medical facts should be thorough, fair, and impartial and should not exclude any relevant information in order to create a view favoring either the plaintiff or the defendant.
3. The physician's testimony should reflect an evaluation of performance in light of generally accepted standards, neither condemning performance that clearly falls within generally accepted practice standards nor endorsing or condoning performance that clearly falls below these standards.
4. The physician should make clear distinction between medical malpractice and medical maloccurrence. The practice of medicine is a mixture of art and science, and is a dynamic and changing discipline based to a great extent on concepts of probability rather than on absolute certainty.
5. The physician should make every effort to assess the relationship of the alleged substandard practice to the outcome, since deviation from a practice standard is not always causally related to a bad outcome.
6. The physician should be willing to subject transcripts of depositions and courtroom testimony to peer review.

It is the opinion of many commentators that expert testimony should be treated as a scholarly endeavor

---

* Maryland State Bar Association Code of Professional Responsibility: DR 7-109(C) provided that a lawyer shall not pay, offer to pay, or acquiesce in the payment of compensation to a witness contingent upon the content of his testimony or the outcome of the case. But a lawyer may advance, guarantee, or acquiesce in the payment of:

(1)Expenses reasonably incurred by a witness in attending or testifying.

(2)Reasonable compensation to a witness for his loss of time in attending or testifying.

(3)A reasonable fee for the professional services of an expert witness.

and as such should be the subject of review by medical associations and medical licensing boards. Furthermore, since providing expert testimony is part of the practice of medicine it should be within the purview of state medical board regulation and professional peer review activities.

The recommendation to state medical societies that legislation addressing "expert medical witnesses" be promoted seems only logical. While their provisions may vary, they should include:

1. some minimum training requirement in the specialty or medical field at issue in the liability claim;
2. time parameters for active clinical experience and/or teaching experience within one to five years of the date of the occurrence giving rise to the claim to assure up-to-date knowledge and skills; and
3. geographical limitations on the residence of the expert or the requirement that an out-of-state expert is familiar with the standard of care in the state where the alleged negligence occurred.

To prevent physicians who may be biased by their financial interests, a recent decision by the Illinois Supreme Court in the case of *Trower vs. Jones*, 121 Ill. 2d 211 (1988) appears preferable. *Trower* upheld a trial court's discretion to allow cross-examination on the following issues:

1. the amount of compensation received for the expert's consultation and testimony;
2. the frequency of the physician's expert witness activities;
3. the proportion of the physician's professional time devoted to and income derived from such activities; and
4. the frequency with which he or she testified for either plaintiffs or defendants.

In conclusion, expert medical witnesses should be encouraged to seek peer review of their opinions, as they would scholarly articles or other activities that do not involve the rendering of patient care. The best venue for conducting this activity would appear to be the setting in which established peer review mechanisms already exist. For most physicians, this activity occurs within the medical center, teaching facility, or other locus where they practice or are employed.

FAX: (301) 583-8091

Dear Physican,

Medical Mutual Liability recently terminated over 500 insurance brokers, giving physician insureds two choices — (1) Deal directly with Med Mutual, or (2) Find another broker.

William C. Garrett & Associates, specializing in professional liability insurance for over 20 years, is proud that we were among the select few brokers retained on the basis of Med Mutual's high standards for "Quality of Service" and premium volume and policy count.

Respectfully, we disagree with Med Mutual's intent to deal directly with physicians. We know from experience that physicians are neither trained nor inclined to become insurance brokers. We also believe that we play a vital role in cross-checking rates and applicable coverages…in advising physican insureds of rule changes that impact them…and of representing the physician's best interests when differences of opinion arise.

Call it part of a system of checks and balances…or think of it as a second opinion when your financial security is at risk. Whatever, it makes sense to deal with a broker like William C. Garrett who can provide the full benefit of 20 years of experience and service.

Best of all, it won't cost you one additional cent. Your premiums will be the same whether you deal direct with Med Mutual or through William C. Garrett.

If your broker was among those terminated…or if you simply prefer to deal with a specialist in medical malpractice insurance …talk to us! It's as simple as calling 1-800-458-7295. For the quickest possible service, simply retype the Broker of Record letter shown below and send it to William C. Garrett. You have our assurance we'll do the rest!

Sincerely,

William C. Garrett

Management of Cocaine Abuse in Methadone Maintenance Programs

Efficacy studies of methadone maintenance treatment for opiate addicts have demonstrated clients' decreased opioid use, lessened crime, and improvement in employment.[1] Recently, cocaine abuse by opioid addicts being treated with methadone has been increasing. The rate of cocaine use in New York City methadone maintenance programs had more than tripled from 1974 to 1979.[2] Twenty-six percent of the urine samples collected from these programs contained cocaine metabolites. In 1986, Kosten et al. reported on a cross-sectional comparison of opioid addicts applying for treatment from 1978 through 1980 with former heroin addicts in methadone maintenance.[3] Seventy-four percent of opioid addicts applying for treatment and 20 percent of the methadone sample had used cocaine in the last 30 days. Results of a 2.5 year follow-up of the opioid addicts who had applied for treatment between 1978 and 1980 showed that cocaine abuse had only minimally reduced and the number of clients using cocaine at least weekly had doubled since intake.[4]

The Maryland Substance Abuse Management Information Services reported that of the 3,655 statewide methadone treatment admissions, 47.9 percent had problems reported with cocaine in addition to an opiate drug.[5] This is an increase from 1986, (43.0 percent), and essentially the same percentage as 1987 (48.6 percent). Statewide, there were 3,183 methadone discharges in 1988. Of the total discharges, 1,730 (54.4 percent) left with cocaine problems. Presently there is no nationwide tabulation of cocaine abuse among methadone maintenance patients.

Intravenous Cocaine Use and HIV

Replacing intravenous (IV) heroin with oral methadone is a benefit of methadone maintenance because of reduced risk of the spread of HIV infection and of other viruses through needle and paraphernalia sharing.[2] Most opioid addicts inject cocaine intravenously. Thus, cocaine use threatens the social gains and decreased intravenous drug use attributable to methadone maintenance treatment.[3] When Chaisson et al. assessed 633 heterosexual IV drug users from nine outpatient detoxification or methadone maintenance programs in San Francisco,[4] they found that IV cocaine use significantly increased the risk of HIV infection, with a seroprevalence of 35 percent in daily cocaine users.

Reponses to Cocaine Use by 12 Methadone Programs

A recent study surveyed 12 methadone maintenance treatment programs (MMP) in the Baltimore-Philadelphia area to determine the treatment methods MMP staff use when a client is found to use cocaine, usually after a routine urine drug screen tests positive for cocaine. These include increased counseling; loss of privileges (that is, take-home methadone doses); increased urine testing; contingency contracting that specifies that a methadone dose will be reduced for each urine positive for cocaine, review of the treatment plan, mandatory hospitalization, referral to specific cocaine treatment centers, Narcotics Anonymous (NA) and/or Alcoholics Anonymous (AA), or Cocaine Anonymous; and contingency contracting such that their treatment plan specifies the client will be administratively discharged if the client has one more positive urine during a specified time period.

All of the 12 programs increase the number of counseling sessions after a client submits two or more cocaine-positive urines. This may be group or individual counseling or both. Therapy is usually supportive and directive though relapse prevention and relaxation therapy are used as well at some programs.

Urine testing at the 12 programs for a client with no infractions occurs an average of 1.7 times a month. Overall the frequency of urine testing for cocaine in clients known to abuse cocaine ranged from a maximum of 4 times a week to 8 times a year. Furthermore, MMPs not only obtain urine drug screens at varying times but also they use different analytical methods with different sensitivities: thin layer chromatography (TLC), which detects cocaine metabolite in urine up to 12 to 24 hours after a dose of cocaine, or Enzyme Multiplied Immunoassay Technique (EMIT), which detects cocaine metabolites up to 48 hours after a cocaine dose.[6] The MMPs are moving toward increased use EMIT.[7] This change results in increased expense at a time when governments' subsidies for urine toxicology have been cut back, forcing the programs to rely more on client fees to pay for testing. Unfortunately, this situation often results in decreased frequency in urine testing of the client population. The MMPs tend to target individuals known or suspected to abuse cocaine for more frequent urine toxicology.

All programs terminate take-home methadone doses after a client submits a cocaine positive urine. One justification for discontinuation is the possibility of diversion. Methadone sells for approximately one dollar a "gram" on the streets in Baltimore. The approximate street value of cocaine powder in Baltimore is $100 per one "gram." It is sold in amounts as small as "dime" ($10) bags, which addicts report amounts to 1 to 3 intravenous injections.

Contingency contracts that call for a reduction in methadone dose with each positive urine sample are controversial. Stitzer et al. found that aversive consequences appeared to promote dropout.[8] Three of the

12 programs use this intervention; two other programs discontinued using dose-lowering contracts.

All 12 programs rely on hospitalization for patients with acute medical and psychiatric sequelae of cocaine use. They differ, however in their criteria for referral of the cocaine-abusing client for inpatient detoxification, usually a seven-day stay, which is often difficult to arrange. Few hospitals will maintain a patient on methadone during a cocaine detoxification. Referral is expedited if the client is motivated to discontinue cocaine or is "on a run" using cocaine excessively daily. Cocaine abstinence can occur after inpatient detoxification but relapse is common.

Discharge from Treatment Because of Cocaine Use

The MMPs' policies vary for detoxification from methadone and for discharge from the MMP due to cocaine abuse. All programs discharged cocaine using clients for noncompliance of general programs rules: failing to keep individual or group counseling appointments, missed methadone doses, not paying clinic fees, and acts of aggression. A member of the study survey staff reviewed each program's records with the MMPs' directors and staff to ascertain how many clients were discharged for cocaine use in the previous month and the previous year. The results do not include client discharge due to behavior infractions that may be related to cocaine use. The percentage of clients discharged for cocaine use per program during the prior month was 0 to 5 percent. In the preceding year, 0 to 67 percent of clients were discharged for cocaine abuse per program per year. The discharged cocaine users equaled 20 percent of the total methadone maintenance population studied.

Discharging a cocaine-abusing client who continues to use cocaine despite increased counseling, urine testing, loss of take home methadone doses privilege, and other therapeutic interventions poses a no-win situation. The client is almost certain to return to IV heroin use increasing the likelihood of behaviors that increase the risk of infection with HIV and other viruses such hepatitis. To keep clients in methadone treatment when they continue to use cocaine, however, may be seen as subtle acquiescence by the clients.

Comments

Intervention with this group of addicts requires intense staff involvement and expensive urine testing. At risk are clients' social functioning, employment, and decreased crime days, as well as their physical health, risk of HIV, and other infections. Methadone maintenance treatment programs now use multiple therapeutic techniques. More clinically applicable research is needed to help develop guidelines for urine testing, counseling, and other therapeutic interventions.

Short-term interventions in the battle against AIDS deserve attention but must not preclude funding and investigation of longer-term treatment, particularly given the relapsing nature of opiate and cocaine abuse. A climate of productive collaboration between these front-line workers, the MMP staff, medical researchers, and policy makers is crucial.

Acknowledgments

This study would not have been possible with out the excellent effort and time of the staff and directors of the 12 treatment programs.

Inflammatory Carcinoma of the Breast: Part I

Inflammatory carcinoma of the breast constitutes 1 to 4 percent of all primary breast cancer in the United States.[1] There are no known specific etiological factors for this disease. It has no race or age predilection, and occurs in premenopausal as well as postmenopausal women. It has never been reported in men. A positive family history is not present over 50 percent of the time. However, higher incidences of inflammatory carcinoma of the breast ranging from 25 to 55 percent have been reported in other countries.[2] This raises the questions of whether noninflammatory carcinomas are being misdiagnosed as inflammatory or whether there could be epidemiological factors that may reflect on the patient population. In either case, this may affect the results of the management.

Inflammatory carcinoma of the breast is a clinical entity characterized by acute onset of erythema, edema, and increase of the local heat of the skin of the breast. The onset may mimic acute mastitis, a condition from which it should be differentiated. The extent of the erythema and edema may vary. According to the Institute of Gustave-Roussy, if the erythema and/or edema involves the whole breast, it is referred to as PEV3. On the other hand, if the erythema and/or edema are localized, it is called PEV2. Such differences may reflect on the survival.[3]

In most instances, the onset may be accompanied by painful tender breast. The physical examination may reveal a hard mass in the breast 50 to 60 percent of the time, however, the clinical manifestations of the disease may be present with no palpable breast masses.

Inflammatory carcinoma of the breast tends to metastasize early in the course of the disease to the regional lymph nodes as well as systemically. Therefore, the patient usually presents with palpable axillary lymph nodes, and sometimes with enlarged supra-clavicular lymph nodes. The clinical course of the disease is fast and progressive. If left untreated, it will ulcerate and fungate through the skin of the breast within weeks from the onset.

Rare forms of presentation may include concomitant inflammatory carcinoma of both breasts or local recurrence after mastectomy in the skin flaps over the anterior chest wall. Mammography and thermography play no major role in establishing the diagnosis. Mammography usually reveals nonspecific opacification of the involved breast. Thermography expresses heat in the affected breast. Neither test can differentiate inflammatory carcinoma from acute mastitis.

Diagnosis

Inflammatory carcinoma of the breast is not a pathological diagnosis but a clinical one. Therefore, the pathologist will not report such diagnosis. Histopathologically, it is a poorly differentiated carcinoma of the breast. It usually presents with invasion of the lymphatic and blood vessels of the subcutaneous tissue and skin. However, the presence of erythema of the skin clinically and breast carcinoma on biopsy will establish the diagnosis even if no tumor emboli are noted in the blood vessels or lymphatics of the subcutaneous tissue and skin. While the majority of the patients, if not all, will have regional lymph node metastases, over one third will have gross evidence of distant metastases at the time of the diagnosis. Therefore, the disease can be considered as a systemic disease from the start.

Prognosis

The overall prognosis is poor. The disease has a potential for early local invasion and early regional and systemic metastases. The extent of the erythema and edema of the skin of the affected breast may reflect on the prognosis.[3] Controversy still exists on the diagnostic and prognostic values of the presence or absence of tumor in the lymphatics and blood vessels of the subcutaneous tissue and skin of the breast. Another poor prognostic sign is the presence of axillary lymph node metastases in most of the patients at the time of diagnosis. As mentioned before, over one-third of the patients have gross evidence of distant metastases initially, which again carries very poor prognosis. Futhermore, over 80 percent of these tumors are estrogen and progesterone receptor negative.[4] The other 20 percent who have estrogen or progesterone receptors positive (that is, 10 fml/mgm protein or higher) have low levels of positivity. Finally, failure to respond to the initial therapy signifies extreme short survival.

The Role of the Medical Monitor

More and more physicians are becoming involved in clinical drug trials. As questions posed by the Food and Drug Administration become increasingly complex, clinical trials grow larger and more complicated. Community physicians, especially those with busy practices, are being asked to provide centers for multicenter studies.

For many of these physicians, this will be their first encounter with *medical monitors*—physicians employed by pharmaceutical companies to coordinate and supervise clinical trials.

Increasingly, physician-employees are **not** semi-retired doctors opting out of physically demanding practices but are recently qualified board-certified or board-eligible specialists and subspecialists (some straight from residency and fellowship programs) who are excited by the challenges of this new career option. The medical monitor position combines the intellectual stimulation of basic science and preclinical research with the opportunity to be on the cutting edge of medical advancement and work with the clinicians who will shape the practice of medicine in the 1990s and beyond.

The medical monitor in a new job usually starts by taking over an ongoing study. The new industry physician learns how to visit study sites and how to examine case report forms for completeness and accuracy. The new monitor ensures that no protocol violations have occurred and that no serious adverse reactions have been overlooked.

As the medical monitor gains experience, some activities may be delegated to a clinical research associate, freeing the monitor to concentrate on other tasks such as writing new protocols, starting new trials, and evaluating, reporting, and presenting results from previous studies. Other activities include writing development plans for new products coming form the labs and writing all-important New Drug Applications (NDAs) to obtain FDA approval for marketing new pharmaceutical products in the United States.

Meanwhile, the medical monitor follows the relevant medical literature, attends major scientific meetings of his or her specialty, and consults with leading authorities on the disease or diseases targeted by the new medication. This may entail traveling around the country or around the world. If the drug is a very new one and as development proceeds, there probably will be a time when the medical monitor knows more about that drug than anyone else on earth.

Before a new trial begins the medical monitor and community physician investigator usually work together at pre-trial meetings to acquaint the monitor with the site and to iron out final protocol details. The monitor usually visits the site at intervals during the study and again at the end of the study for close-out. In addition, there probably will be some telephone conversations to discuss adverse experiences and to decide what to do with the occasional patients who don't quite fit or do not fit the protocol's inclusion/exclusion criteria.

Finally—if the study and the program are successful—medical monitor and investigator will meet once more, this time to discuss the journal article, symposium presentation, or NDA submission that may someday serve to introduce another new drug to patients and community physicians.

a **CORNING** Clinical Laboratory

One Minute With Diabetes

Shin Spots

Doctor, What causes the brown spots on my shins? If they are scars from bruises, why do they not go away gradually? Are they related to my diabetes?

Small (about 5 to 12 mm in diameter) round brownish, atrophic, and circumscribed lesions on the skin of the lower extremities have been noted in diabetic patients for many years. They may be isolated or in groups, vary in number, and are usually bilateral. They are not painful and do not ulcerate. Patients often assume they are the result of an injury but often cannot recall any trauma to the area.

There seems to be an increased frequency of these lesions with an increased duration of diabetes. They are twice as common in males as in females. They rarely are observed in people without diabetes. Almost all patients with this dermopathy commonly called "shin spots" also have retinopathy and peripheral vascular disease. It has been suggested that the small blood vessel lesions in this condition are the same as those seen in Necrobiosis Lipoidica Diabeticorum (NLD) but at an earlier stage and with much less severity of the collagen changes. However, on inspection, there seems to be no surface relationship between the two conditions. NLD is seen almost exclusively in females with diabetes.

No specific treatment is known or indicated. If the spots are cosmetically objectionable, a skin cover preparation can be used. If your diabetes is not well controlled, better control is certainly indicated. However, even with excellent control, the brown spots probably will not disappear or change in appearance.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-In format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.
Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

Medicine in the Soviet Union

This past summer we traveled to the Soviet Union with a group from the Southern Medical Association. As a spouse, I did not attend the Physicians Seminars. However, during group discussions led by the Cultural Consultant and tour guides I did learn something about Soviet medical care. Some of the questions asked and the answers given were as follows:

How does one get to be a physician?
A person applies for a qualifying examination for Medical School. If one passes that exam he/she is automatically accepted and all schooling is free. Approximately 80 percent of Soviet physicians are female.

How does one get to be a specialist?
After applying to take a qualifying examination and passing, one proceeds with the specialized program. If one fails the exam, he or she continues working at the current level of training or reapplies for another qualifying exam at any time either in the same or another field of medicine.

Is it true that a bus driver gets a greater salary than a physician? Why?
A bus driver gets about 300 rubles ($450) per month and a physician 200 rubles per month. The rationale is that the physician's occupation is more satisfying than that of a bus driver. So 200 rubles plus satisfying reward of patient care equals 300 rubles, the salary of the bus driver. Remember the training for both is free. Committees of trade organizations adjust wages, and they are revised constantly but very little at one time.

Can a pregnant woman get an abortion?
Anytime a pregnant woman requests an abortion it is done. The total population of Russian women average seven abortions per lifetime. Russian people cannot understand all the discussion Americans have about abortions. Planned parenthood types of programs are just beginning to be available.

Who decides when a patient is to be admitted or discharged from a hospital?
The physician decides. Who else is capable of making that decision?

If a patient feels he/she has been mistreated by a physician or a hospital, what recourse is there?
A patient may change from one physician to another just by having records transferred. If a patient feels that he/she has been mistreated by a physician or a hospital he/she may file a complaint with a medical review board. If the board finds the physician or hospital did mistreat a patient a penalty is assessed and the money goes to the state, just as does a fine for "speeding" in the United States. The patient gets nothing.

Do you have a shortage of medical equipment?
There is a severe shortage of currently used medical equipment and of access to that equipment, but the situation is improving.

Is acupuncture used much?
Acupuncture is being evaluated mostly in the area of research at this time. It is not commonly used. (This applies to Moscow and Leningrad. What happens in other Soviet states is not known.)

How many nurses are assigned to how many patients?
On one general medical floor there is one nurse to care for forty patients. All patients go to a dining room on the same floor for meals.

Do patients wear identification bracelets?
No, we know our patients well from our close contact with them and such identification is not necessary.

As one can observe from our questions, there are differences in medical care between the United States and the Soviet Union. In the area of who determines when a patient enters or leaves a hospital the Soviets are ahead, but in medical equipment and supplies we are ahead.

One last interesting point, Hospital #28 in Leningrad is situated in the center of a large cemetery. We were told that the cemetery dates to the early nineteenth century while the hospital is only 50 years old.

MRI UPDATE

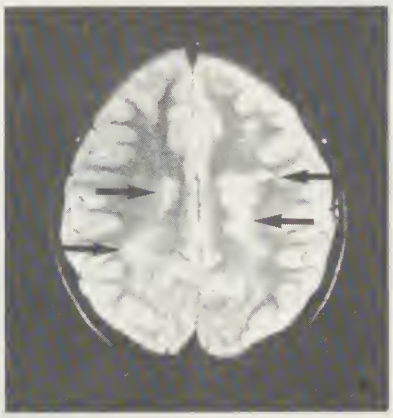

Figure 1

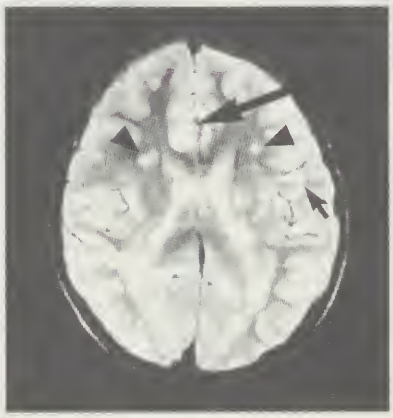

Figure 2

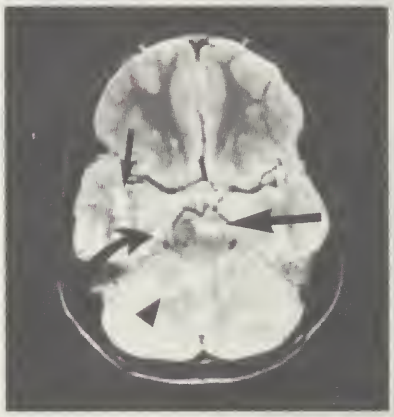

Figure 3

CLINICAL INFORMATION: Recently, there has been much discussion in the literature of the neurological symptoms caused by the spirochete borrelia burgborferi. The disease is transmitted by a tick bite and is associated with clinical symptoms of headaches, multiple arthralgias, and non-specific neurological symptoms. Given the appropriate clinical history, a diagnosis of Lyme disease can readily be confirmed by an MR scan.

FINDINGS: Figure 1 is a T2-weighted axial image through the brain. Abnormal focal areas of increased signal intensity can be identified within the centrum semiovale bilaterally (small arrows). These lesions are primarily located within the white matter but are of differing sizes. Figure 2 is also an axial image through the brain but at a level through the lateral ventricles. This section shows a lesion located within the medial gray matter of the right frontal lobe anterior to the corpus collosum (large arrow). Additional areas of abnormal increased signal intensity can be identified adjacent to the occipital horns, in the gray-white matter interface of the left parietal operculum (small arrow), and in the deep white matter of the frontal lobes in the region of the anterior corona radiata (arrowheads). Figure 3 is through the posterior fossa as well as the lower frontal and temporal lobes. Abnormal areas of increased signal intensity are demonstrated in the left anterior pons (large arrow) in the anterior right temporal lobe (small arrow), in the right cerebellar peduncle (arrowhead), and in the medial right temporal lobe (curved arrow).

The MR images clearly demonstrate the predominantly white matter involvement, multi-focal nature, and the absence of mass effect associated with these lesions. In the absence of clinical history, the MR appearance would be most consistent with a demyelinating process such as multiple sclerosis. However, as this case presented in a nine year old male following exposure to ticks, the differential diagnosis becomes that of Lyme disease. The diagnosis was further confirmed by the findings of similar, although less extensive lesions, in the patient's sibling.

COMMENT: The patient in the case above had a CT scan prior to the MR study which was negative. This case clearly demonstrates the increased sensitivity of MR over CT in detection of white matter processes. However, the case also demonstrates the relative non-specificity of the findings. In this case, the clinical history was most important in determining the true etiology of the patient's findings.

Maryland Magnetic Imaging
900 Toll House Avenue / Frederick, MD 21701

AMA Honors Governor Schaefer for Outstanding Public Service

In October 1989, as a result of Med Chi's nomination, Maryland Governor William Donald Schaefer became one of the first recipients of the American Medical Association's Dr. Nathan Davis Award for Outstanding Public Service.

The AMA initiated the Dr. Nathan Davis Awards, named after the founder of the AMA, to recognize contributions by public servants promoting the art and science of medicine and the betterment of public health. It seems appropriate that this distinguished award should be presented to Maryland's most preeminent public servant because the AMA held its first official meeting in Baltimore in 1849.

Med Chi nominated Governor Schaefer for this award because of his consistent actions as an outstanding friend to the people in promoting quality health care. One of the Governor's first challenges after assuming office in January 1987 was dealing with skyrocketing liability insurance premiums that were forcing many Maryland physicians out of the practice of medicine. Since obstetricians were most severely affected, a group of obstetric patients in a small rural town asked the state for help. The Governor quickly gathered representatives from Med Chi, the Maryland Hospital Association, as well as other health care organizations and traveled to Easton where he spoke reassuringly to the expectant mothers and personally assured them he would do everything possible to maintain the physician/patient relationship and continue to provide an environment where physicians and patients can enjoy confidence in one another.

Because of this experience, tort reform became one of Governor's Schaefer's top legislative priorities. In 1988, after the preliminary defeat of a malpractice reform bill, he again consulted with physicians from the Medical and Chirurgical Faculty of Maryland and later used his leadership to insure that this bill and concomitant pieces of legislation were reexamined. Due to his personal involvement, a measure was passed that significantly reduced soaring malpractice insurance premiums.

His concern for the liability insurance plight of physicians and patients was evident again in November 1988 when he announced that, as a result of his tort reform, the largest insurer of private practice physicians in the state would provide a discount to its

policyholders who renew their policies in 1989. Maryland physicians are still feeling the effects of this tort reform today. In October 1989, the Medical Mutual Liability Insurance Society announced that it will offer a 20 percent dividend credit to all its members who renew their policies in 1990.

During the 1988 Maryland General Assembly, Governor Schaefer reiterated his concern for the patient and improved the state's medical disciplinary system by creating the board of Physician's Quality Assurance and by budgeting additional funds to strengthen the role of practicing physicians in conducting peer review as volunteer agents of the state.

During the 1989 legislative session, Governor Schaefer initiated many changes in current law while supporting the defeat of any change that would erode the quality of health care for Maryland citizens. His concern for the environment prompted him to support a bill prohibiting smoking in hospitals and another bill that would increase the fine for illegal dumping of infectious medical waste.

The spread of the AIDS virus led Governor Schaefer to appoint an advisory council on AIDS in 1987 that introduced an omnibus AIDS bill in 1989, which he strongly supported. Recently he signed bills prohibiting health professionals from discriminating against persons testing positive for HIV infection and making it a misdemeanor to knowingly spread the virus that causes AIDS.

Governor Schaefer spearheaded a war against drugs that spread through the Maryland legislature and resulted in the passing of several new drug laws including a law that allows authorities to seize the licenses of drunken drivers or drivers who refuse to take a blood-alcohol test. In addition, he introduced a package of bills that increases the penalties for drug "kingpins," broadens state authority to seize dealers' assets, sets stiff penalties for dealing near schools, and increases the authority of prosecutors to compel testimony by granting immunity.

In May 1989 Governor Schaefer held Maryland's first statewide drug summit where over 500 Maryland leaders met to develop new strategies to combat Maryland's drug problem. The conference resulted in an increased awareness of the scope of Maryland's drug problem and set forth guidelines for several new antidrug programs throughout the state. A second drug summit was scheduled to take place in November 1989.

The Governor's extensive legislative efforts and special programs throughout his term demonstrate his high regard for the health of Maryland citizens and show that the preservation of high professional standards are a top priority on his governing agenda. His efforts to insure the highest quality of medical practice and his courageous stands against formidable odds illustrate his strong support for the practice of medicine and the betterment of public health in Maryland.

The 1989 recipients of the Dr. Nathan Davis Award represent individuals who have significantly advanced the well being of the pubic health. Governor Schaefer was honored with other notable public figures including former Surgeon General C. Everett Koop MD, California US Representative Henry Waxman, and Former Senator Lowell Weicker from Connecticut. ■

The Big Deception. How Psychotherapy and Counseling Really Work. David W. Shave. Malabar, FL: Robert E. Krieger Publishing Co., Inc., 1989, 306 pp.

Our Salisbury, Maryland, colleague has written "specifically for the practicing psychotherapist or counselor," however, this book will prove of interest to many who share more generally an interest in areas of emotional health.

Throughout this well-written presentation Shave vigorously pursues his basic thesis that oral dependency needs and their vicissitudes are the significant features in emotional development, emotional comfort, and emotional discomfort. Thus he differs with many psychoanalysts who assign greater significances to sexual needs. This volume has evolved from prior expositions published in 1974, 1975, and 1979, which "provide the basis for this book."

In his carefully reasoned discussions, the author includes numerous illustrative vignettes from his two-and-a-half decades of psychiatric experience. He emphasizes the need for and value of the interested listener in the psychotherapeutic endeavor.

The "big deception" is of both the provider and the consumer, each of whom often fails to perceive the real underlying bases of the presenting problem, diagnosis, therapeutic success (or failure), and contributing relationships, as well as other important complex facets of psychiatry. Shave's excellent updated exposition is well worth reading.

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—

Healthcare
MERIDIAN

Med-Chi members reading papers before organizations are invited to submit their papers to the MMJ *for consideration for publication.*

The *Maryland Medical Journal* is the monthly publication of the Medical and Chirurgical Faculty of Maryland. Its goals are educational and informative: the publishing of scientific articles and other technical information as well as editorials, special articles (evaluations, position papers, reviews of nonscientific subjects), membership news, notices of medical events, legislative and governmental news, meetings, continuing education courses, and programs and policies of the Faculty.

Manuscripts may be sent to Editor *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by the editor, editorial board members, and guest reviewers. The final decision is reserved for the Editor.

Specifications

When submitting manuscripts for review by *MMJ*'s Editorial Board, please send an IBM compatible floppy disk with the document entered in a Word Perfect, Multimate, or Wordstar program. At your request, *MMJ* will return your disk after your article is published or if your manuscript is not accepted. Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with margins of a least one inch. Number pages consecutively. Please submit two additional copies.

Include in the manuscript the concise title, full name of the author (or authors) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

An introductory synopsis/abstract of approximately 100-150 words is required.

Race, creed, color, national origin, or religion shall not be included in descriptions of case reports unless such information is a necessary contribution to clinical understanding.

Tables are to be typed on separate sheets of paper, numbered, and have a brief descriptive title. The Editor reserves the right to edit tables. Be sure that statistics are consistent in both tables and text.

References are limited to those citations noted in the text. References are to be typed double-spaced and numbered consecutively as they appear in text. They will be examined critically at the time of review and must be kept to a minimum. The number of references is generally limited to 20 in major contributions and fewer in shorter articles. Exceptions may be made if appropriate in the opinion of the reviewing editor. Personal communications and unpublished data should not be included. The following are necessary: names of all authors, complete title of article cited (lower case), name of journal abbreviated according to *Index Medicus*, volume number, first and last page numbers, and year of publication. For more extensive information about preparing medical articles for publication, the editors suggest the International Committee of Medical Journal Editors: Uniform requirements for manuscripts submitted to biomedical journals. The complete document is available in the June 1982 issue of the *Annals of Internal Medicine*.

Illustrations are material that cannot be set in type. *Photographic material* must be submitted as high-contrast, glossy prints. *Drawings and graphs* must be done professionally in india ink on high-grade white drawing paper or be computer generated. **Omit illustrations that do not increase understanding of text, and limit them to a reasonable number.** Four or fewer illustrations should be adequate for a manuscript of 4 to 5 typed pages. Identification should be typed on a gummed label and affixed to the back of each illustration: figure number, title of manuscript, name of senior author, and arrow indicating top. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs and drawings. **Cost of printing color photographs must be borne by the author.**

Recognizable photos of patients are to be masked and should carry with them written permission for publication.

Permissions. When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright. Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the author and *MMJ*.

Editorial Responsibility

Manuscripts are subject to editorial modification and such revisions necessary to bring them into conformity with *MMJ* style.

Galley proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Statements made or opinions expressed by any contributor in any article or feature published in *MMJ* are the sole responsibility of the author. ■

In the Matter of
Thomas N. Carter MD
Before the
Maryland Board of
Physician Quality Assurance

Intermediary Order
Superseding Board's Order
of June 21, 1988

Background

By Order (attached hereto) dated February 6, 1986 ("1986 Order"), the Board of Physician Quality Assurance ("the Board") successor agency to the Commission on Medical Discipline (the "Commission"), summarily suspended the license of Thomas N. Carter MD ("Respondent") to practice medicine in the State of Maryland. By Order (attached hereto) dated June 21, 1988 ("1988 Order"), the Board found the Respondent guilty of committing a prohibitive act as set forth in Health Occupations Article, *Annotated code of Maryland* §14-504(4), "is professionally...incompetent." Specifically, the Board found that Respondent's cognitive knowledge was deficient with respect to the prescribing of controlled dangerous substances; that Respondent's prescribing practices were deficient in terms of examination, follow-up, and control; and that certain patients, if they were not already addicted to controlled dangerous substances of the type prescribed by Respondent, were caused to continue to maintain their addiction through Respondent's grossly deficient prescribing practices. The Commission found that Respondent's prescribing practices were not undertaken in a fraudulent or deceptive manner to cause or continue addiction but rather that Respondent exercised a gross lack of judgment in treating patients with chronic pain. The Board suspended Respondent's medical license indefinitely pending his successful completion of an approved course in pharmacology. The 1988 Order provided that upon satisfactory completion of an approved course in pharmacology, the Respondent could petition the Board for a stay of the indefinite suspension of his license. The 1988 Order further provided that in the event the Board stayed the indefinite suspension of Respondent's license, Respondent could apply for reinstatement of his license without any conditions whatsoever in three (3) years, conditioned upon Respondent's submitting proof of successful completion of probation. By petition dated February 9, 1989, Respondent petitioned the Board to stay the indefinite suspension of his license and place him on probation.

Finding of Fact

Based on information known and available to it, the Board finds that:

1. On October 17, 1988 Respondent entered a retraining program in pharmacology at the Medical College of Pennsylvania, the nature, scope, and terms of which were approved by the Commission. The Commission received evidence in writing dated october 24, 1988 from the Assistant Director of Operations at the Medical College of Pennsylvania agreeing to provide bi-monthly evaluations of Respondent's progress.
2. Respondent submitted evidence that he had successfully completed the course set forth above on December 9, 1988.
3. On July 12, 1989, the Board voted to accept Respondent's completion of the retraining program at the Medical College of Pennsylvania Medical School s the condition precedent to petitioning the Board for a stay of the indefinite suspension of his license.

Conclusions of Law

The Board concludes, as a matter of law, that Respondent successfully completed the condition precedent to petitioning the Board for a stay of the indefinite suspension of his license to practice medicine in Maryland.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, effective 12th day of July 1989, it is this 18th day of September 1989

ORDERED that the indefinite suspension is hereby TERMINATED; and be it further

ORDERED that Respondent's license is suspended and that this SUSPENSION is immediately STAYED; and be it further

ORDERED that Respondent is placed on three (3) years probation from July 12, 1989 during which time Respondent's medical practice shall be evaluated every six (6) months with the first report due January 15, 1990. These peer reviews will emphasize but not be limited to the prescribing and recordkeeping aspects of Respondent's medical practice; and be it further

ORDERED that on July 12, 1992, the Board will entertain a petition for termination of Respondent's probationary status and reinstatement of Respondent's license to practice medicine in Maryland without any conditions or restrictions whatsoever. If Respondent has successfully complied with all conditions of probation and if there are no outstanding complaints or adverse peer review reports against Respondent, the Board will terminate the Conditions of Probation and reinstate Respondent's license without any conditions or restrictions whatsoever. However, if the Board determines that termination of probation is not appropriate, the Board may extend the probationary period and may modify one or more

conditions upon which Respondent was placed on probation; and be it further

ORDERED that this is a Final Order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

■ ■ ■

In The Matter of
Grace Yuncha Chong MD
Before the
Maryland Board of
Physician Quality Assurance

Consent Order
Background

On July 12, 1989, the State Board of Physician Quality Assurance (the "Board") charged Grace Yuncha Chong, MD ("Respondent") with violation of the Maryland Medical Practice Act (the "Act"), Title 14, Health Occupations Article, *Annotated Code of Maryland*. Specifically, the Board charged Respondent under §14-504(a)(3) of the Act which states:

> Subject to the hearing provisions of S14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee is guilty of immoral unprofessional conduct in the practice of medicine.

Specifically, the Board charged that Respondent did not provide general supervision to a registered acupuncturist in accordance with S14-605 of the Act and COMAR 10.32.05.08A(2) and (3).

Section 14-605(a)(3) of the Act provides that "general supervision" means the supervising, licensed physician shall:

> (1) Perform or review the results if a recently performed medical diagnostic examination with respect to any ailment or condition to be treated by acupuncture prior to such treatment;
> (ii)Be personally available for consultation on the premises or be available by telephone contact, chart review, or buy other means approved by the Board; and
> (iii) If required as a matter of sound medical practice, place conditions and restrictions on the course of treatment.

COMAR 10.32.05.08A provides:

> (2) In relation to the acupuncture patient, the supervising licensed physician shall:
> (a) Perform or review the results of a recently performed medical diagnostic examination with respect to any ailment or condition to be treated by acupuncture before the treatment.
> (b) Advise the patient of the results of the medical diagnostic examination and the treatment alternatives;
> (c) If required as a matter of sound medical practice, place conditions or restrictions on the course of treatment in acupuncture;
> (d) Advise the patient in writing that if the ailment or condition worsens or if a new ailment or condition appears, the patient should consult with his personal physician or any other licensed physician;
> (e) Advise the patient to consult with his physician if the course of treatment does not improve the condition during an estimated time provided by the acupuncturist at the initiation of treatment;
> (f) Advise the patient in writing that the supervising, licensed Physician is available at reasonable times for consultation by appointment or by telephone, and the written notice shall contain an address and telephone number at which the physician can be reached;
> (g) Advise the patient in writing that the supervising, licensed physician is not an acupuncturist and not qualified to direct the course of acupuncture treatment an does not have responsibility for the course of the acupuncture treatment.
> (3) The items set forth in §A(a)(d)-(g) above, shall be included in an informed consent from signed by the patient.

On August 2, 1989 settlement conference was held. As a result of negotiations entered into during the settlement conference, Respondent agreed to the following consent order.

Findings of Fact

1. At all times relevant to this Order, Respondent was and is currently licensed to practice medicine in Maryland.

2. On December 26, 1984, an applicant for registration as an acupuncturist submitted an affidavit to the Board of Medical Examiners ("BME") which was signed by Respondent as the supervisory physician. The affidavit stated:

> We have read the Acupuncture Regulations, COMAR 10.32.05 and will fulfill the responsibilities as set forth in the regulations for acupuncturists and for the supervisory physician.

3. On January 30, 1985, BME registered the acupuncturist with Respondent as the supervisory physician.

4. On June 9, 1987, Patient A* sought acupuncture treatment from the acupuncturist whom Respondent was supervising. The acupuncturist performed acupuncture on June 9, 12, and 16, 1987. A review of Patient A's records revealed that there was no written consent signed by Respondent and Patient A. Respondent did not give written approval to the acupuncturist to initiate acupuncture treatment.

5. Respondent agrees to plead guilty to immoral and unprofessional conduct in the practice of medicine because Respondent did not provide general supervision to a registered acupuncturist in accordance with §14-605 of the Medical Practice Act and COMAR 10.32.05.08A(2) and (3).

Conclusions of Law

Based upon the findings of Fact, the Board concludes as a matter of law that Respondent did violate Md. Health Occ. Code Ann. §15-504(a)(3) (1988 Cum. Supp.) and finds Respondent guilty of immoral or unprofessional conduct in the practice of medicine

*Patient names were not used in the Charging Document. The Board maintains a list of patient names which corresponds to the alphabetical letter used in the Charging document. The list was available to Respondent upon request.

because Respondent failed to provide general supervision to a registered acupuncturist in accordance with S14-605 of the Act and COMAR 01.32.05.08A(2) and (3).

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 16th day of August 1989,

ORDERED that Grace Yuncha Chong MD, a physician licensed to practice medicine in Maryland, is hereby formally REPRIMANDED; and; it is further

ORDERED that the Board accepts Respondent's voluntary assurance that Respondent will no longer supervise Hwal Chin Chong, a registered acupuncturist; and it is further

ORDERED that the Board accepts Respondent's voluntary assurance that Respondent will not apply to supervise any other acupuncturist for a period of three (3) years; and be it further

ORDERED that any public disclosure of the foregoing Findings of Fact and Conclusions of Law shall consist of the contents of this Order as permitted by Md. State Government Article Code Ann. §10-617(h)(1984).

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby accept and agree to be bound b the foregoing Order and its conditions and restrictions.

1. By signing this Consent, I hereby submit to this Order and its conditions. I acknowledge the Board's jurisdiction and the validity of this Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protection provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this Consent, I waive all such rights.

2. I understand that if I fail to comply with the conditions enumerated above, I may suffer disciplinary action against my license to practice medicine in the State of Maryland.

3. I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and terms of the Order.

GRACE YUNCHA CHONG MD

■ ■ ■

In the Matter of Hwal Chin Chong RA Before the Maryland Board of Physician Quality Assurance

Consent Order Background

On July 12, 1989, the State Board of Physician Quality Assurance (the "Board") charged Hwal Chin Chong RA ("Respondent") with violation of COMAR 10.32.04.09A adopted pursuant to the Board's authority* under Md. Health Occ. Code Ann.§14-605 (1988 Cum Supp.). Section 14-605 provides that subject to the hearing provisions of §14-505, the Board, on the affirmative vote of its full authorized membership, may reprimand or place an acupuncturist on probation or suspend or revoke the registration of an acupuncturist for any conduct prohibited under any regulation adopted pursuant to this section.

The pertinent provisions of COMAR 10.32.04.09A under which Respondent was charged provides as follows:

(1) In relation to the acupuncture patient, the registered acupuncturist shall:
  (a) Have received in writing from the supervising, licensed physician approval to initiate acupuncture treatment;
  (c) Obtain a copy of the signed consent required under COMAR 10.32.05.08A(3); and
  (g) Comply strictly with sterilization standards relative to aseptic practices.

COMAR 10.32.05.08A(3) provides that the supervising, licensed physician shall in an informed consent form:

(1) advise the patient in writing that if the ailment or conditions worsens or if a new ailment or condition appears, the patient should consult with his personal physician or any other licensed physician;
(2) advise the patient to consult with his physician if the course of treatment does not improve the condition during an estimated time provided by the acupuncturist at the initiation of treatment;
(3) advise the patient in writing that the supervising, licensed physician is available at reasonable time for consultation by appointment or by telephone, and the written notice shall contain an address and telephone number at which the physician can be reached; and
(4) advise the patient in writing that the supervising, licensed physician is not an acupuncturist and not qualified to direct the course of acupuncture treatment and does not have responsibility for the course of acupuncture treatment.

On August 1, 1989, a settlement conference was held. as a result of negotiations entered into during the settlement

*The 1988 General Assembly, by Senate Bill No. 508 and House Bill No. 855, merged the functions of the former Commission on Medical Discipline and the former Board of Medical Examiners into the new Board of Physician Quality Assurance. Section 3 of the new legislation provided that all regulations, proposed regulations, standards, and guidelines, transferred by the Act shall continue in effect under the State Board of Physician Quality Assurance until withdrawn, cancelled, modified, or otherwise changed pursuant to law.

conference, Respondent agreed to the following Consent Order.

Findings of Fact

1. At all times relevant to this Order, Respondent was and is currently registered to practice acupuncture in Maryland.

2. Respondent agrees to plead guilty to a violation of COMAR 10.32.05.09A(1)(a) failing to receive in writing from Respondent's supervising, licensed physician approval to initiate acupuncture treatment; and (c) failing to obtain a copy of the signed consent required under COMAR 10.32.05.08A(3).

3. Respondent agrees to voluntarily surrender his registration to practice as an acupuncturist in Maryland on August 17, 1989.

4. On June 9, 1987, Patient A** sought acupuncture treatment from Respondent for headaches and low back pain. Respondent performed acupuncture on June 9, 12, and 16, 1987. A review of Patient A's records revealed that there was not written consent signed by the supervising physician and Patient A; Respondent did not have written approval from the supervising physician to initiate acupuncture treatment.

6. On February 24, 1989, inspectors from the Board visited Respondent's office at 501 Stevenson Lane, Towson, Maryland. Respondent produced patient records, which consisted of a diagram showing needle insertion points. There was no medical data recorded. There was no patient consent form. There was no approval from the supervising licensed physician to initiate acupuncture treatment.

Conclusions of Law

Based on the Findings of Fact, the Board concludes as a matter of law that Respondent did violate COMAR 10.32.05.09A(1)(a) and (1)(c) by failing to receive in writing from the supervising, licensed physician approval to initiate acupuncture treatment and by failing to obtain a copy of the signed consent required under COMAR 10.32.05.08A(3).

The Board concludes that there are no grounds for action under COMAR 10.32.05.09A(a)(g) and hereby DISMISSES the charge pursuant to Md. Health Occ. Code Ann. §14-506(b) (1988 Cum. Supp.)

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 16th day of August 1989,

ORDERED that the Board accepts Respondent's voluntary surrender of his registration to practice acupuncture in the State of Maryland; and be it further

ORDERED that Respondent shall not practice as an acupuncturist until such time as he applies for reinstatement of his registration to practice acupuncture. In the event that Respondent applies for reinstatement, the Board has complete discretion to grant or deny Respondent's application. NOTHING IN THIS ORDER SHALL BE CONSTRUED AS A PROMISE BY THE BOARD TO REINSTATE RESPONDENT'S REGISTRATION TO PRACTICE ACUPUNCTURE; and be it further

ORDERED that any public disclosure of the foregoing Findings of Fact and Conclusions of Law shall consist of the contents of this Order as permitted by Md. State Government Article Code Ann. §10-617(h)(1984).

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby accept and agree to be bound by the foregoing Order and its conditions and restrictions.

1. By signing this Consent, I submit to this Order and its conditions. I acknowledge the Board's jurisdiction and the validity of this Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protection provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this Consent, I waive all such rights.

2. I sign and consent to this order after having an opportunity to consult with counsel and with full understanding of the meaning and terms of the Order.

HWAL CHIN CHONG RA

■ ■ ■

In the Matter of William A. Landes MD Before the Maryland Board of Physician Quality Assurance

Order Terminating Probation and Reinstating License

Background

By Order (attached hereto) dated December 16, 1980 ("1980 Order"), the Board of Physician Quality Assurance (the "Board"), successor agency to the Commission on Medical Discipline, suspended the license of William A. Landes MD (the "Respondent") to practice medicine in the State of Maryland. By Order (at-

**Patient names were not used in the Charging Document. The Board maintains a list of patient names which corresponds to the alphabetical letter used in the Charging Document. This list was available to Respondent upon request.

tached hereto) dated May 5, 1981 ("1981 Order"), the Board found the Respondent guilty of committing a prohibitive act as set forth in Health Occupations Article, *Annotated Code of Maryland* §14-504. Specifically, the Board found that Respondent was guilty of addiction to narcotics or controlled dangerous substances [recodified as §14-504(a)(8) of the Health Occupations Article]. The Board revoked Respondent's medical license, immediately staying the revocation, conditioned upon the Respondent complying with terms and conditions (the "Conditions of Probation"). The Order further provided that if Respondent successfully completed his residency training program, the Board would entertain a petition for reinstatement of his medical license without any restriction or condition.

Findings of Fact

Based on the information known and available to it, the Board finds that:

1. In April 1988 Respondent applied for reinstatement of Respondent's license to practice medicine in Maryland. To document drug abstinence, Respondent provided the Board with evidence of voluntary participation and successful completion of a six (6) month urine screening program by the Committee for Physicians' Health Program of the Medical Society of the State of New York.

2. On September 14, 1988 the Board voted unanimously to reinstate Respondent's license to practice medicine in Maryland effective October 1, 1988. The material reviewed at that time included information which documented Respondent's recovery for six (6) years and that Respondent's prognosis for continued recovery was favorable.

3. Because Respondent had not petitioned the Board for an Order for Reinstatement and Termination, no reinstatement and termination order was issued. Respondent was informed of this, and on June 1, 1989 Respondent petitioned the Board for an Order that would terminate the conditions of probation and reinstate Respondent's license to practice medicine in Maryland.

4. At its meeting on June 28, 1989 the Board reviewed Respondent's petition. Although Respondent has not fulfilled the conditions of probation contained in the 1981 Order, the Board recognized that Respondent had truthfully and fully provided the Board in September 1988 with all information concerning Respondent's licensure status and concluded that no further action was necessary in light of the previous action to reinstate Respondent's license without restriction. The Board by this conclusion terminated the conditions of probation imposed in the 1981 Order.

Conclusions of Law

The Board concludes, as a matter of law, that Respondent's license to practice medicine in Maryland was reinstated effective October 1, 1988. Based on Respondent's reinstatement, the Board concluded that no further action is required on the Order of May 5, 1981.

Order

Upon the foregoing Findings of Factand Conclusions of Law, it is:

ORDERED that effective the 28th day of June 1989, the Conditions of Probation imposed upon Respondent's practice of medicine by the Board's 1981 Order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED that Respondent's license to practice medicine in the State of Maryland is REINSTATED without any condition or restriction whatsoever; AND IT IS FURTHER

ORDERED that this is a Final Order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance ■

In Appreciation

The members of the Editorial Board of the *Maryland Medical Journal* are most grateful to various specialists in the Maryland medical community who graciously contribute their time and expertise to the review of manuscripts for our publication. In 1989 the following physicians assisted in *MMJ*'s review process:

JOHN A. KASTOR MD
JOSEPH S. McLAUGHLIN MD
KENNETH B. LEWIS MED
LAWRENCE C. PAKULA MD
MYRON L. WEISFELDT MD
PAUL R. McHUGH MD
BRUCE A. REITZ MD

The Latest Government Figures On Health Care Costs Are In. And They Are Encouraging.

Some misconceptions exist that Medicare costs are spiraling out of sight, and that radical changes are needed to limit Medicare expenditures.

Unfortunately, the figures being quoted—that Medicare costs are increasing 17% a year—are out of date.

Department of the Treasury figures for the year 1988 show an increase of only 5.4%. And the first quarter of 1989, only a 5.2% annual rate.

While we are the first to say that these short term figures in themselves do not establish a trend, we believe that they are very encouraging.

The AMA is committed to improving the health care system and supports many of the proposed changes in the Medicare physician program.

As Congress enacts changes, we urge it to make decisions based on the most recent information available.

When it comes to sports fitness, we're on the ball.

Accidents happen . . . a high, overhead lob, a missed step, a too-quick turn. At PT&SFA, we specialize in musculoskeletal injuries, back care and sports related injury. And, along with therapy, we have provided preventative care to the Maryland community for the past seventeen years with eight convenient locations.

So, whether you're an eighteen year old tennis pro, or an eighty-year old grandma, PT&SFA has your fitness in mind.

Over 70% Leased

CRAIN TOWERS

- 84,000 sq. ft. 6-story executive professional office towers
- 1,000 to 13,000 sq. ft. available for lease.
- 4.3-acre site.
- Occupancy scheduled for November, 1989
- Professionally managed by Casey-Carey Winston, Inc.
- Three exterior glass elevator columnns.
- 3-story marble atrium lobby.
- Individually-controlled state-of-the-art design for personal compfort.
- Direct access to I-295, I-695, Route 3 and the new I-97.
- High visibility from Routes 100 and Business Route 3.
- Generous construction allowances
- Close proximity to North Arundel Hospital, BWI Airport, Marley Station Mall, Westinghouse, NSA, and Ft. Meade.
- On-site medical services including full service lab, radiology services, CAT Scan, and radiation therapy.
- Convenient parking for tenants and clients, with 359 parking spaces and an attractive sheltered marquise entryway.

VASOTEC®

(ENALAPRIL MALEATE | MSD)

VASOTEC is available in 2.5-mg, 5-mg, 10-mg, and 20-mg tablet strengths.

Contraindications: VASOTEC® (Enalapril Maleate, MSD) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASDTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Heart failure patients given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See DOSAGE AND ADMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in heart failure patients), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASDTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIDNS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident.

If excessive hypotension occurs, the patient should be placed in supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASDTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence ot inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See DDSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (> 5.7 mEq/L) was observed in approximately 1% ot hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patients, but was not a cause for discontinuation.

Risk tactors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use ot potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASDTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. It hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose ot enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the first few days ot therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes ot volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the sate and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose tor at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and DOSAGE AND ADMINISTRATIDN.)

Agents Causing Renin Release: The antihypertensive effect ot VASDTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence ot clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: A few cases ot lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation ot both drugs. Although a causal relationship has not been established, it is recommended that caution be exercised when lithium is used concomitantly with VASOTEC and serum lithium levels should be monitored frequently.

Pregnancy — Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies of enalapril in pregnant women. However, data are available that show enalapril crosses the human placenta. Because the risk of fetal toxicity with the use ot ACE inhibitors has not been clearly defined, VASOTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Postmarketing experience with all ACE inhibitors thus far suggests the following with regard to pregnancy outcome. Inadvertent exposure limited to the first trimester of pregnancy has not been reported to affect fetal outcome adversely. Fetal exposure during the second and third trimesters ot pregnancy has been associated with fetal and neonatal morbidity and mortality.

When ACE inhibitors are used during the later stages of pregnancy, there have been reports of hypotension and decreased renal perfusion in the newborn. Oligohydramnios in the mother has also been reported, presumably representing decreased renal function in the fetus. Infants exposed *in utero* to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support ot blood pressure and renal perfusion with the administration ot fluids and pressors as appropriate. Problems associated with prematurity such as patent ductus arteriosus have occurred in association with maternal use of ACE inhibitors, but it is not clear whether they are related to ACE inhibition, maternal hypertension, or the underlying prematurity.

Nursing Mothers: Milk in lactating rats contains radioactivity tollowing administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Satety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for satety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASDTEC has been found to be generally well tolerated in controlled clinical trials involving 2987 patients.

HYPERTENSION: The most trequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Dther adverse experiences occurring in greater than 1% ot patients treated with VASDTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

HEART FAILURE: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% ot patients treated with VASDTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% ot patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); cardiac arrest; pulmonary embolism and infarction; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis or cholestatic jaundice, melena, anorexia, dyspepsia, constipation, glossitis.

Nervous/Psychiatric: Depression, contusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIDNS and DDSAGE AND ADMINISTRATIDN).

Respiratory: Bronchospasm, rhinorrhea, asthma, upper respiratory infection.

Skin: Herpes zoster, pruritus, alopecia, flushing, photosensitivity.

Other: Vasculitis, muscle cramps, hyperhidrosis, impotence, blurred vision, taste alteration, tinnitus.

A symptom complex has been reported which may include fever, myalgia, and arthralgia; an elevated erythrocyte sedimentation rate may be present. Rash or other dermatologic manifestations may occur. These symptoms have disappeared atter discontinuation ot therapy.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause tor discontinuation ot therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation of therapy in 1.9% of patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIDNS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation ot VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% ot patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% ot patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g % and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause ot anemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases ot neutropenia, thrombocytopenia, and bone marrow depression have been reported.

Liver Function Tests: Elevations ot liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, it possible, be discontinued for two to three days before beginning therapy with VASDTEC to reduce the likelihood of hypotension. (See WARNINGS.) It the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

It the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision tor at least two hours and until blood pressure has stabilized tor at least an additional hour. (See WARNINGS and PRECAUTIDNS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASDTEC alone, a diuretic may be added.

Concomitant administration ot VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases ot serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose ot enalapril is recommended tor patients with a creatinine clearance >30 mL/min (serum creatinine ot up to approximately 3 mg/dL). For patients with creatinine clearance ≤30 mL/min (serum creatinine ≥3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum ot 40 mg daily.

Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASDTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) It possible, the dose of the diuretic should be reduced, which may diminish the likelihood ot hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent caretul dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range tor the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACDLDGY, *Pharmacodynamics and Clinical Effects.*) Dosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Heart Failure Patients with Renal Impairment or Hyponatremia: In heart failure patients with hyponatremia (serum sodium < 130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure*, WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.
